The only apparent way in which the automotive industry can combat this situation is to build more efficient vehicles—machines which travel much further per gallon of fuel. Better carburetion and vaporization systems are a step in the right direction, but only a step. We must have cars which are inherently more efficient—which travel more than twice as far per gallon of fuel as most cars now being turned out. It is not impossible. It is in fact well within the bounds of our present knowledge. It will, however, require study and experimentation and these require time. Therefore they must be started at once if the detrimental effects of a period of fuel stringency are to be mitigated or largely avoided.

We have published and shall continue to publish articles pointing the way toward more efficient engines and vehicles. Constructive comment in this connection from our readers will be appreciated.

## Measures to Create Employment

**I**N a recent issue of *AUTOMOTIVE INDUSTRIES* is an article setting forth the measures recommended at the President's Unemployment Conference for permanent relief from the present situation. Those measures, however, deal with questions of an economic nature, and, while they will have a direct bearing on the unemployment situation, they could scarcely be called emergency measures. There is little chance of any of the questions discussed becoming effective immediately, and the big problem confronting the entire country is how to lessen suffering during the coming winter months.

The conference did not forget this question, by any means, and the proposals made, if carried out conscientiously by industry, civic bodies and municipalities, will have an immediate effect in reducing the number of men who are out of jobs.

Aside from recommending a revival of the building industry, appropriations for more road building, co-operation of employment agencies, winter house cleaning and other relief measures, the conference suggested a few ideas for the manufacturer to consider. Among these suggestions were:

Part time work, through reduced time or rotation of jobs; manufacturing for stock; plant reconstruction and cleaning, with the consequent transfer of many employees to other than their regular work; reduction of the number of hours of labor per day; reduction of the work week to a lower number of days.

All these proposals can help the situation. Part time work will not give the workmen as much money as they are accustomed to, nor perhaps as much as they need, but it will at least keep them off the streets during the period of depression. The manufacturer is not the only one facing hard times, for his men are being forced to undergo privation and want until the factories of the land can return to their normal output. Plant reconstruction and cleaning could well be taken up at the present time, when only part time schedules are being operated upon.

## The Human Side of Industry

**"I** AM one of those who is strenuously opposed to any onslaught on organized labor at this time," said one of the best known and most respected engineers in the country the other day. "The American people," he went on to say, "are said to have a genius for organization. Regardless of what happens, workers, like every other class of our population, are going to have an organization of some kind. Organized labor at present is dominated by the higher types of skilled labor. If it were possible to destroy the present organization, there would be likely to arise in its place an organization dominated by the lower grades of intelligence comprised in the unskilled classes."

This is a point of view worth consideration, for other reasons as well as those given by this prominent engineer. Fundamentally the labor problem is not one of organization or of mass movements. It is distinctly a problem of individual study. The relation of the individual to his work, the opportunity which

that work gives for personal development and the factors of incentive involved are of primary importance in any consideration of the human element in industry.

There is no manufacturing problem more important in modern industry than this task of effectively adjusting the relation of the worker and his individual development with the ordinary work of industry. Only a certain part of the time of management can be spent in studying this important problem. It is essential, therefore, that as little energy be wasted as possible and that the time spent on the human problem be utilized constructively in study and experimentation rather than in mere battles for temporary advantage.

## More Air-Cooled Engines

**T**HAT we are on the threshold of renewed activities in the air-cooled field is quite evident. While much of this activity is no doubt caused by reports which have been circulated throughout the trade for a year or more that one of the largest companies in the industry has been developing a product with air-cooling, other interests have also been actively engaged in research along this line.

There is an increasing demand for higher thermal efficiency as one of the means of conserving fuel, and some engineers believe that air-cooled engines are inherently more efficient than the water-cooled type. It is quite certain that some things have been found out regarding air-cooling which will make it possible to overcome some of the few objections which have been offered to this type of engine. It is a significant fact that the one air-cooled car which has been manufactured in quantity has been highly successful and the earnings of this producer have been one of the remarkable accomplishments of the industry. It is certain that by the elimination of the water system, a certain amount of weight can be saved, which will have its effect on the economy. If the air-cooled engine runs at higher working temperatures it may, under certain conditions of operation, prove more economical. If the working temperature is higher than in the water-cooled car, there may be certain advantages in vaporization of the fuel which are also secured and which tend to increase the mileage possible per gallon of fuel.

Air-cooling in the past has been limited to a certain maximum size of cylinder, according to the views of many advanced engineers. However, it seems that discoveries which have recently been made in new cooling methods and particularly in increasing the effectiveness of the cooling fins may result in increasing the maximum cylinder size. If there is going to be a demand for smaller, higher economy cars, the average cylinder size will decrease and the difficulties of air-cooling will be lessened.

At any rate, we are surely on the eve of some important announcements in this field which will be anticipated with great interest by all automotive engineers. This is particularly true, as the field is not restricted to passenger cars, but covers trucks, stationary powerplants, tractors and aircraft as well.

# Eliminates Tire Mileage Guarantee

## Rubber Association Makes New Warranty

### Action on Product Claimed Defective Will Remain Optional With Makers

NEW YORK, Nov. 14—After an exhaustive consideration of the subject of mileage guarantees on tires, the tire manufacturers division of the Rubber Association of America has adopted the recommendations of a special committee providing for elimination of mileage guarantees and the adjustment abuses which have resulted. As a substitute, manufacturers have adopted the following standard warranty:

"We do not guarantee pneumatic automobile tires for any specific mileage, but every pneumatic automobile tire bearing our name and serial number is warranted by us to be free from defects in workmanship or material.

"Tires claimed to be defective will be received only when all transportation charges are prepaid, and when accompanied by this company's claim form duly filled out and signed by owner. If, upon examination, it is our judgment that the direct cause of the failure of the tire to render satisfactory service is attributable to faulty material or workmanship, we will, at our option, either repair the tire or replace it for a charge which will compensate for the service rendered by the returned tire, based upon its general appearance and condition.

"Pneumatic automobile tires in which a substitute for air has been used, tires used when not inflated to the pressure recommended by us, used under loads in excess of those recommended by us, used on wheels out of alignment, abused or misused, used on rims other than those bearing these stamps ( ), ( ), ( ), or which have been injured through accident or design, are not subject to claim hereunder.

"This company does not authorize any dealer or agent to make any other or additional Guaranty or Warranty."

This standard manufacturers' warranty would be printed on price lists, tags and stickers accompanying tires much in the same manner as the former guaranty was used. In announcing the change in policy which has been agitating the tire industry for years, the following statement was issued by the Rubber Association of America:

"A movement is well on the way to adoption throughout the tire industry to eliminate the chief evils which have for years caused loss to consumers, dealers and manufacturers through improper claims for adjustment, and manufacturers and dealers are working in harmony to produce the desired result.

"Motorists who take good care of their tires are the strongest contributing factor to future economy in tire costs. Adjustments based on claims other than because

of manufacturing defects strike at the efforts of the industry to secure tire economy. Dealers have been placed in the embarrassing position of losing the good will of tire users and manufacturers have borne the brunt of the loss due to claims which have arisen out of public misconception of the responsibility of tire manufacturers.

"All of the abuses have tended to increase costs and the whole purpose of the present movement is to eliminate the waste due to these causes.

"Under the plan there is a revision of the old guaranty in the form of a new manufacturer's standard warranty, aimed to clear up misunderstandings the public may have had regarding the manufacturer's responsibility. A standard claim form is also being placed in the hands of dealers.

"The manufacturers are taking steps to put the plan into effect immediately. The new manufacturer's standard warranty and the standard claim form have already been welcomed by the National Tire Dealers' Ass'n as a constructive measure. Through the plan all claims covering alleged defects will be presented in a uniform manner for consideration by the tire manufacturer.

"The form should result in the elimination of 'policy' adjustments, which have been the bugbear of the tire industry since its inception and have caused losses running into large sums annually. Hereafter manufacturers will consider alleged defective tires only on the basis of general appearance and the condition in which they are returned by the customer.

"No claims will be considered unless the standard claim form is executed by the tire owner. The claim form does not enter into the transaction between the dealer and the consumer at the time of sale, and is only to be used when the tire owner may have occasion to present a claim based on defective workmanship or material."

## C. A. Blake Appointed Winton Superintendent

CLEVELAND, Nov. 14—C. A. Blake, who for some time has been superintendent of the Stearns factory, has been appointed in a similar capacity at the Winton plant.

N. E. Ranny, purchasing agent for Winton, has resigned. His successor has not been named.

The Winton company is making a rearrangement of factory methods, both in the general office and in factory distribution, for the purpose of cutting down overhead and increasing production, thereby lowering the cost per unit.

## SIGNAL DEMURRER DISMISSED

CLEVELAND, Nov. 14—The Court of Common Pleas has refused to sustain a demurrer filed by the American Signal Co., manufacturer of the Simmons signal, in a patent infringement suit brought by the Protex Signal Co. of this city. The demurrer was for the purpose of finding how strong the court considered the Protex claims of unfair competition.

## British Optimism Maintained at Show

### Olympia and White City Sell Cars —Public Expects Lower Prices

LONDON, Nov. 12 (*By Cable to AUTOMOTIVE INDUSTRIES*)—Business optimism was maintained throughout the annual London passenger car show which closed to-day at Olympia and the White City. There were substantial sales of lighter cars and some of the heavier makes. Reports of large car business are too varied for analysis at this time.

There is a feeling on the part of the public that prices must drop and high body prices are a trade barrier at present. The success of the show has been due pre-eminently to the courage of the dealers. Private sales have been fair and there has been a much larger volume of inquiries than in recent months.

The somewhat improved financial situation and prospects of trade betterment have been the chief factors in this result. Money is tight everywhere and, therefore, it is the part of wisdom to exercise caution in accepting as facts reports now in circulation regarding the actual volume of trade at the show. A majority of the exhibitors professed to be satisfied with the business promised rather than the actual sales. The attendance has been 40 per cent better than last year notwithstanding the fact that the weather was cold throughout the week.

The location of the next show now is being discussed. It is generally accepted that the present plan of dividing the show between two buildings cannot be continued, because it has led to much dissatisfaction on the part of the trade.

## Maxwell Increases Output at Its Newcastle Factory

NEWCASTLE, IND., Nov. 14—F. D. Brebner, superintendent of the local Maxwell plant, states that production is to be speeded up to 150 cars a day. This will be an increase of fifty cars daily over the present schedule and will mean the employment of additional men.

The proposed output will necessitate a considerably larger force than the 900 now employed, the number probably being determined upon Brebner's return from Detroit.

## APPERSON BACK TO 1915

KOKOMO, IND., Nov. 11—Apperson Bros. Automobile Co. is operating five days a week on a schedule about equal to that of 1915 or 1916.

# Move to Drop Distributors Spreads

## Trend Is General Among Companies

### Several to Take Action as Soon as Present Contract Expires

NEW YORK, Nov. 15—While little has been said officially about the movement, which is rapidly gaining momentum among automobile manufacturers, for the elimination of distributors, there is a strong general trend in this direction. Several of the larger companies propose to begin this process of elimination when their contracts with distributors expire.

The Willys-Overland Co. was the first to put the sweeping change into effect by supplanting distributors with factory branches. The various divisions of the General Motors Corp. are reticent on the subject but there is reason to believe that it will be the policy of the corporation as a whole gradually to supplant its distributors. These are only examples to show the trend and numerous other companies propose similar action.

#### Dealers Gain

It is contended that with the distributors, or middlemen, out of the field, it will be possible to make a more liberal discount to the dealer, keep in closer contact with the individual dealers and promote more intensive selling efforts. Manufacturers realize that competition in future will be keener than it ever has been in the past and they are clearing the decks for action.

They contend that they must progress in the race for business or fall back, for they cannot stand still. All of them are determined to give better service for they hold that those companies which take best care of their customers will profit most in the long run. Willys-Overland already has taken a step in this direction by making a material increase in the discount given its dealers on parts.

#### Radical Changes in Lines

Another evidence of the realization that better values must be given purchasers if the race for business is to be successful is found in the extraordinarily large number of new models which are being brought out and which are contemplated for display at the New York and Chicago shows. While it is true that a majority of these models show nothing that is revolutionary, the trend in all of them is towards refinements and improvements which will appeal to the ultimate purchaser and give him better value.

Radical changes have been made in a good many lines, however, and more are

in prospect at show time. As a consequence the prospect who visits the shows next year will find more of interest to him than has been the case for several years. It will be decidedly to his advantage to do considerable "shopping."

In several lines, at least, final price adjustments have not been made and there will be further reductions coincident with the shows. There is nothing to indicate that these additional reductions will be made at the expense of quality and it is quite possible that some of the new lines which differ radically from their predecessors may, increase their prices slightly to cover the added cost of improvements embodied in the cars, but the general trend will be downward.

#### Shows to Stabilize Prices

There is strong hope in every quarter of the industry that the shows will bring a real stabilization of prices. Dealers in all sections of the country contend that the frequent price changes of recent months have added of late to sales resistance and that business cannot be placed on a solid foundation until there is price stabilization for a considerable period. This feeling is not particularly surprising in view of the fact that several companies have reduced their prices after giving positive assurance that the "final reductions" had been made.

There is a growing belief on the part of manufacturers that general inability of distributors and dealers, because of credit difficulties, to stock cars for the winter as heavily as usual will result in a decline in the volume of production for the next four months at least.

(Continued on page 996)

## Willys Denies Rumors Relating to Bugatti

LONDON, Nov. 14 (By Cable to AUTOMOTIVE INDUSTRIES) — Willys-Overland Crossley, Ltd., has acquired the right to manufacture the Bugatti car in Great Britain. The Bugatti is a small Italian car which formerly was made in Germany but now is built in Alsace. It has enjoyed wide popularity on the Continent and has taken part in numerous contests. Fuel economy is one of the arguments advanced in promoting its sale. The car has been sold in England heretofore, but has not been made in this country.

NEW YORK, Nov. 15—It was stated at the headquarters of the Willys-Overland Co., of which Willys-Overland Crossley is a subsidiary, that nothing had been heard here of any contract to manufacture or sell the Bugatti car in England.

## Takes Big Mortgage on G. M. Building

### S. W. Straus & Co. Purchases \$12,000,000 7 Per Cent Serial Bonds

NEW YORK, Nov. 16—Pierre S. du Pont, president of the General Motors Corp., announced to-day that S. W. Straus & Co. had purchased from the General Motors Building Corp., a subsidiary of General Motors Corp., \$12,000,000 first mortgage 7 per cent serial bonds maturing serially from 1922 to 1946.

These bonds are secured by the corporation's new office building at Detroit. This building, which has just been completed, represents an investment of more than \$20,000,000. It occupies an entire block 300 x 500 feet, is 15 stories tall and is the largest office building in the world. This loan represents one of the largest real estate mortgages ever recorded.

In connection with the underwriting, S. W. Straus & Co. said:

"The General Motors building has been leased for a term of 30 years by the General Motors Corp. at an annual rental fixed at an amount sufficient to pay the combined principal and interest charges on the bonds in each successive year, after the payment of all operating expenses. Under the covenants of the trust mortgage the bonds are to be paid off in yearly serial installments, the coupons being payable twice a year, May 1 and Nov. 1.

"The trust mortgage requires the General Motors Building Corp., subsidiary of the General Motors Corp., to make 300 approximately equal monthly payments to S. W. Straus & Co. of \$85,000 each. These payments automatically provide in advance a fund of a little more than \$1,000,000 a year from which the coupons are cashed, the balance being used for the serial retirement of the bonds.

"The bonds constitute a direct closed first mortgage on the building, land and equipment as well as first lien on the income from the property.

"The General Motors Corp. with some of its subsidiary and affiliated companies has already moved into the building and will shortly occupy substantially 50 per cent of the space and whatever remaining space not immediately required for the occupancy of the company is being sub-leased. Construction on the building was commenced in 1919 and the greater portion of it was completed in April 1921. It is now proposed to complete the partitioning, interior finishing and equipment of the remaining portion at an estimated cost of \$3,300,000.

"The General Motors Corp. states that its decision to complete the interior of the remaining portion of the building at this time is based on the fact that there is every indication of an active demand for the space at satisfactory rentals. It is anticipated that the new construction will be completed by May 1, 1922."

## Goodyear Holds Diamond Patents

### Seiberling Denies Rumors That He Has Rights for Tire Tread

AKRON, Nov. 14—With the sale of the Portage Tire & Rubber Co. of Barberton, Ohio, to Frank A. Seiberling finally ratified by Referee in Bankruptcy Harry L. Snyder, and needing only a confirming order from Judge C. D. Westenhaver of the Federal Court of Cleveland to permit consummation of the deal, the former Goodyear president is expected to make formal announcement within the next few days as to definite plans for re-entry into the tire manufacturing business.

#### Portage Sale Probable

Unless attorneys for the Portage stockholders' protective committee file a petition of protest against the sale of the plant to Seiberling, with Judge Westenhaver before Nov. 19, the sale will become automatically confirmed by decision of Referee Snyder. And should the petition be filed it is considered doubtful if Judge Westenhaver will permit any further review of the hearing before Snyder, having already remanded the case to Snyder's bankruptcy court for final decision, following the latter's first confirmation of the sale and the subsequent protest of Portage stockholders.

While these negotiations are going on Seiberling is marking time and anxiously awaiting the time when acquisition of the Portage plant will pave the way for his "come back" as the "Little Napoleon of the tire industry."

With acquisition of the Portage plant Seiberling will be able to enter production at the rate of 5,000 tires and 6,000 tubes daily. The Lehigh Tire & Rubber Co. of New Castle, Pa., which he acquired at receiver's sale, has a capacity of 2000 tires and 400 tubes daily, employing 750. The Portage plant, employing 1500 men, can be built up to a daily capacity of 3000 casings and 2000 tubes.

#### Holds Machinery Patents

Rumors extant in Akron to the effect that Seiberling still held the patent rights on the diamond or famous Goodyear All-Weather tire tread, and had given the Goodyear company a 60-day notice to discontinue the manufacture of that tread, are emphatically denied by Seiberling.

"I did hold the patent rights on the diamond tread but in the reorganization of Goodyear and my own retirement from the presidency of the company, I assigned the patent rights to Goodyear," states Seiberling. "Even if I did now hold them I doubt if I should ever compel Goodyear to quit manufacturing the tread, for my interest lies in promoting Goodyear, not injuring Goodyear, and in helping to continue to protect Goodyear's good name."

Seiberling does, however, hold the patent rights on most of the tire building machinery used by Goodyear and

has given the company shop rights thereto, receiving thereby a royalty on every Goodyear tire made.

Seiberling has development engineers and rubber chemists working upon new tread designs and new tire processes. He announces that he expects to introduce an entire new line of cord and fabric automobile tires and motor truck tires, all of which will constitute a rather radical departure from present tires.

His plans are said to include the organization and financing of a holding corporation, of which he naturally will become the directing head, for the operation of the two rubber companies. That he is still endeavoring to acquire other rubber companies is not denied. The organization of a holding corporation will mean the flotation of a sufficiently large stock issue to permit capitalization and Seiberling announces that when he finally reveals his full plans, the people of Akron and the country in general will have an opportunity to join with him in his new venture.

Seiberling admits that his plans are fully completed and are ready for public announcement as soon as the sale of the Portage company to him is consummated. Portage stockholders, who protested the sale to Seiberling, proposed to refinance and to reorganize the company, buying it in themselves. Seiberling's bid for the Portage plant is admittedly the best offered.

## Selden Business Gained 103 Per Cent in October

ROCHESTER, Nov. 14—Stockholders of the Selden Truck Corp. were informed at their annual meeting that business of the company for October was 103 per cent in excess of September sales. Enough business has been booked for the remainder of the year to assure a healthy increase over 1920.

George C. Gordon was re-elected president of the company. Other officers elected were William C. Barry, Robert H. Salmons, Hal T. Boulden and Wilbur F. Reynolds, vice-presidents; S. P. Gould, secretary and Edwin B. Osborn, treasurer. Charles H. Stearns and Ralph H. Bollard were elected to the directorate, Bollard representing the New York financial interests in the company.

## Halladay Motors Corp. Makes Two New Models

NEWARK, OHIO, Nov. 14—The Halladay Motors Corp., is bringing out two new models, one the Falcon Six and the other the Falcon Light Four. The prices are as follows:

	Six	Light Four
Roadster .....	\$1,595	\$1,295
Touring .....	1,595	1,295
Sedan .....	2,395	2,085
Coupe .....	2,295	1,990
Cabriolet .....	1,795	1,495

The body fittings are brought up to date with the adoption of cylindrical headlamps. The four cylinder model can be fitted with a heavy duty engine with 3½-in. bore instead of 3¼-in. bore at an additional cost of \$200.

## Rail Commission Blames Automobile

### Holds It Responsible for Low Earnings of Pacific Electric of Los Angeles

LOS ANGELES, Nov. 14—The motor car is declared to be chiefly responsible for the low earnings of the Pacific Electric of Los Angeles in a report completed by the engineering division of the State Railroad Commission. This report consisting of two large volumes, was introduced at the hearing of the application of the Pacific Electric to increase rates held here. Had it not been for the financial backing of the Southern Pacific, the parent company, the electric system would probably have gone through a receivership, the report asserts.

#### Travel Increases

Changes in the present rate schedule are called for, if general principles laid down in the engineering survey are approved by the commission, according to the engineering department. As showing the effect of automobile competition, attention is called to the fact that while the traction territory has doubled in population and according to an accepted transportation maxim travel has quadrupled, the electric lines carried fewer passengers in 1920 than in 1914.

The choice whether the railway or the motor bus shall go rests ultimately with the people, the report says, and adds:

"It is the experience, however, not only of California cities, but of practically every community where this choice has had to be made, that the time is not yet here when the street car can be dispensed with and its place taken by the jitney."

On the subject of motor transportation in general the report says:

"It is well known that there is much confusion and great lack of reliability on the subject of motor transportation costs. Our study appears to confirm the opinion held by us heretofore, that under normal conditions and in a great majority of cases, the jitney or motor bus cannot compete with the electric lines and that the real costs of motor transportation are higher than commonly figured and higher than the costs of electric transportation. This in the face of the fact that electric transportation has to sustain a heavy investment in permanent way, while the motor service carries no such burden."

#### INTERLOCKING REORGANIZED

AKRON, Nov. 14—The Interlocking Cord Tire Co., of which the receivership was lifted recently, has been reorganized by stockholders with Edward Kohl as president and has resumed tire production in its Mogadore plant near Akron. Production for the present will be 50 tires daily. The company went into the hands of a receiver with indictment of its former officers for alleged violation of the Ohio blue sky law.

## Spring Shortage of Cars Foreseen

### Many Dealers Are Unable to Finance Stocks for Winter Months

NEW YORK, Nov. 15—Slackening of production, which had been expected in the passenger car field this month, already has become apparent, especially in the medium priced lines. The falling off includes such companies as Ford, Dodge, Buick and Studebaker. While the Ford November schedule calls for 85,000 cars it is flexible and production will be continued on the basis of sales.

While these companies, which have been running at top speed for many weeks, are slowing up, other manufacturers who have not done so well are now benefiting from new models and new prices. Maxwell is conspicuous in this list and its new models have brought many congratulatory comments. Advance reports of the new Chalmers line indicate that it will be on a par with its companion car and that the two together will do much to rehabilitate the Maxwell-Chalmers combination.

Numerous other companies have brought out new models embodying many improvements or contemplate doing so in the near future. As a consequence, with the price concessions which have been made in the past year, purchasers of cars hereafter will get better value for their money than they have for a long time.

There is much interest and speculation both inside the trade and out over the air-cooled line with which the General Motors Corp. is experimenting. There have been many unauthorized and inaccurate reports regarding General Motors plans in this connection. They have been set at rest by the official statement by President duPont that plans for manufacture and sale of these models must be held in abeyance until the experimental development work is finally completed. The cars are being developed under the direction of C. F. Kettering, who has charge of the corporation's engineering work, and it is not proposed to put them on the market until they are satisfactory to their sponsors in every respect.

Much interest has been aroused by the affidavit of M. B. Leahy, general sales manager of the Durant Motor Co. of New York, which stated that a total of 24,817 shipping orders had been received at the close of business Oct. 22. If this pace is maintained Durant will be one of the biggest pro-

ducers in 1922. Deliveries of the "Four" have begun and production will increase steadily. No date has been set for putting the six-cylinder Durant on the market.

Manufacturers' schedules are being curtailed to a greater extent than otherwise would be the case because of their determination to build only for actual sales and dealers generally are not inclined to stock cars heavily for the winter months. This is not due to any skepticism on the part of the dealers as to the future of business but rather to difficult credit conditions. Many dealers, especially in the smaller towns, have found it impossible to finance stocks of cars to carry them over the winter. It is feared that this condition may result in a temporary shortage in cars in some popular lines in the early spring.

## Tire Shipments Show Decline in September

WASHINGTON, Nov. 14—Analysis of business conditions by the Department of Commerce based upon reports of trade associations and other co-operating bodies, shows that domestic shipments of tires and tubes indicated a seasonal decline of from 25 to 30 per cent during September. Stocks of pneumatic tires declined 14.5 per cent and solid tires 25.7 per cent, while inner tube stocks showed an increase of 4.5 per cent. Stocks of each of these products are from 30 to 45 per cent less than the average of the six months, November, 1920, to April, 1921. Production, on the other hand, is from 60 to 200 per cent above the same six months average.

Imports of crude rubber increased 4.4 per cent in September and were 23.9 per cent greater than for the same month of 1920. Consumption of crude rubber by tire manufacturers made the seasonal decline amount to 36.5 per cent in September with tire and tube production dropping correspondingly.

## Three American Firms to Exhibit at Brussels

PARIS, Nov. 6 (*By Mail*)—The Belgian automobile show, the last of the European series, will open in the Palais du Cinquantenaire, Brussels, on Dec. 3 and will close on Dec. 14. The exhibition is international and is open to the entire automotive industry, there being sections open for passenger cars, trucks, motorcycles, tractors, accessories, and bodies.

In the passenger car section France has a majority with 31 exhibitors. Italy is represented by five firms; America will have Studebaker, Case and Overland; England is sending two makes of cars, and the Belgian passenger car makers in the show are Metallurgique, Minerva, Dasse, Imperia-Abadal, Excelsior, F. N., Nagant, Miesse, and Somea. There are 208 exhibitors.

## Dealers Organize in Pennsylvania

### Association Idea Emphasized at Meeting Which Unites 689 Men in Industry

HARRISBURG, PA., Nov. 15—The Pennsylvania Automotive Association was organized here yesterday and to-day with 200 members. It is affiliated with the National Automobile Dealers Association and will include in its membership car and truck distributors and dealers, jobbers, automotive equipment dealers, repairmen and various other classes of people in the automotive trades who will be classed as associate members.

The association was formed with the two-fold purpose of employing co-operation to alleviate trade troubles and mobilizing favorable public opinion for the good of the industry.

The meeting was held in the chamber of the House of Representatives at the State Capitol and was attended by 156 representative men in the trade, mostly dealers, who spoke for local associations in 60 cities and towns, representing 689 members.

### N. A. D. A. in Charge

Details of the organization were conducted by Harry G. Mooock, general manager, and P. F. Drury, assistant general manager of the N. A. D. A.

There was no thought expressed that the association would be able to solve the used car problem, or make dealers' relations with manufacturers 100 per cent satisfactory.

The meeting itself developed a valuable exchange of ideas through addresses and an open forum. Speakers included Mooock, Drury, Wayne Hearne, who is doing educational work in dealer organization throughout the country, Alfred Reeves, general manager of the National Automobile Chamber of Commerce, Harry Meixell, Jr., secretary of the Motor Vehicle Conference Committee, Neal G. Adair, editor of *Motor World*, and A. V. Cummings of the *Automobile Trade Journal*.

### Wayne Hearne Speaks

Hearne declared that the 1922 dealer will have a keen appreciation of honor, will tend toward becoming an exclusive dealer instead of handling various lines, "because exclusiveness makes for expertness," will control his prospects and assign them to salesmen best fitted to handle them, instead of letting them remain the "property" of individual salesmen, will "quit worrying about a contract and sell merchandise that he has faith in as long as he likes the factory policy and the factory likes his representation."

Of the manufacturers, Hearne said: "You say the factories compel you to trade. Can you call yourselves business men when you let someone else run your business? You ought to run it yourselves or get out."

## Hawkins Outlines Service Methods

### Inefficiency in Selling Plans Are Also Discussed at Mana- gers' Convention

NEW YORK, Nov. 17—Adoption of an efficient and satisfactory service policy as a means of increasing sales was advocated by N. A. Hawkins of the advisory staff of the General Motors Corp. in an address before the Service Managers' Convention at the National Automobile Chamber of Commerce.

Hawkins referred to the car owner as the service manager's "boss," and declared that unless the service department functioned to the satisfaction of that "boss" the department was a failure.

#### Parts Stocking Necessary

A good many things enter into the matter of efficient service, it was pointed out, and the speaker went on to describe methods of meeting some of the obstacles encountered. One important point discussed was the matter of dealers not carrying a complete stock of car parts.

Hawkins advocated the stocking of dealers' shops with sufficient parts so that there would be an elimination of telegraphic orders, parcel post and express deliveries. All these items, of course, must ultimately be borne by the purchaser of the part, and unless the dealer is adequately stocked the cost is materially increased. In this connection it was also shown that by the manufacturer keeping his dealers stocked with parts from the factory, the so-called "pirate parts" would be largely eliminated.

Hawkins declared that the job of keeping old cars running is more important than selling new cars, for the car owner who is satisfied with the service he receives on an old car will, when the time for replacement comes, place an order for a new car of the same make as his old one.

#### Would Zone Cities

Somewhat aside from the question of service, Hawkins touched upon the inefficient selling methods in use in many cities, and offered as a remedy the zoning of cities according to population and territory. It was shown that it was possible in New York to-day to have 40 salesmen selling the same car call on a single prospect the same day. This, he said, was due to the fact that salesmen representing different dealer organizations were not confined to any one district, but were given free play throughout the entire city.

The discussions that followed Hawkins' address centered about several topics, one of the most talked of being the "pirate part" evil. Several service managers were of the opinion that all parts that were not easily distinguishable should be trade-marked. The fact

## FIRST DURANT SIX DRIVEN TO MUNCIE

NEW YORK, Nov. 15—W. R. Willett, president and general manager of the Durant Motor Car Co. of Indiana, will start from this city for Muncie to-morrow in the first Durant six to be turned out and tested at the Long Island City plant of the Durant Motor Car Co. of New York.

Experimental work on the Durant six, which will be scarcely recognizable as the former Sheridan of the General Motors line, has been practically completed and production will begin in the near future at Muncie.

Deliveries of the Durant four to purchasers have been begun from the Long Island City plant.

was brought out that manufacturers buying a certain part might reject material that was submitted to them for the construction of that part.

The parts manufacturer, in turn, would go ahead and construct the articles of that rejected material and sell directly to the dealer upon the representation that the part was the same make as that used in the original car. Naturally, the part could be bought considerably cheaper than it could from the manufacturer. Placing of trade-marks upon such parts, it was pointed out, would eliminate this evil. It was also agreed, in this connection, that there are many parts which can best be serviced by the parts manufacturers, and that there should be little attempt by the dealer to undertake such work.

Parts prices were also thoroughly discussed and most of the delegates were of the opinion that there should be a reduction in those prices, especially since there has been a reduction in car prices. How this should be accomplished, however, was left largely to the individual manufacturer to determine.

There was also a discussion as to whether the list price of each part should be made to include the tax and transportation charges, so that each part could be purchased for the same amount of money throughout the country. Generally, it was agreed that parts prices should be listed f.o.b., although there were strong arguments for the other method.

#### A. E. VINTON DIES SUDDENLY

INDIANAPOLIS, Nov. 11—A. E. Vinton, assistant general sales manager of the National Motor Vehicle Corp., died suddenly at his home here although he had been in apparently normal health. Vinton first joined the National organization in 1909 and served continuously with it until 1917, when he became associated with the Mansfield Tire & Rubber Co. He returned to the National as assistant general sales manager in August of this year.

## Tire Production Less in September

### Decline of 600,000 in Stocks on Hand—Pneumatic Ship- ments Decreased

NEW YORK, Nov. 15—A reduction of approximately 1,100,000 in the number of pneumatic tires produced in September as compared with August was reported to the Department of Commerce by the Rubber Association of America in its statistics on production, shipments and inventory. There was a decline of about 600,000 in stocks on hand, but a falling off of 840,000 in shipments of pneumatics. The figures by months since November, 1920, which was taken as the base month, up to October follow:

#### PNEUMATIC CASINGS

1920	Inventory	Production	Shipments
Nov. ....	5,170,928	915,651	1,262,159
Dec. ....	5,508,380	506,111	1,327,153
1921

Aug. ....	216,367	55,694	66,866
Sept. ....	161,832	37,441	50,276

"Production" and "Shipments" figures cover the entire month for which each report is made. "Inventory" is reported as of the last day of each month.

"Inventory" includes tires and tubes constituting domestic stock in factory and in transit to, or at, warehouses, branches (if any), or in possession of dealers on consignment basis, and as a total represents all tires and tubes still owned by manufacturers as a domestic stock.

"Shipments" include only stock forwarded to a purchaser and does not include stock forwarded to a warehouse, branch, or on a consignment basis, or abroad.

#### SPOKE COMPANY SOLD

PINE BLUFF, ARK., Nov. 15—The Pine Bluff Spoke Co. has been sold by C. A. Dunning and associates to Peers & McGlone of Shreveport, La., who will operate the plant on an increased capacity. Last year in nine months the factory turned out more than \$500,000 worth of spokes for automobiles. Buick, Dort and Oakland were among the makes of automobiles supplied.

## S.A.E. and Petroleum Institute Cooperate

### Former Will Furnish Several Speakers for Annual Meeting of Latter

NEW YORK, Nov. 15—The second annual meeting of the American Petroleum Institute, to be held at the Congress Hotel, Chicago, Dec. 6, 7 and 8, 1921, will include two sessions in which members of the Society of Automotive Engineers and other men prominent in the automotive industry will take a conspicuous part.

The most important sessions from the automotive standpoint are those to be held on the mornings of Tuesday, Dec. 6, and Wednesday, Dec. 7, and the evening of the latter date. The speakers at the morning sessions referred to will include the following:

#### To Discuss Fuel Problems

Quantitative Survey of Petroleum Industry in Respect to Motor Fuel Production by Dr. Van. H. Manning of the A. P. I.; Quantitative Survey of Automotive Engine Fuel Requirements by a representative of the National Automobile Chamber of Commerce; Qualitative Requirements of Motor Vehicle Fuel by Henry M. Crane, representing the S. A. E.; Qualitative Limitations in Marketing and Refining by Frank A. Howard of the Standard Oil Co. of N. J.; Volatility of Motor Fuel as Marketed in the United States by N. A. C. Smith of the U. S. Bureau of Mines; What Constitutes True Volatility, by R. E. Wilson of the Massachusetts Institute of Technology; Limitations Imposed on Economy by Volatility Changes by F. C. Mock and Practical Effects of Too Low Volatility by O. C. Berry. David Beecroft, as President of the S. A. E., will speak briefly on the general subject of research.

At the evening session on Wednesday, Dec. 7, Harry L. Horning will make an address in which he will discuss some of the fuel problems of the automotive industry.

One purpose of the foregoing sessions is to promote a better mutual understanding in relation to fuel problems which concern the fuel producers on the one hand and the producers of equipment which uses the fuel on the other.

#### Sessions Open to Public

Other sessions, the subjects of which have not as yet been announced, will be held in the afternoon and evening of the first two days of the meeting and the morning and afternoon of the concluding day. The speakers at these sessions will include the following, most of whom are prominent officers of various companies in the petroleum or closely related industries:

Walter C. Teagle, Thomas A. O'Donnell, Amos L. Beaty, D. W. Moffitt, Edward L. Doheny, Edward Prizer, Frank Haskell, J. D. Collett, Paul Shoup, Louis C. Sands and Edward C. Finney, first assistant secretary, Department of the Interior.

The concluding event of the meeting will be the dinner to be held on the

## INTERESTING SCHOOLS IN SAFETY CAMPAIGN

WASHINGTON, Nov. 15—Posters are being distributed by the Highway and Highway Transport Education Committee announcing prizes to be awarded grammar school children for the best essay on "How Can I Make the Highways More Safe" and the rewards to grammar school children for the best classroom lesson for their grades which teach children safe behavior on the highways.

The contest is endorsed by the United States Bureau of Education for the purpose of conserving and developing useful material for safety education. The prizes are donated by the National Automobile Chamber of Commerce.

The posters also announce the rules of the contest and the books on safety which the committee recommends to contestants.

evening of Dec. 8. The speakers at this dinner will include Robert W. Stewart, Harry F. Sinclair, J. C. Donnell, Henry L. Doherty, A. C. Bedford and Sir John Cadman of London, formerly His Majesty's petroleum executive.

All sessions are open to the public.

## Department of Commerce Issues Output Figures

NEW YORK, Nov. 14—Publication of production figures for the automobile industry, covering both passenger cars and trucks has been begun by the Department of Commerce. The National Automobile Chamber of Commerce supplies the figures for its members and the Department of Commerce obtains the statistics from manufacturers who are not members of the N. A. C. C. The report for the quarter ended Sept. 30 shows a production of 474,188 passenger cars and 37,322 trucks or a total of 511,510.

The figures for the three months follow:

	Passenger Cars	Trucks
July .....	163,998	10,801
August .....	166,393	13,076
September .....	143,797	13,645
Total .....	474,188	37,322

The showing for the third quarter of this year, in comparison with the same period of 1920, is amazing. Production in July, August and September of last year with figures from non-members of the N. A. C. C. missing was approximately 560,000, or only about 50,000 less than this year.

#### CHARLES R. LAMBERT DIES

DETROIT, Nov. 12—Charles R. Lambert, president of Clayton & Lambert Mfg. Co., manufacturer of pressed metals and gasoline tools, died this week after an illness of several years.

## Action on Maibohm Awaiting Creditors

### Postponement of Reorganization Also Due to Federal Tax Claim

SANDUSKY, OHIO, Nov. 15—The sale of the Maibohm Motors Co., for the purpose of reorganization of the company, has been postponed until Nov. 28 in order to determine priority of a claim for Federal taxes and allow other creditors to align themselves in the matter of the reorganization.

It is asserted by officers of the company that approximately 90 per cent of the claims are now represented by the creditors' committee, which has worked out the plan for reorganization. The plan contemplates the issuance of about \$600,000 of 7 per cent non-cumulative preferred stock to be issued to creditors to the amount of their claims. This stock would have full voting power and elect its own board of directors, thus having full control of the company until it is retired.

Heading the committee of creditors is E. G. Kirby, trust officer of the Commerce Guardian Trust & Savings Bank, Toledo, and serving with him are R. E. Hayslett of the Hydraulic Pressed Steel Co., Cleveland, and N. T. Brotherton of the Brotherton Knoble Advertising Co., Detroit. W. J. Corr, secretary of the company, has been appointed receiver and trustee in bankruptcy by Federal Judge John M. Killits.

The complete reorganization of the sales department of the company is contemplated following the corporate reorganization. Chairman Kirby of the creditors' committee declared that the plant is expected to turn out between 600 and 1000 cars for the year 1921. He said production of 400 cars would enable the company to take care of its overhead expenses and preferred dividends.

The capitalization of the new company has not yet been determined. It will, however, go into business with nearly \$800,000 of assets and no liabilities.

#### MOVING WILLYS FOUNDRY

TOLEDO, Nov. 15—The aluminum foundry of the Willys-Overland Co. is being moved to Pontiac, Mich., where it will be housed by the Wilson Foundry & Machine Co., an allied plant. By moving the plant, all related foundry operations will be brought together and considerable space will be saved at the main plant here.

#### DURANT PARTS FOR CANADA

TORONTO, Nov. 14—W. C. Durant stated here recently that his contracts with the parts makers call for the establishment of Canadian plants for the making of parts for the Canadian Durant 4 and 6 models. In the connection Continental and Auto-Lite were mentioned.

## Tire Prices Drop to Lowest Levels

**Goodyear, Miller and General  
Reductions Range from 10  
to 30 Per Cent**

AKRON, Nov. 14—Automobile tire prices have gone to the lowest level in the history of the tire industry, with announcement of drastic price reductions, effective Nov. 15, by most of the major tire companies of Akron.

The long expected break in tire prices came Nov. 12 and followed leads taken by the Firestone Tire & Rubber Co. of Akron and Mason Tire & Rubber Co. of Kent, both of which made price revisions Nov. 1. Firestone cut 20 per cent on cord tires, 10 per cent on fabrics and 10 per cent on truck tires. Mason made a blanket cut of 15 per cent.

Goodyear, Miller and General simultaneously announced their new price schedules Saturday. No announcement at the time was forthcoming from the Goodrich company. The cuts range from 10 to 30 per cent.

### Below Pre-War Level

The significance of the new price schedules is the fact that they bring tire prices to below their pre-war levels by nearly 15 per cent. Another outstanding feature is the fact that the larger cuts are made in prices of cord tires, thus cutting almost in two the margin of price difference between cord and fabric tires, and making it possible to buy cord tires within 25 or 30 per cent as cheaply as fabrics.

The Goodyear cuts announced are 30 per cent on the 3½-in. and 4-in. straight-side cord tires, 26 per cent on the 3½-in. clincher cord tires, and 20 per cent on all 4½ and 5-in. cord tires. Cuts on fabric prices range from 10 to 20 per cent. Goodyear makes no announcement of truck tire revisions.

The Miller Rubber Co. cuts cord tire prices from 20 to 30 per cent and makes a 10 per cent cut on fabrics and a cut ranging from 10 to 20 per cent on truck tires. General price cuts are 20 per cent on cords, from 10 to 20 per cent on fabrics, and 10 per cent on truck tires.

### Smaller Size Cut Greatest

"The fact that tires can now be marketed at less than pre-war costs while at the same time the quality of the product has been greatly improved," says the Goodyear statement made in connection with the company's price revisions, "shows that the rubber industry has done its bit toward bringing back normal stabilized business conditions. The result has been obtained by taking advantage of the present abnormally low costs of raw materials and by increased efficiency of manufacture and distribution, and rigid economies of operation.

"Automobile owners will be interested to know that we have been able to bring down the price of the popular cord tires to where they are not much more expensive in first cost than fabric tires. The differential between the two types in fact has been cut

practically in two. The largest reductions have been made in the smaller sizes where the larger volume of use permits the greatest reduction in manufacturing and distributing costs.

"We believe that business is going to right itself and drive ahead just as soon as the cost of living is adjusted to the income of the consuming public, and the rubber industry is not going to be the last to forward that return to normal."

### Goodrich at Low Mark

AKRON, Nov. 15—The B. F. Goodrich Co. has announced drastic tire price reductions effective to-day. The reductions are on practically all sizes of fabrics and cord automobile tires, solid and pneumatic truck tires and inner tubes.

On the popular sized cord tires the price cuts average over 22 per cent. The Goodrich schedules make the following reductions:

Sizes	Old Price	New Price
30 x 3½ cords.....	\$24.50	\$18.00
32 x 3½ .....	32.90	25.50
31 x 4 .....	40.70	29.40
32 x 4 .....	41.85	32.40

The percentages of cuts taper down according to the larger size tires, being from \$65.10 to \$57.60 on the 37 x 5 and from \$61.90 to \$54.75 on the 35 x 5. Fabric cuts are smaller comparatively, the larger cuts being made in cord prices to bring cord tires nearer the fabric tire costs, Goodrich officials say.

As Goodrich led the field with a 20 per cent cut last May, the new cut carries Goodrich prices to their lowest level, based on mileage records.

(Continued on page 997)

## Fusion Is Under Way of Benz and Rumpler

PARIS, Nov. 6 (By Mail)—Negotiations are in hand for a fusion of the two German firms Benz and Rumpler. The Benz company is the biggest exclusively automobile concern in Germany, with passenger car, truck and Diesel engine factories at Mannheim. It employs about 10,000 hands at the present time.

The Rumpler concern was one of the biggest producers of airplanes in Germany during the war, with factories in the suburbs of Berlin and at Augsburg, in Bavaria. This year, Rumpler, who was an automobile engineer before taking up aviation, produced an automobile of revolutionary design which he intended to build in his Berlin factory and also to have built in other factories under license. Benz never has built airplanes, but was prominent in aviation engines during the war.

### EARL ADDS UNIT

DETROIT, Nov. 14—Earl Motors Co., Inc., has taken over the Jackson Metal Products Co. and the plant will be operated in the future as an Earl manufacturing unit. Most of the sheet metal work for the bodies gasoline tanks, radiator shells and enameling work will be done in the new plant. With the addition of this work the Earl car will be about 80 per cent constructed in the Earl factories.

## A. E. A. Continues Its Sales Program

**Motion Pictures at Annual Con-  
vention Visualize Work of  
New Department**

CHICAGO, Nov. 15—The Automotive Equipment Association, in annual convention here this week, recommitted itself to the sales promotion program authorized at the Mackinac Island convention in July. The work of the campaign to date and plans for the future were visualized for 500 manufacturers and jobber members and their sales representatives in an address by Ray W. Sherman, merchandising director, and in a motion picture presentation of the means by which the association is trying to educate the retail trade to "ask 'em to buy" and so broaden the outlet for the products of the industry.

The story of the sales promotion work made a decidedly favorable impression upon both manufacturer and jobber members. It won for the merchandising department assurances of the working support of members which is necessary in the undertaking of organizing the industry itself to carry out the details of the campaign.

### No Large Field Staff

The association has discarded all suggestions for a large field staff or for extensive appeals to the trade by mail in favor of education of the retail trade through the agency of the jobber salesman, with the manufacturer salesman assisting wherever circumstances permit.

The motion picture showed how a typical salesman demonstrated the profit possibilities in automotive equipment merchandising to a typical garageman and converted the garageman to the better merchandising idea. The movie will be used throughout the country, particularly during the automobile show season and at trade association meetings, to further the campaign.

The business exhibit held in connection with the convention profited somewhat in sales by manufacturers to jobbers through the stimulation resulting from presentation of the sales promotion idea. On the whole, however, jobbers bought lightly. The price reduction trend in the equipment field and the ambition of the jobbing houses for quick turnover were responsible.

Howard M. Dine of Dine Dewees Co., Canton, Ohio, jobber, was nominated for president and C. C. Gates of the Gates Rubber Co. of Denver, vice-president.

### BENZ PLANT CLOSED

NEW YORK, Nov. 15—A dispatch from Frankfort on the Main states that the large automobile works of Benz & Co. at Mannheim have been closed because of "terroristic excesses" of the workmen who are stated to have forced their way into the directors' room and threatened the directors and engineers with physical violence.

## Report of Packard Shows Operating Loss

### Reduced Assets of Company Reflect Reduction in Inventories During Year

DETROIT, Nov. 15—Packard Motor Car Co.'s annual report read at the stockholders' meeting showed an operating loss for the year of \$987,366. Of this \$389,347 was chargeable to the factory and \$598,018 to branches. After paying dividends on preferred stock and setting aside reserves for contingencies, the surplus showed a reduction of \$4,833,776. The surplus now totals \$15,923,895. The balance sheet showed cash and readily marketable securities of \$10,323,000 and current liabilities of \$3,807,342.39.

Directors of the company were all re-named at the annual stockholders meeting and the officers were re-elected by the directors.

### Outlook Optimistic

President Alvan Macauley in his annual statement said:

"We have passed through the trying year in excellent financial condition as the balance sheet indicates. Our various products are fully developed and perfected; our distributors have held together remarkably well, and we are in a position to manufacture and sell, we believe, on a basis competitive with the best among modern manufacturers. With the organization in all its branches working splendidly together, and with a unanimous support and cooperation on the part of the directors of this company, the management looks forward to the future with great confidence.

"After setting up as liabilities amounts owing for current purchase and pay rolls, and reserves for unmatrued indebtedness including interest on bonds, and taking into account \$9,853,500 of outstanding debenture bonds and a reserve of \$2,500,000 for contingencies, the company's net worth is \$42,598,795.93. After deducting from the company's net worth the preferred stock at par, the common stock is shown to have a book value of \$23.39 a share."

### Assets \$58,759,638

Total assets of the company of \$58,759,638.32, compared with \$62,808,276.76 a year ago, reflect the reduction in inventories during the year as do the current assets of \$36,167,538.57, compared with \$40,116,589.53 on Aug. 31, 1920. Current liabilities of \$3,807,342.39 also show a reduction as against \$12,442,004.57, part of the latter amount having been refunded in the \$10,000,000 of 10-year 8 per cent gold bonds, dated April 15, 1921, of which \$9,853,500 was outstanding at the end of the fiscal year.

Besides inventories, amounting to \$13,714,703.61 at the Detroit factory and \$7,515,741.84 at the branches, current assets include \$4,523,715.75 in cash, against \$4,314,809.89 a year ago, \$5,800,000 in U. S. Certificates of indebtedness and \$178,123.56 in marketable securities, against miscellaneous investments of \$207,535.43 a year ago, accounts receivable \$3,290,993.71 compared with \$4,882,-

189.47 and deferred installment notes and bills receivable \$1,144,260.10 against \$1,352,727.66.

Current liabilities consist of \$2,188,269.72 in accounts payable and pay roll and \$1,619,072.67 accrued interest and liabilities not due. In the previous year current liabilities included \$5,000,000 of bank loans, \$4,087,549.40 in accounts payable and payrolls and \$3,354,455.17 in Federal taxes and miscellaneous liabilities not due.

Touching on economies effected during the year, President Macauley's report says the company was able to reduce productive labor and manufacturing expense 68 per cent from the amount expended for these two items the previous year. The sales outlook for the coming year he describes as encouraging the anticipations of a profitable and increasing business.

## Agent Obtains Damages in Suit Against Hassler

COLUMBIA, S. C., Nov. 14—David C. Shaw of this city was awarded \$15,000 damages in the United States District Court here in a suit brought against Robert H. Hassler, Inc., of Indianapolis. Shaw sued for \$175,000.

The action grew out of an alleged breach of contract regarding the agency for automobile shock absorbers, manufactured by the Hassler company, and covering exclusive distributing rights in the State for a period of not less than five years. Under this contract, Shaw said he accepted and sold one car load of shock absorbers, building up at the same time, a sales force throughout the State. A second car load of shock absorbers arrived, Shaw testified, and he was notified that he was no longer State agent, and the Columbia Compress Co. instructed not to deliver the car to Shaw, refused to turn it over to him.

The defendant concern claimed the right to terminate the contract and also set up the plea that Shaw, by his alleged failure to pay for the car, had in effect canceled the contract.

This is the second time that the suit has been tried, the first hearing having resulted in a mistrial.

## Dealers Purchase Little at Government Auction

ATLANTA, Nov. 14—Automobiles and motor trucks of an original value of perhaps \$200,000 were sold at public auction at Camp Jesup, near Atlanta, all sales being made to the highest bidders regardless of the price. Most of the equipment was reported to be in comparatively poor condition because of the ravages of weather, but considerable of it was still in working order and was sold at ridiculously low prices. Buyers were present from all over the southeast, including a number of dealers, but only a comparatively few sales were made to dealers. The sale included 116 White motor trucks, several Packard trucks and a number of touring cars.

## Gunn Designs Car for Colonial Motors

### New Company Enters Medium Priced Field in Canada—Production in 1922

DETROIT, Nov. 17—Colonial Motors, Ltd., has been incorporated at Windsor, Ont., with a capital of \$1,000,000 for the manufacture of a specialized unit car to be known as the Canadian, which will sell in the medium price field.

The former plant of the Detroit Insulator Co. at Walkerville has been purchased and production will be started soon after Jan. 1. The output for 1922 is expected to range from 2000 to 3000.

The car will be made in the usual body styles and has been designed by Earl G. Gunn, who was formerly a designer with the Premier and Packard among other companies. The car follows conventional lines except for the elimination of a front axle for which a transverse spring construction is substituted. The engine will be six cylinder type. Body and chassis construction are designed primarily to meet Canadian road conditions. Cars built for export trade will follow special designs to meet conditions in the countries to which they are shipped.

George L. McCain is assistant engineer of the company. Officers have not been elected, pending final development of plans. William Lorimer of Windsor, Ont., and L. A. McCalla are representing the prospective directors in the completion of manufacturing plans.

## Allied Motor Commerce Plans Transport School

INDIANAPOLIS, Nov. 8—The ways and means committee of the recently organized Allied Motor Commerce, Inc., has decided to found a national motor transport school at Indianapolis for the training of executives for motor transport organizations and also plans to establish an extensive data collection and information bureau on all phases of motor transport, availing itself for this purpose of the new motor transport terminal soon to be erected by the Indiana Highway Transport and Terminal Association.

The bureau will also concern itself with highway questions and promotions and make it part of its work to show the public that advancement along this line for truck use interests every taxpayer as well as the transport men and companies directly affected by the roads.

The chairman of the committee is Joseph P. Hayes of the Heating and Plumbing Contractors Association.

### CURTISS ENLARGES FIELD

MONMOUTH, ILL., Nov. 14—The Curtiss-Iowa Aircraft Corp. has been authorized to do business in Illinois and of its \$250,000 capital stock \$36,850 is to be devoted to business in Illinois.

## Lincoln Inventory Halts Production

### Issuance of Receiver's Certificate Probably Not Necessary to Continue Business

DETROIT, Nov. 16—Inventories are still in progress at the plant of the Lincoln Motor Co. and probably will not be finished before the end of the week. Until this task is completed no more cars will be built and no operating schedules will be determined upon. Sales demand will be met from the reserve of cars on hand when the receiver took charge.

H. L. Stanton, vice-president of the Detroit Trust Co., has taken over the active executive work of directing the company. He is being assisted by President H. M. Leland and Vice-President W. C. Leland, acting in advisory capacities. Stanton is the corporation officer of the trust company and has acted as receiver in several reorganizations of automotive companies. He thinks it unlikely that the services of an automobile executive will be sought.

#### Creditors Co-operating

The receiver has not determined how much money will be available to continue the business, but President Ralph Stone of the Detroit Trust Co. thinks it likely there will be enough without the issuance of receivers' certificates. In this connection he declares that the creditors are co-operating to the fullest extent in helping place Lincoln on a sound business footing.

Completion of cars now in process will give the company an additional margin to work upon and a fair number of sales are expected in November, although not the 200 hoped for at the beginning of the month. Orders are reported coming in steadily, distributors finding the demand well up to seasonal standards and in some districts exceeding it.

The receiver states that sales policies of the Lincoln company will be continued, at least for the present. This will mean operating on a sales basis with the possibility of a sales campaign being launched later. A telegram was sent to all distributors to-day by the receiver promising active co-operation at the earliest possible moment and declaring the company was prepared to fill all orders for cars as well as to meet all service demands.

#### Company Ready to Resume

A definite statement of assets and liabilities is now being prepared. Until it is available definite plans cannot be announced for the operation of the plant. Only minor changes have been made in the organization. The office force is being reduced but otherwise the company is staffed to resume operations. Creditors are being asked to forward statements of their accounts for comparison with the company's records.

Through an error, it was stated in AUTOMOTIVE INDUSTRIES last week that

the Lincoln company has filed a voluntary petition in bankruptcy. The court action involved only the appointment of a receiver upon petition of a creditor asking for a receivership for the protection of assets and continuance of the business pending reorganization.

No announcement has been made concerning reorganization plans but it is understood the Lelands lost control of the company when mortgage bonds were issued last July.

NEW YORK, Nov. 16—Formation of a stockholders' protective committee for holders of the Class "A" issue of stock of the Lincoln Motor Co. is announced here. Frank W. Blair & Co. was appointed chairman and the other members chosen were Robert K. Cassatt, Joseph A. Bauer, George S. Franklin, George F. Fuller and G. Herman Kinnicutt.

The committee requested holders of the issue to deposit at once stock certificates with the Central Trust Co. of New York, the Union Trust Co. of Detroit, or the Commercial Trust Co. of Philadelphia. Temporary receipts will be issued by the depositaries in exchange for the stock certificates deposited.

The Class "A" stock, \$50 par, comprises most of the outstanding issues, totaling \$8,000,000, while the Class "B," of no par value, has 160,000 shares outstanding.

## War Supplies Reimported Pending Senate Action

WASHINGTON, Nov. 16—Every effort is being made to expedite the passage of the so-called Graham resolution which would impose a tax of 90 per cent on automobiles, trucks and other war supplies reimported to this country. The bill is on the Senate calendar and will be considered after the conference report on internal revenue revision is adopted.

The bill as passed by the House was favorably reported by the Senate Finance Committee in August, but on objection of one or two senators it was not adopted at that time.

Reports have been received this week, however, showing that quantities of surplus war material have been shipped to this country, as importers or distributing agencies here are taking advantage of the legislative delay.

## Auto Body Co. to Start Durant Body Work Dec. 1

LANSING, Nov. 16—The Auto Body Co. has doubled its working force and will gradually increase the number throughout the winter as the new models of Durant and Earl cars get into production.

A regular schedule on Durant bodies will start Dec. 1. Production already has begun on the Earl touring bodies, and the present schedule will be maintained throughout November and December, when it will be increased.

## Truck Tax Basis Is Same As Candy

### Old Scale Retained in Conferees' Agreement on New Revenue Bill

WASHINGTON, Nov. 16—The Senate and House conferees on the tax revision bill have agreed on the manufacturers' excise tax which shall apply to motor vehicles and automotive equipment. No change has been made in the old scale, which is as follows:

Automobile trucks and automobile wagons, including parts and accessories, 3 per cent.

Other automobiles and motorcycles, including parts and accessories, 5 per cent.

Tires, inner tubes, parts or accessories for motor vehicles sold to any person other than a manufacturer or producer of motor vehicles, 5 per cent.

In addition to motor vehicles, this stigma taxation will apply, under the agreement of the conferees, only to yachts and motor boats costing more than \$100, cameras, candy, firearms, hunting and bowie knives, daggers, sword canes, metallic knuckles, cigar and cigarette holders, automatic slot device vending machines, servants' liveries, hunting and shooting garments, works of art and a few other luxuries which cost more than a stated amount.

An agreement has been reached for a repeal of the taxes which had been in force on furs, musical instruments, sporting goods, moving picture films, chewing gum and electric fans.

As a result of the decision of the conferees, motor trucks which are expected to save the country from disaster in the event of a railroad strike, are taxed on the same basis as candy. Passenger cars, which President Harding has stated are an indispensable part of the life of the country, are taxed on the same basis as works of art and automatic vending machines.

## To Offer Cotta for Sale Dec. 15 as Going Concern

ROCKFORD, ILL., Nov. 14—The Cotta Transmission Co., which has been operated by trustees since its bankruptcy last spring, will be offered for sale Dec. 15 as a "going concern." Frank Wean, referee in bankruptcy, has approved the creditors' plan for disposal of the plant and Rockford financiers are attempting to raise funds to buy in the plant to prevent its removal from this city or its operation by other than local capital.

Thirty-one creditors with claims of \$233,042 favored the plan approved by the referee; 23 with claims of \$165,440 voted to continue the present operation with no fixed plan of its termination. If bids opened next month are not adequate, it is likely the company will continue operation as in the past until favorable offer is secured.

## Stocks Sufficient in Peru This Year

Need for Cars, Trucks and Tractors Will Be Felt  
in 1922

LIMA, PERU, Oct. 27 (*By Mail*)—For the rest of 1921 there is perhaps sufficient stock of automobiles, trucks and tractors here to supply the needs without importations but this will change as the year turns. Parts, accessories and tires will have to be imported even before 1922. The summer begins in Peru in the middle of December and about this time automobiles are in greater demand.

After the summer has passed the next stimulus for the automobile trade will come from the increased buying that always precedes the national holidays that are celebrated for several days in the latter part of July. In the latter half of 1922, the automobile business ought to be in full swing again in Peru.

### Cotton Prices Help

Favorable factors that lend to this view are the increasing strength of the Government and the rising price of cotton, with corresponding response by the exchange. Sugar, wool and other products are expected to accompany cotton in its rise.

There is an incipient movement in favor of good roads, which it is hoped will increase, for it will contribute not merely to the larger sale of automobiles, but to the greater and more rapid development of the country.

The latest increase in the use of automotive equipment in Peru has been in the direction of the truck, rather than either tractor or automobile. In the light truck the Americans appear to be having the advantage, while in the heavy trucks perhaps the Europeans are making the most sales.

The total of firms in the capital that are now or have been recently direct importers of automotive equipment is over fifty. Some have temporarily retired from the business but they may return or their places may be taken by newcomers. This number takes no account of the firms in provinces which are importing direct, and whose number will constantly increase.

The Peruvian statistics show the ports of entry of the automobiles imported, and for 1919, the last year for which data is available, the value of the automobiles that went direct to the provinces without touching Lima, amounted to almost 25 per cent of the total value of the automobiles imported. The growth of automobiles used in the provinces is the first thing to be watched in the future development in Peru.

The number of garages in Lima is also more than fifty. These garages are not strong enough to do direct importing, but they furnish centers for propaganda work. They house each from 7 to 75 automobiles. It may be assumed

there are 25 garages in the provinces.

There are six vulcanizing shops, or tire repair shops in Lima, and as many in the provinces. There are six street gasoline pumps in the capital, and eight, possibly more, small stores where gasoline, oil, grease, accessories, and in some cases, tires are sold.

## BULLETINS

NEW YORK, Nov. 17.—The Seiberling Rubber Co. with a capital of \$55,000,000 has been chartered in Delaware. The principal figure in the company will be F. A. Seiberling, former president of the Goodyear Tire & Rubber Co., who is now building up a chain of small tire plants. The Delaware company will act as a holding corporation for these various enterprises.

DETROIT, Nov. 17.—Announcement is made by the Paige-Detroit Motor Car Co. that Paige dealers will be able to offer a car in the light car field early in 1922. It is stated that plans are so far advanced that the new car can be shown at the New York and Chicago shows although no information has been made public as to specifications or price.

LANSING, Nov. 17.—Quantity production will be started at the Lansing plant of the Durant Motor Co. of Michigan on Dec. 20. It is proposed to turn out 4000 cars by March 1. The work of equipping the plant is being hurried to have everything in readiness by Dec. 20.

### UTAH SUBMITS NEW PLAN

SALT LAKE CITY, Nov. 15.—Bonding company representatives, in accordance with an agreement reached several months ago, have submitted to the commissioner of insurance a new form of policy which, although it is not so broad in its scope as the one which was declared unlawful and non-enforceable by the attorney-general, will still protect innocent parties holding title in a car that may be confiscated through its driver's illegal operations in the liquor traffic.

### DUESENBERG PRODUCING

NEW YORK, Nov. 14.—Duesenberg Automobile & Motors Co., Inc., Indianapolis, Ind., is now in production and delivering cars. It will exhibit at the New York Automobile Salon, to be held at the Commodore Hotel from Nov. 27 to Dec. 3, at which time it expects to appoint its distributor for the Metropolitan district.

### INDORSE SHEPPARD BILL

CHICAGO, Nov. 15.—United States Senator Sheppard's bill to encourage highway motor transportation was indorsed at a meeting here of the executive committee of the Shippers' Warehousing and Distributing Association, comprising traffic representatives of some of the leading manufacturing companies of the country.

## Sees Enclosed Cars as French Favorite

Prediction Also Made That Great  
Market Will Be for  
Small Makes

NEW YORK CITY, Nov. 15.—Henri Depasse, Studebaker representative for France and the French colonies in northern Africa, has arrived in New York with the shipment of \$1,500,000 worth of parts of American motor trucks secured from the American Expeditionary Force camp at Langres, which he will try to sell in this country. Depasse has represented American cars since 1907, when he was Ford representative, up to the present. He considers the sedan or other enclosed types the car of the future in France notwithstanding the favor with which the open type has been held for so many years.

The greatest movement in the automobile industry in France is the development of the small car which was pioneered by Citroen immediately after the armistice. At that time the older French companies openly manifested great opposition to the Citroen organization. Today Citroen is recognized and is in a class by himself in this field.

Recently eleven different French concerns have entered the small car field, and practically all of these makers are unknown in the French manufacturing field. Some of them are stable, well-financed organizations and should prove permanent factors in the industry, while others are not. With gasoline selling at a high price there are many automobiles in France not in use because of the fuel cost.

DePasse believes there is a great market in France for the small car as France to-day has relatively few automobiles in ratio to her population. The low-priced automobile is selling to the farming community and its field is broadening proportionately. To-day the three factors working against the sale of American automobiles in France are exchange, import duty and the price of gasoline.

## N. A. C. C. Seeks Dealer Suggestions for Shows

NEW YORK, Nov. 10.—Considerable attention was given by the directors of the National Automobile Chamber of Commerce at their last meeting to the big shows this year, and it was made plain by them that they would welcome suggestions by dealers as to how the above shows could be made more helpful in promoting the sale of cars and assisting dealers.

The N. A. C. C. is seeking a keynote for the advertising which will be used in connection with the expositions this year. The suggestion has been made that it might be advisable to arrange dinners for the dealers who attend the New York and Chicago shows, but there is a feeling that this would do little to advance the sale of cars.

## Economy Considered In Purchase of Car

Survey Is Made by Dealers Association Among 100 Representative Owners

ST. LOUIS, Nov. 15—Manufacturers could expand the medium priced motor car buying field by impressing upon the prospect that it does not "cost a small fortune to keep that kind of a car," according to the analysis by the National Automobile Dealers Association of a number of inquiries recently sent to buyers. Economy was a prevailing consideration in the purchase of the car. Inquiries were sent to 100 car owners who were divided into ten purchasers from each of ten dealers.

The inquiries as sent out by General Manager Harry Mook of the N. A. D. A. developed some rather interesting things that the dealers could do also to sell more motor vehicles. A number suggested that cars were too much misrepresented by salesmen. Then, the sales manager and the salesmen should agree on what representations are to be made by the salesmen. Some sales were lost because the salesman's story was out of line with the house policy.

Some dealers are still too independent, this questionnaire reveals. Courtesy to the customer was stressed by all the buyers as being much needed among the salesmen in the trade. The salesman should get the prospect behind the wheel.

### Price Cut Not Considered

Some of the salient facts developed by the questionnaire were that 20 per cent of the cars purchased were enclosed models. The purchaser disposed of a used car that on the average was 28 months old which he had driven on an average of 19 months for 17,159 miles.

In purchasing a car the reputation of the dealer influenced 50 per cent in the purchase. In two-thirds of the cases the reputation of the manufacturer was an influence.

Comfort and convenience was a consideration among 75 per cent, possession of the same make of car by friends a consideration in 40 per cent, personal friendship with the dealer or salesman a factor with 20 per cent, and trade-in allowance on a used car with 35 per cent.

A rather unexpected angle to the price situation was brought out in the answer to the following question, "Motor car prices are lower now than for many months. Did price reductions help you to decide to buy now?" Seventy-five per cent said price reductions had nothing to do with it.

### SALEM RUBBER FORMED

SALEM, OHIO, Nov. 14—Salem Rubber Co. has been organized with a capital stock of \$250,000 to operate the plant of the Porter Rubber Co. in this city in the manufacture of cord and fabric tires. E. A. Tinman, Willoughby, formerly of

the Portage Rubber Co., Akron, is president. W. H. Sabol, Niles, president of the Niles Rubber Co., has been elected vice-president J. Schwab, Philadelphia, president of the Philadelphia Motor Tire Co., treasurer, and Grant Hill, Salem, general manager of the Porter Rubber Co., secretary. New machinery will be installed for a daily production of 250 tires.

## More Manufacturers to Drop Distributors

(Continued from page 987)

The feeling is becoming apparent that so far as passenger cars are concerned, sales for 1922 will not exceed those of 1921, which has been a much better year than had been expected. Some car makers believe that there may be a temporary shortage of cars in the spring because of the refusal of dealers to stock heavily and the determination of manufacturers to build only enough cars to meet immediate needs. There will be few manufacturers who will store cars in warehouses this winter.

Passenger car manufacturers have no illusions about the difficult position of the dealers. They do not expect bankers to look with favor upon the stocking of automobiles very far beyond immediate requirements. Many dealers are going out of business, and some distributors who have not shown a profit for the past year expect to discontinue their lines. As a consequence there probably will be reduced selling representation during the next year, not only in numbers but in quality, and this is one of the problems which the industry is facing. The result will be competition for the dealers who remain in the field and the education of new men.

These conditions probably will bring about an attitude of greater independence on the part of dealers who remain in business because they realize that they will have little difficulty in obtaining satisfactory lines. Most of them hope that manufacturers will curtail production for the next few months so that there will be a temporary shortage in the spring. They believe that this would do much to clean up the surplus of used cars now on the market. They blame over-production by manufacturers for much of this trouble. Much of their money is tied up in used cars.

### SEEKS LA CHANCE'S REMOVAL

NEW YORK, Nov. 15—Mrs. Robert B. Honeyman, Jr., daughter of the late John K. Stewart, founder of the Stewart Mfg. Co. and the Stewart-Warner Speedometer Corp. of Chicago, has asked the Surrogate Court to remove her uncle, Leander H. LaChance of Chicago, as administrator of her father's estate. She alleges that her uncle and Martin Taylor, a New York attorney, have mismanaged the estate to their own advantage and that her uncle has caused himself to be elected president of the two companies founded by her father. Her allegations are flatly denied by LaChance.

## Road Act Is Help To Every Industry

Completion of New Highways Will  
Tend to Increase Automobile Sales

WASHINGTON, Nov. 15—Enactment of the Federal Highway Act will be of great economic benefit to all lines of industry, according to opinions expressed in Government circles. The President's conference on unemployment made public a statement showing that 6262 miles of new roads will be built, giving employment to more than 150,000 workers in 30 States. The completion of these roads will naturally have a tendency to increase automobile sales in the territories where sales have been restricted by inadequate highway facilities.

What the new appropriation will mean to the country can be judged by the use of the \$275,000,000 previously appropriated, according to the Department of Agriculture. Practically \$200,000,000 of that money has been put to work in projects which are either entirely completed or now under construction. The exact amount was \$199,823,427 on Oct. 31. To match this amount the States have appropriated \$265,529,090.

### Apportionment Little Changed

It is estimated by the Bureau of Public Roads that the Federal aid roads under construction on Oct. 31 were giving employment to about 250,000 men, either directly on the actual road construction or indirectly in the production and transportation of materials used.

Apportionment of the fund to the States is almost the same as in the previous act, the fund being divided into three parts, one part apportioned according to population, one according to area and the third according to mileage of rural and star mail routes. A new feature is the stipulation that no State shall receive less than one-half of one per cent of the total fund which, in this case, amounts to \$365,625. This stipulation will increase the amount received by four of the smaller States, i.e., Delaware, New Hampshire, Rhode Island and Vermont.

## Ford Shipments Totaled 87,947 During October

DETROIT, Nov. 15—Revised figures on total Ford shipments for October give a total of 87,947, closely approaching the 90,000 schedule set for the month. Early November shipments are continuing high and business is expected to approximate closely the October total.

Foreign trade conditions continue to show improvement. The Manchester, England, plant is turning out over 100 cars and trucks daily. The Copenhagen plant is building approximately 700 cars monthly. Shipments of 2100 cars and trucks were made to the Buenos Aires plant in September and 1650 in October.

## Tire Prices Drop To Lowest Levels

United States, Syracuse and Keystone Follow Action of Other Companies

(Continued from page 992)

NEW YORK, Nov. 14—A reduction in prices on its full line of tires, including cords and fabrics for passenger cars and solid and pneumatic tires for trucks, has been announced by the United States Rubber Co. The reduction cannot be calculated on a percentage basis because the prices vary according to type.

The 30 x 3½ fabric casing has been reduced to \$10.90 from \$15.75. This heavy cut is said to bring the price of this size lower than it ever has been made by any one of the "big four." It is stated that the announcement of the reduction is made at this time to aid dealers in making their plans for 1922. The new prices, which became effective Nov. 11, will extend to tire purchasers throughout the country.

### Syra Cords Lower

SYRACUSE, Nov. 15—Syracuse Rubber Co., Inc., manufacturer of Syrac Cord tires, has announced, effective today, a 20 per cent reduction on its cord casings; 20 per cent on its fabric 30 x 3½ special five ply; and 10 per cent on its cord truck casings, fabric regular casings and cord tubes. The reductions are from the price list of Sept. 1, 1921. The company has added a 30 x 3 fabric tire to its line.

### Keystone Meets Goodyear

NEW YORK, Nov. 15—Reductions which bring prices of its product identical with those of the Goodyear Tire & Rubber Co. have been made by the Keystone Tire & Rubber Co., effective immediately.

### NEW TIRE FOR GOODRICH

AKRON, Nov. 17—While official confirmation is lacking, it is understood that the B. F. Goodrich Rubber Co. soon will bring out a new low priced tire to be called the "Black Diamond." It is reported that the price for the 30 x 3½ size will be about \$10.60.

### SIGNAL TRUCK REDUCED

DETROIT, Nov. 16—M. B. Hoagland, representing the reorganized Signal Motor Truck Co., announces price reductions on the Signal line ranging from \$400 to \$900. The prices follow:

	Old Price	New Price
1 ton.....	\$2,475	\$1,950
1½ ton.....	2,925	2,450
2½ ton.....	3,275	2,875
3½ ton.....	4,275	3,675
5 ton.....	5,300	4,400

It is stated that the company will make no change in the construction of the trucks. Incorporation papers will soon be filed at Lansing after which officers and directors will be elected.

## ACCESSORIES BOUGHT WITH FARM PRODUCTS

ATLANTA, Nov. 15—A co-operative crop marketing plan to assist Georgia farmers in disposing of this year's crops was launched by the Atlanta branch of the Ford Motor Co. at a meeting of the district salesmen.

Under this plan authorized Ford dealers throughout the State will either purchase diversified products from the farmers direct, or sponsor the organization of buying groups for this purpose in their respective communities, with the co-operation of the State Bureau of Markets.

In addition to this plan, all dealers have been authorized to accept as payment for automobile parts and accessories at current market prices, any diversified farm products.

## Burke Sells Sheridan Holdings to Durant

MUNCIE, IND., Nov. 17—D. A. Burke, who purchased the Sheridan Motor Car Co. from the General Motors Corp. with W. C. Durant and associates a few months ago, has sold the major portion of his holdings to the Durant Motor Co. of Indiana. He will continue, however, to be a stockholder in the Indiana company and also in Durant Motors, Inc. There will be no severance of his relations with Durant and it is understood that he soon will accept a high position in the parent Durant organization in New York. The Sheridan car was designed by Burke when Durant was president of General Motors.

### ASKS MICHIGAN APPROVAL

NEW YORK, Nov. 17—The Durant Motor Co. of Michigan has applied to the Michigan Securities Commission for approval of its \$5,000,000 capital stock. Of the total capitalization it is reported that W. C. Durant held \$1,300,000 and the other directors \$1,000 each. The assets of the company are listed at \$1,499,258.

### PATERSON POLICIES UNCHANGED

FLINT, MICH., Nov. 15—Announcement is made by W. S. Paterson, president of the W. A. Paterson Co., maker of the Paterson car, that the recent death of W. A. Paterson will in no way alter the policies of this company.

### AUSTIN FINANCED

LONDON, Nov. 4 (By Mail)—It is a satisfactory sign of the upward trend of the automobile trade here that this week the court has approved a settlement of the affairs of the Harper Bean Car Co. It is also stated that a financier has been found to take up £200,000 10 per cent debentures in the Austin Co.

## METAL MARKETS

WHILE the pig iron and steel markets present a rather uninteresting appearance the aluminum situation shows developments of importance to the automotive industries. The sole domestic producer of aluminum, never given to the blowing of trumpets in matters affecting sales policy, has apparently determined to meet all foreign contestants for desirable business and obviously will not permit price to stand in the way of a continuance of relations with those automotive consumers whose aluminum requirements are quantitatively or qualitatively important.

Amid the conditions that prevail in the aluminum market as the result of cheap offerings of foreign metal, made possible by the continuing abnormality of exchange, and postponement of tariff legislation, expediency dictates the course pursued by the domestic producer which apparently consists of judging each inquiry and order upon its individual desirability and determining price on that basis as a means of maintaining the home market. Stocks of foreign aluminum ingots in the United States are roughly estimated at 10,000 tons.

Certain it is, however, that the tonnage of foreign aluminum now in this country will continue to act as a depressing market factor over many months to come, unless artificial measures are resorted to so as to take most of this metal off the market. Rumor has it that Detroit banking interests took 2000 tons of foreign ingots at 18c. a lb. and are holding the metal for the accommodation of a group of consumers who will draw from this warehouse stock whatever tonnages their operating schedules call for and who are thus relieved of the financial burden of carrying this stock on their own account.

The British aluminum interests are not taking any part in the price slashing contest. They have built up a certain steady trade in the United States and are more concerned about conserving this than about quick liquidation or accumulations. The Swiss and Norwegian producers also refuse to meet the prices named by some of the German and French interests. Amid this international skirmish for American dollars in exchange for foreign aluminum the American producer is no longer permitting grass to grow under his feet, but has seemingly taken what may be characterized as the aggressive defensive when it comes to worthwhile business.

Pig Iron.—The market rules quiet with little probability of incisive changes in its tone over the remainder of the year.

Steel.—No change in conditions is visible. All automotive steels are nominally unchanged in price and the movement continues to be chiefly a hand-to-mouth affair. In sheet prices there continue to be sellers who are ready to make concessions.

Aluminum.—The market for aluminum sheets has turned more active. Foreign sellers name slightly higher asking prices, undoubtedly in response to cables advising stronger sheet markets abroad. Swiss interests are reported to have received an order for 100,000 lbs. of flat sheets at a price supposed to be below 30c.

Copper.—Brass mills are reported to be buying more freely as the result of augmented operations which have now reached one-half to two-thirds of capacity. Most consumers refuse to pay more than 13c. and, if producers will not sell at that level, prefer to await further developments.

## INDUSTRIAL NOTES

**American Tractor & Harvester Co.**, Stuttgart, Ark., has perfected a transmission for transmitting power from the motor of Fordson and other tractors to operate the mechanism of binders and other harvesters. The device consists of five cog wheels with appropriate housing to attach to the rear of a tractor, with a telescoping shaft extending to the binder. The device transmits power to the binder while making short turns, crossing levees, etc. The device is used in the Arkansas rice fields.

**Speedway Engineering Co.**, which has been engaged in the manufacture of valve head, parts and accessories for automobiles, has been incorporated for \$100,000. Plans have been made for expansion and the moving of the concern to larger quarters where production on an increased scale will be undertaken. The directors consist of Rufus E. Welborn, Herbert C. Welborn and Wilbert C. Hunt. The company succeeds the Craig-Hunt Co., which met financial difficulties.

**International Motor Co.** reports that deliveries of its trucks to customers for the first nine months of 1921 were at the rate of 70 per cent of its best previous year. Orders for October were better than for any month since May, and November thus far is as good as October. The company had expected in the third quarter to recover probably two-thirds of its losses for July and August, but the three months showed an actual operating profit in excess of \$12,000.

**International Wheel & Rim Co. of Canada, Ltd.**, has been incorporated under Dominion of Canada charter with Joseph M. Crenan as president and general manager, with temporary headquarters at Toronto. Arrangements have been made that insure production within sixty days of Culp-Crenan steel disc wheels and Culp demountable rims. Associated with Crenan is a syndicate of Toronto and Hamilton capitalists.

**Horrocks Rubber Co.**, incorporated for \$50,000, has been organized by Arthur C. Horrocks, formerly education director at the head of the Goodyear Industrial University in Akron. Horrocks has leased the plant of the Denmead Tire Co., in East Akron, and has started on production of tubes and tire accessories.

**Pre-Selex Gear Shift Corp.** has opened a Detroit office in charge of Franklin A. Miller, vice-president. All sales and advertising work will be handled from this office. The new gear shift is being studied by engineers in a number of leading factories in the Detroit district.

**Kendell Engineering Co.**, Fort Wayne, has been organized by C. A. and R. L. Kendell, formerly connected with the Chopla Piston Ring Co. of Detroit and Auburn, Ind., to manufacture piston rings.

**Steam & Gas Auto Co.**, Birmingham, has changed its name to the McCormack Brothers Motor Car Co., Inc., and has increased its capital stock to \$56,000.

## Gary Truck Acquires Chase Tractor Assets

TORONTO, Nov. 14—Chase Tractors Corp., which has a modern plant in this city, has sold its assets to the Canadian Gary Truck Co., a subsidiary of the Gary Truck Co. of Indiana. The consideration is said to be in the neighborhood of \$1,400,000 although the payment is not all in cash.

The Canadian Gary company will have an authorized capital of \$4,500,000, of which \$500,000 preferred is soon to be offered. The price of the property is given as \$750,000. It is proposed to exchange securities with present shareholders of Chase Tractors on a basis of one share of Canadian Gary, pfd., and a bonus of 50 per cent of common for each share of Chase, pfd.

It is expected that the new corporation will manufacture Chase tractors as well as Gary trucks.

## Underwriters Adopt Limited Endorsements

NEW YORK, Nov. 15—The Western Automobile Underwriters' Conference has voted to put into effect to-day a limited coverage, endorsement and a theft limitation endorsement for Cleveland and Cuyahoga County, Ohio. These endorsements are made mandatory, one or the other but not both, and the rates are reduced 20 per cent for such limitation. They provide that the company shall not be liable for an amount greater than 80 per cent of any actual loss or damage sustained.

The Western conference also has adopted a form of limited theft cover to be applied in Chicago and Cook County, Ill. This is to be effective to-day, and is in the form of an endorsement limiting the percentage of liability for loss from 75 to 95 per cent, according to list prices of cars insured. For the use of the limited cover a credit of 50 per cent of the theft rate is to be allowed on classes of cars where the 75 to 85 per cent limit is to be used.

## Non-Competitors Form Body for Foreign Trade

LANSING, Nov. 14—Associated Machinery Corp. has been formed by Novo Engine Co., this city, Pawling & Harnischfeger Co. and Chain Belt Co., Milwaukee, and the Insley Mfg. Co., Indianapolis, for the purpose of promoting foreign trade.

Each of the companies produces non-competing products and by handling them in conjunction with each other economies are made possible. Equal shares in the stock of the company are held by each member. The officers are Henry Harnischfeger, president; Clarence E. Bement, vice-president, and Clifford F. Messenger, secretary and treasurer. Lionel R. Vinall-Moon is managing director in India and Charles L. Langlotz manager of the New York office.

## STOUGHTON PLANT BURNS

STOUGHTON, WIS., Nov. 16—Twenty complete trucks and the truck plant of the Stoughton Wagon Co. were destroyed yesterday by a fire which for a time threatened a part of the town. The damage is estimated at nearly \$400,000. The fire is believed to have started when one of the workmen passed too close to a tank of gasoline with a lighted acetylene torch.

## BANK CREDITS

*Written exclusively for AUTOMOTIVE INDUSTRIES by the Guaranty Trust Co., second largest bank in America.*

Although the general trend of the money market for the last few weeks has been downward, during the past week, in which there were two holidays, call money, ranging from 5 per cent to 6 per cent as against 4½ per cent to 6 per cent in the previous week, was higher than was expected in some quarters.

Sixty and ninety-day maturities were quoted at 5 per cent to 5½ per cent; four and five months' maturities at 5½ per cent, and six months' maturities at 5½ per cent to 5¾ per cent as against 5 per cent for sixty-day paper, and a range of 5¼ per cent to 5½ per cent for the longer maturities up to six months in the previous week. Prime commercial paper remained unchanged at 5 per cent to 5½ per cent.

The New York Reserve showed a decrease of \$34,691,000 in total reserves, which was largely accounted for by a reduction of \$34,571,000 in total gold reserves. Total earning assets increased \$65,964,000. The ratio of total reserves to deposit and Federal Reserve note liabilities combined decreased from 83.1 per cent to 79.9 per cent, while the ratio of gold reserves to Federal Reserve notes in circulation, after setting aside 35 per cent against deposit liabilities, decreased from 136 per cent to 128.1 per cent.

An important announcement of the past week was that made in the British Parliament that Great Britain is about to resume interest payments on its debt to the United States Treasury. This annual interest charge will be about \$50,000,000 besides the accumulated interest amounting to \$500,000,000.

The report of the foreign trade of the United States for the month of October showed that exports increased by approximately \$21,000,000, while imports gained about \$4,000,000 as compared with the previous month. The total of October exports was \$346,000,000 as compared with \$325,000,000 in September, while October imports amounted to \$183,000,000 as against \$179,283,000 for September. The excess of gold imports at \$39,558,265 compared with \$64,066,492 in the month of September and was the lowest for any month since January. The Official Crop Report of the United States for Nov. 1 indicated that the harvests of all the leading crops are less than for 1920, an aggregate loss of fully 640,000,000 bushels as compared with a year ago being reported.

## BUS SERVICE IN SPOKANE

LANSING, Nov. 16—The Olds Motor Works has received an order from the city of Spokane for 16 Oldsmobile truck chassis. The trucks will be shipped at once and will be used by the city as the nucleus of a municipal bus service which will aid in facilitating the handling of passenger traffic within the city.

## MEN OF THE INDUSTRY

Clyde P. Brewster, active in the automotive industry from its early days, has been elected vice-president and general manager of the Express Spark Plug Co., of Alexandria, Va. He started in 1905 as branch manager of the Jones Speedometer Co. of Chicago and in 1911 became Philadelphia branch manager of the Stewart-Warner Speedometer Corp. Four years later he joined the Edward A. Cassidy Co., Inc., of New York, as district representative, soon being appointed Detroit branch manager. Following the war he became associated with the Lyons Storage Battery Co., Philadelphia, of which he became sales manager in 1920.

Clifton Slusser, superintendent of the Goodyear California Co., has been transferred to the Akron Goodyear factories to assist vice-president and factory manager Paul Litchfield, in revision of staff department personnel. Harry Blythe, personnel director at Akron has been assigned to California in Slusser's place. Whether the change is to be permanent, has not been announced.

F. L. Ryan has been appointed Pacific Coast manager of The India Tire & Rubber Co. of California, distributing branch of The India Tire & Rubber Co. of Akron. Ryan was at one time manager of the Sacramento branch of the B. F. Goodrich Co. and later was sales manager of the Goodrich Los Angeles branch. He will make his headquarters in San Francisco.

Robert G. Elwell, formerly general manager of sales and advertising for the Allen Motor Car Co., Columbus, has become assistant sales manager of the Auburn Automobile Co., Auburn, Ind., and will share in the work of Charles M. Strieby, also assistant sales manager. Elwell will look after merchandising and advertising.

Keith Lindsay Morgan, formerly with the Colt-Stratton Co. and later with the Kelsey Motor Co., is now associated with Wilson K. Farrington, New York, and will specialize in direct mail advertising, particularly as it can be applied to the selling of such products as motor cars, trucks, tractors, equipment and machinery of all kinds.

Truman Berry and Charles Sanderson, Whittier, Calif., have been elected to the board of directors of the Leach Motor Car Co. of Los Angeles to fill vacancies. Berry has been allotted distributor's territory in Orange county, California, and vicinity for the Leach Biltwell car.

Henry M. Lewis, formerly sales engineer with the Hyatt Roller Bearing Co. has joined the Klaxon sales organization with territory covering the eastern territory, including New York, Pennsylvania, Delaware, New Jersey, Maryland and the District of Columbia.

James M. Clarke, sales manager of the National Motor Car Co., Indianapolis, has resigned and moved to Boston where he has taken an interest in the company handling the National and the Earl Motors product for New England.

George B. Hendrick, publicity manager for the Fisk Rubber Co., has been elected vice-president of the Massachusetts Chamber of Commerce and will give his entire time to that work.

William W. Shepherd who for 15 years has been in the automobile advertising field, has joined the Class Journal Co. He will make his headquarters in Chicago.

William H. Edwards, formerly collector of internal revenue in New York City, has been

elected a director of the Keystone Tire & Rubber Co.

C. A. Engelman has been appointed assistant sales manager of the New Era Spring & Specialty Co., Grand Rapids.

E. H. Fitch, formerly with the Goodrich Tire & Rubber Co., has been appointed manager of the Republic Rubber Corp.

Thompson Auto Co., Detroit, distributor of Maxwell and Chalmers, will also distribute the Rolls-Royce in that territory.

A. R. Erskine has been elected president of the Board of Lay Trustees of the University of Notre Dame, succeeding Dr. William P. Breen.

Higher Priced Cars Gain  
in New York Territory

NEW YORK, Nov. 15—Registrations of new passenger cars in the metropolitan district fell off in October 404 from the September record. Figures just compiled by Sherlock & Arnold, publishers for dealers of the *Automobile Sales Analysis*, show a gain in higher priced cars, of which 426 were registered in October, to 331 in September, but the medium and low priced registrations dropped off from 4004 to 3595. The totals were 4334 in September and 3931 in October.

The high month of the year was June, with 7017 registrations.

The figures are for ten counties in and around New York City.

The summary of the year, to date, follows:

	Approximately below \$2,500	Approximately above \$2,500	Total
January .....	483	146	629
February .....	1,409	210	1,619
March .....	3,396	488	3,884
April .....	4,811	575	5,382
May .....	5,468	584	6,052
June .....	6,522	495	7,017
July .....	5,457	386	5,843
August .....	4,216	350	4,566
September .....	4,004	331	4,335
October .....	3,505	426	3,931
Total to date .....	39,307	3,990	43,297

Treasury Extends Time  
to File Amended Returns

WASHINGTON, Nov. 16—Extension of the time for filing amended returns in cases in which appreciated or inflated values have been used in determining invested capital will undoubtedly prove a boon to automobile manufacturers and dealers. Secretary of the Treasury Mellon has extended the time for filing amended returns and making payments of additional taxes due Jan. 15, 1922.

Under the provisions of Treasury Decision 3240, tax payers who had included appreciations in their income and profits taxes for 1917 and subsequent years were required to file amended returns within ninety days and pay the additional taxes. There were many appeals from the automobile industry to the effect that it would be impossible to make payments at this time. In some cases the additional amount due the Government exceeded \$100,000 and it was manifestly impossible to raise this cash by Nov. 24.

## FINANCIAL NOTES

Stewart-Warner Speedometer Corp. in a comparative balance sheet as of Sept. 30 shows assets of \$23,385,353, as compared with \$21,321,226 Dec. 31, 1920. Cash on hand on the former date amounted to \$1,014,169, as against \$32,854 on the latter date. Notes and accounts receivable were \$1,693,640, compared with \$1,528,648 Dec. 31. Inventories on Sept. 30 totaled \$2,671,446, as against \$3,998,697. Among the current liabilities accounts and vouchers payable on the September date were \$187,791, and on the last of the year \$312,407. The surplus Sept. 30 was \$7,961,124 and on Dec. 31 \$8,041,938. On the former date the net assets applicable to the 473,815 shares (no par) of capital stock amounted to \$10,953,050, or \$23.12 per share, after deducting patents, trademarks, good-will, etc., carried at \$9,439,124, or \$19.92 per share.

Federal Motor Truck Co. sales were \$400,000 in October. Third quarter shipments were 35 per cent greater than second quarter shipments and the final quarter of 1921, based on the October record, is expected to be twice the total sales during the second quarter. A comparison of the company's condition Nov. 1, 1921, with Dec. 31, 1920, shows that on the former date assets totaled \$3,695,767 and on the latter \$4,525,340. Cash and securities on Nov. 1 were \$288,876 and on Dec. 31 \$355,798; accounts receivable on the former date \$270,866 and on the latter \$228,310. Among the liabilities, notes and acceptances Nov. 1 amounted to nothing and on Dec. 31 \$352,734, while accounts payable on the date this year were \$63,046 and none on last year's date. The surplus on Nov. 1 was \$778,732 and on Dec. 31 \$806,812.

Kelsey Wheel Co. has been operating close to capacity since June and indications are that high schedules will be maintained through the balance of the year. Since operations in the first half were not greatly curtailed, it is likely that earnings for the full twelve months of this year will exceed last year's record net profits of \$1,916,000, which, after charges and preferred dividends, were equal to \$17.25 a share on the \$10,000,000 common stock outstanding. It is estimated that directors will consider an initial dividend on the common stock in the near future.

Reynolds Spring Co. has declared a quarterly dividend of one and three-fourths per cent on its preferred A stock, payable Dec. 31, to stockholders of record at the close of business on Dec. 22, 1921.

Wayne Oil Tank & Pump Co., Fort Wayne, has issued its ninety-first common stock dividend.

Bill to Prevent Seizure  
of Cars Delayed in House

WASHINGTON, Nov. 16—Filibusters against the Willis-Campbell anti-beer bill in the Senate have delayed the enactment by the House of the Dial bill, which is of particular interest to automobile dealers as it provides for the protection of their equity in motor vehicles in the event of seizure for illegal transportation of alcoholic beverages. The Dial bill was passed by the Senate several months ago. It provides that an innocent party to a seizure for bootlegging should not lose whatever equity is involved in the car.

# Calendar

## SHOWS

- Nov. 14-19—Jersey City, Second Annual Automobile Show of Hudson County Automobile Trade Association, Fourth Regiment Armory.
- Nov. 27-Dec. 2—New York, Automobile Salon, Hotel Commodore.
- Jan. 28-Feb. 4—Chicago, Automobile Salon, Hotel Drake.
- Jan. 7-12—New York, National Automobile Show, Madison Square Garden, Grand Central Palace, Auspices of N.A.C.C.
- Jan. 23-Feb. 4—Chicago, National Automobile Show, Coliseum, Auspices of N.A.C.C.
- Feb. 6 to 11—Seventh National Tractor Show and Educational Exposition, Minnesota State Fair Grounds, Minneapolis.
- Feb. 6 to 11—Winnipeg, Can. Automotive Equipment Show, Western Canadian Automotive Association.

Feb. 20 to 25—Louisville, Ky., Louisville Automobile Show, Auspices Louisville Automobile Dealers Association.

## FOREIGN SHOWS

- Nov. 12-27—Buenos Aires, Annual Motor Show, La Pabellon de las Sosas, Automovil Club Argentino.
- Nov. 26-Dec. 3—Shanghai, China, Automobile Show.
- Nov. 28-Dec. 3—London, Motorcycle Show.
- Dec. 3-14—Brussels, Belgian International Automobile Show.
- March, 1922—Santiago, Chili, Annual Automobile Show.
- May, 1922—Quito, Ecuador, Agricultural Exposition, celebrating Centenary of Ecuador. Automotive Section.
- Sept. 1922—Rio de Janeiro, Brazil, Automobile exhibits in connection with the

Brazilian Centenary Association Automobillista Brasileira.

## CONVENTIONS

- Nov. 14-19—Chicago, Annual Meeting and Business Exhibit of Automotive Equipment Association.
- Nov. 21-23—Atlanta, Third Annual Convention of American Farm Bureau Federation.
- Dec. 6-8—Chicago, Second Annual Meeting of American Petroleum Institute.
- Dec. 10—New York, American Institute of Mining and Metallurgical Engineers.
- Dec. 20—Philadelphia, American Society of Mechanical Engineers.
- Dec. 27-29—Chicago, American Society of Agricultural Engineers, Auditorium Hotel.
- Jan. 17-20, 1922—Chicago, American Road Builders Association.

Jan. 30-31—Chicago, Fifth Annual Convention, N. A. D. A., La Salle Hotel.

Jan. 30-Feb. 2—Boston, Sixth Annual Conference of the International Delivery Association, Copley Plaza Hotel.

June 11-15—Milwaukee, Annual International Convention of the Associated Advertising Clubs of the World.

Sept. 18-23, 1922—Rome, Italy, Second Annual Meeting of the International Chamber of Commerce.

## S. A. E. MEETINGS

- Detroit, Nov. 18, Dec. 23, Feb. 24, March 24, April 28, May 26.
- New York, Jan. 11-14, 1922—Annual Meeting.
- Chicago, Feb. 1
- Minneapolis, Feb. 8—Tractor Meeting.

## Railroad Replaces Trains With Buses

### California Company Will Operate Over Routes Where Tracks Are Laid

SAN FRANCISCO, Nov. 16—The Pajaro Valley Railroad Co., operating between Spreckels and Salinas, has entered the motor bus field in an attempt to replenish its treasury and to make up for some of the losses suffered in competition with motor bus and motor truck lines in that section.

With the granting by the California State Railroad Commission of permission to operate motor buses instead of certain trains over its lines, the Pajaro Valley Railroad becomes the first rail line in the State to enter the field of automotive vehicle operation.

At the hearing on its application for permission to substitute motor buses for certain of its trains, the railroad company's representatives showed that it is and has been for some time losing money, and that the operation of these motor passenger vehicles would replenish the treasury. Accordingly, permission to operate passenger, express and freight service by motor cars was granted to the company, on condition that the same rates charged for train service should apply to the automobile service.

A few permits have been granted in California to operate motor bus and truck lines as auxiliaries to the regular rail service, but never before to operate them over routes where tracks had been laid, and over which regular train service was to be discontinued in favor of the motor service.

## HINKLEY INCORPORATES

DETROIT, Nov. 15—Incorporation papers have been filed by Hinkley Motors, Inc., which will take over all the

assets of the Hinkley Motors Corp. which were sold by the trustee on Nov. 2. The new corporation has taken a long lease on the recently completed Hinkley plant in Ecorse and will begin production of Hinkley motors immediately. The board of directors is composed of C. C. Hinkley, president; Leon Alvarez, vice-president and secretary; Henry M. Butzel, treasurer; Fred J. Fisher, Charles T. Fisher, Louis Mendelsohn and Aaron Mendelsohn.

## Commercial Car Added To Line of Dort Motors

FLINT, Nov. 15—The Dort Motor Car Co. has added a commercial car to its line, the same to be placed on the passenger car chassis with heavier springs.

The new model is built to carry 1000 lb. and is offered as a chassis with lamps, lamp brackets, front fenders, running boards, radiator, hood, windshield, seat frame, cowl board and body to rear of front seat at \$685; with driver's cab and curtains added, \$715; with cab, curtains and all-steel express body, \$780, and with cab, curtains, express body and canopy top at \$825, all f.o.b. factory.

## To Move North American Factory to Springfield

SPRINGFIELD, MASS., Nov. 14—Tire factories in this district are operating at capacity. The Adirondack Tire Tube Co., which plans to absorb the North American Process Co., purposes to move the production of the last-named company's tires from Malone, N. Y., to Springfield.

Paramount Rubber, Consolidated, which holds important patents on seamless rubber goods, is considering a proposal to unite with the two concerns named in building a plant here. Construction plans, as discussed in conference here, call for a factory of about 75,000 feet floor space.

## Dallas Is Expecting November Increase

### All Automotive Lines Share in Improvement During Past Month

DALLAS, Nov. 15—More than 950 automobiles were sold by Dallas retailers during the month of October, of which number more than 800 were new cars. The value of the business done was approximately \$1,275,000. The business transacted by the wholesale dealers, according to the best figures available for the month, was about twice that of the retailers. October sales included more than 100 cars sold at more than \$3,000 and between 50 and 75 selling at from \$3,500 up.

The retail automobile dealers are of the opinion that actual sales for November will equal or surpass those of October. At present the indications are there will be a 10 per cent increase in the retail sales during this month.

The October truck business showed an increase, dealers say, and add that indications are that November sales will be still better.

Automobile dealers and farm implement concerns handling tractors declare the October business in that line was much better than that of the preceding month. They claim the sales thus far in November are exceeding those of October. No figures were available for the actual number of tractors sold by Dallas dealers during the month of October.

## HUNT JOINS CHEVROLET

DETROIT, Nov. 16—O. E. Hunt has been appointed chief engineer of the Chevrolet Motor Co. He will have general supervision of engineering in all Chevrolet plants. Hunt formerly was connected with Packard and Hares Motors.

### The Best Proof of the Four Cylinder Motor Is Its Place in the Truck Field

Trucks are now actually doing 15% of the total land haulage of the country. This is a splendid tribute to the four-cylinder engine, since fully 94% of all truck models are equipped with four-cylinder motors.

To be profitable, truck performance must be as nearly uninterrupted as possible; it must entail low maintenance and must be economical of

gasoline, oil and tires.

The importance of the engine is paramount. It must be steady and powerful, simple of construction and well made to endure in truck service.

Particularly is this true in the speed-truck, where in addition to load, it must cover the ground quickly.

The Lycoming Motor has a well established place in the speed-truck field, because its sturdiness, its dependability and its ability to give consistent service under all reasonable conditions have made of it an equipment asset to both manufacturer and owner of a speed-truck. Write for booklet describing Model "KB" and giving specifications.

Williamsport, Pa.

## FEDERAL BEARINGS

### UNIFORMITY

The Babbitt lining in every Federal Bearing shows the same tough, fine-grained, homogeneous structure because every Bearing is chilled immediately after it is lined.

### SOLIDITY

Every Federal Bearing is guaranteed absolutely free from porosity, because the process of manufacturing makes it impossible for the Babbitt to contain air while cooling.

### 100% BOND

Unlike all other methods of manufacturing Bearings, the Babbitt lining and Bronze Back of every Federal Bearing is Bonded UNDER PRESSURE while the adhering alloy is at a constant temperature.

### EXCELLENCE

Every Federal Bearing is manufactured from the highest grade materials, machined accurately and subjected to the most rigid inspection, because "FEDERAL, DETROIT" must be stamped on the back.

EVERY FEDERAL BEARING IS LINED BY

## Growing Demand for Low Priced Closed Car

Closed car sales have grown in spite of great difference in open and closed car prices. Wide market apparent for cheaper closed models. Break with coach building tradition necessary. Bodies, designed for mass production, necessary and practicable.

**T**HERE is a definite demand for a low-priced closed car. It has become generally recognized throughout the industry that price is the chief obstacle in the way of vastly increased closed car sales. In many ways a rather large part of the automobile public has evinced its desire for closed bodies, but the great differential between touring and closed body prices has prevented that desire from resulting in volume of sales. Norval A. Hawkins stated recently that the automobile owner is the boss of every man within the industry. And it may be added that in the long run this boss is going to get what he wants.

He has expressed a strong desire for closed bodies at a comparatively low price. He believes that the difference between closed and open body prices is too great and that it must be reduced. This is the demand of the boss. The industry must and will meet that demand as it has in the past.

The sale of closed cars has increased very greatly during recent years, despite relatively high prices. Closed cars have constituted a constantly increasing percentage of total production for the last two or three years. In 1919 closed cars comprised 10 per cent of the total production; in 1920, 17 per cent. Regardless of increasing desire on the part of the public for closed cars, however, the sale of this type of vehicle is definitely limited so long as there is so wide a difference in price between it and the open model.

In other words, the increased percentage of closed cars, in spite of the high-price differential, indicates clearly the trend of demand, while obvious financial limitations of certain parts of the public place a fairly low limit on possible ultimate closed car sales so long as this price differential remains.

This growing interest in a cheap vehicle, which will provide protection from the weather and still retain lines pleasing to the eye, has brought the permanent top into considerable prominence. A recent questionnaire, for instance, showed that 33 out of 49 manufacturers who answered feel that there is a definite tendency toward the use of the permanent top as standard equipment. While this, of course, is not directly related to the closed car problem, it is another indication of the general tendency toward a permanent form of protection.

As the automobile has taken its place very definitely as a utility vehicle, a majority of users need an all-year car. Many others, even those who use their cars primarily for pleasure purposes, desire such a model. There are undoubtedly many persons to-day who use open cars throughout the year, often at the price of considerable personal discomfort, simply because of the high-price differential of the closed models.

These facts indicate that there is a definite field for the cheap closed car. Reduced prices on closed

models would automatically increase sales very greatly and would aid materially in eliminating the seasonal character of car selling and production. If a satisfactory cheap closed job were produced many people, in addition to the classes already mentioned, would undoubtedly be interested. People who never considered closed cars before, because such jobs were out of their price range, would immediately become potential buyers. It is significant that the cheapest closed car on the market has the greatest volume of sales, as has the cheapest passenger car. This is natural and, perhaps, obvious, yet has an important bearing upon an examination of the possible market for the cheaper closed job.

### Reducing Production Costs

There are two possible methods of reducing closed body prices. One is to utilize present methods more efficiently and build the usual carriage bodies of the past at a lower price. There is an opinion in certain quarters that the average closed body of to-day could be profitably sold at a lower price.

The possibilities in this direction, however, are comparatively small. To manufacture a closed body which will leave but a small differential from open body prices involves a radical departure from present body building methods. It is the development of a utility type closed body, manufactured rather than built, that gives promise of volume growth in closed body sales.

There will always be a class of buyers, of course, which will demand de luxe closed bodies and fine coach work. But this class does not include the great mass of automobile owners who comprise the market for volume sales. This latter class desires neat, efficient lines and adequate protection from the weather. They want a lower price and to get it are willing to forego a piano-like finish and curves in body and roof which hark back to the middle ages for their origin.

There is nothing offensive to the eye in simple, straight lines. Yet the use of such lines in body design will allow cheaper and more efficient manufacturing methods. The automobile maker has been a pioneer in manufacturing methods in many ways; he has not allowed himself to be hampered by tradition in chassis production methods. Yet the clinging tradition of the coach builder has kept body design and body production methods far behind the rest of the car. There is no reason, fundamentally, for building up every closed body like a small yacht.

Simpler body design will result in simpler construction methods. These, in turn, will bring about standardization and interchangeability, and consequently lessen body service problems. All this can be done without sacrificing, except to a limited extent, the artistic features of the closed body.

Work along these lines has already been started, and at least one company is producing commercially a model which embodies many progressive design and construction ideas. The surface has only been scratched, and the problem is equal in importance to any facing the engineering departments of the industry at present.

It is impossible at this time to point out definitely and in detail how this utility body can be designed and built. This must be the subject of considerable research and experimentation. Yet certain broad principles stand out clearly and form a basis of procedure for such studies.

Some consider it impossible to provide sufficient strength in a delicately rounded body without using expensive forms of construction. It is also difficult to provide water-tightness in bodies of this form without using expensive methods. Construction is expensive because these curves require hand-work. On practically all of the high-priced bodies it appears impossible to

stamp out the metal work on dies. Hand-hammering is required and the hand-hammerers in a body sheet metal department are among the highest paid laborers in this industry.

To mold a sheet of aluminum around the curved corners of a sedan body requires a great amount of skill. It is necessary, to make a successful job, that the sheet metal worker not only hand-hammer the metal to shape accurately, but also, while working on the metal, keep it heated to a temperature which will anneal the metal and free it from internal strains. Even to secure the preliminary form of the curved sheet metal part, hand-hammering must usually be resorted to.

Simple, straight pieces of wood are far less expensive to cut and form than the many curved pieces required in the ordinary type of sedan, town car, limousine or coupe. The average closed body is really a built-up job. It is not made on a quantity production basis. The various units are not put through, completed and assembled as are other parts of the automobile. Consequently, trimming and interior finishing is a lengthy job, involving some of the most exacting methods practised by the upholsterer. Ways can be found to eliminate these difficulties. But precedents must be shattered. The problem must be approached from a fresh viewpoint.

Experts state that if bodies were made so that they could be assembled instead of built up in the usual manner, the time necessary for trimming operations would be reduced from one or two days to two or three hours.

One car recently announced, for example, has its top made as a separate piece. The head lining is stretched across the body before the top is put on. This does away with the intricate fitting and inconvenient interior tacking which is necessary with the usual fixed-roof type of closed car, but which must be done in cramped positions and is therefore slow and expensive.

### Practical Methods

Considering the closed car as a business man's vehicle, used in daily work, several important design concessions could readily be made for the sake of more economical production and lower price. Among these are:

1. Exposed screw heads might be permissible.
2. Straight lines may replace curves without spoiling the appearance or usefulness of the car. The purpose should be chiefly to fill the buyer's needs and increase sales, rather than to satisfy the body builder's ideas of art.
3. The body might be trimmed to some extent with half-round molding or other standard forms of trim which are inexpensive.
4. Four doors are not necessary in a car of this kind. The two extra doors cost a great deal of money, prevent standardization as regards glass sizes, window framing sizes, etc. If such standardization were effected cost would be materially reduced.

These things are simply typical of many others of similar nature, some of which are known and some of which will be discovered, which will effectively reduce closed body prices. Coach builders' tradition, however, must be forgotten, and methods passed down for centuries must be scrapped if progress is to be made.

The primary reason that present closed bodies are so expensive appears to be that too much expensive hand labor is required, and that too expensive materials are employed. When chassis parts are made in quantity certain limits and tolerances are established, and in making the individual pieces the limits are observed and jigs are employed so that when pieces which are to go

together are assembled they fit without hand-work. In short, interchangeability is maintained. In Europe such a thing was not heard of a few years ago and even to-day it is customary to do a lot of hand filing and fitting before chassis parts are assembled. This has greatly retarded the automotive industry there by reason of the great expense involved. The situation with respect to the closed body is similar in this country. We have simply failed to adapt fully our quantity production methods to closed body manufacture.

One reason for this is that body styles change, and expensive tooling is often avoided because of fear that style change will make it necessary to scrap tools before they have served to effect the economy for which they are intended. This situation can and must be changed. The public as a whole will willingly give up the latest fad so long as there is a compensating saving in price and they are not asked—as they need not be—to accept something that is displeasing to the eye.

The interchangeable veneer panel is already produced in quantity, as is the metal panel in some instances. Might it not carry this idea further, but employ methods which will not require hand fitting later? In other words, use jigs and gages which insure perfect assembly without fitting. Again, why not make sub-assemblies which can be quite or nearly finished, including, perhaps, all but the final painting operations? These should be arranged to go together without fail in a final assembly which is built up in a few moments, not fitted together piece by piece, occupying in the meantime, perhaps for a month or more, valuable floor space. Problems of getting good joints and of hiding or rendering inoffensive the fastening means present difficulties, but they are not insurmountable.

It might well be possible to use interior trim that is less expensive than the present costly fabrics, and to prepare this on light frames which can be quickly fastened in place. Such units would, of course, be made on the bench, the covering fastened on by rapid machine methods, and the slow tacking in awkward positions within the body largely or wholly avoided.

In at least one plant closed body roofs are already made in a separate piece and fastened on after some of the trimming is in place. A similar procedure might easily be followed in respect to other units, such, for example, as the complete back framing of the car, if the design was laid out with this in mind.

Cheaper wood can be used for some body parts in which the stresses are lighter than in the more important members, where adequate strength and stiffness is of prime importance.

There is room for much improvement in respect to external finishing. Enameling could no doubt be more extensively used. Painting and rubbing down by hand for a dozen or more coats of paint and varnish gives a fine appearance, but is much too expensive in time and material and not at all in keeping with modern production methods. Spray painting is used for wheels and some chassis parts. It may well be adaptable on body parts, at least for certain kinds of finish or for some of the earlier coats. If a built-up assembly is feasible,

it should be possible to do much painting on sub-assemblies before final assembly.

Some of these are only suggestions which may or may not prove practicable. They should, however, be given consideration in common with all other suggestions looking toward less expensive closed body production, for only in this way will we bring this phase of manufacturing in step or on a par with our advanced methods of chassis part production.

The opinion of men within the industry indicates strongly that cheaper closed bodies are possible and that action along this line can be expected in the near future.

One large body manufacturer who graduated into this business from the old carriage days and who has been president of one of the largest body manufacturing establishments in Detroit, stated: "We will design closed bodies within one year which will cost about two-thirds of what they do to-day."

Another manufacturer is of the opinion that closed body prices can be brought very close to open body prices. He is experimenting with a body which can be built up in units and shipped, if necessary, in this form. He believes that this method, similar to the fabricated ship idea, will result in manufacturing economies and will reduce prices materially.

Some engineers are still of the opinion, however, that the public will not accept bodies built along economy lines which will, of necessity, lack certain features not contained in the coach-built job. A body engineer, whose company produces a \$1,000 car in great quantities, believes that the public demand for full pillars, plate glass, four doors, window regulators, and so forth, is responsible for keeping up the price of closed bodies. This company, however, has been working for five years endeavoring to get a closed, all-steel body which could be finished within four or five days. In other words, make an enameling proposition out of it.

As might be expected, body engineers connected with firms making higher priced cars are not convinced of the possibilities of radical design changes on their product so far as bodies are concerned. Buyers of high-priced cars are always likely to demand the refinements given by coach building methods.

A general survey of the field indicates a strong belief in the possibilities of reduced cost in closed body construction. Body designers and production men will have to co-operate and experiment together to solve the problem. It is almost certain, however, that the body production man is going to play a larger part in body design than he has in the past.

Even at the present time, in fact, there is scarcely a body engineer in the industry who will not admit that he could bring out a cheaper, yet satisfactory, design if he wanted to shatter precedent and perhaps sacrifice something in the way of ornamentation and esthetic beauty. Many believe such a body would create serious sales resistance, however, and are dubious as to the reception which the public might give. It is certain, however, that the public is demanding lower closed body prices, and the problem of giving such prices without arousing prejudice against a new type body is urgent.

---

**WE** must abandon the hand-fitting methods used in the old-fashioned coach builders' and custom body builders' plants and adapt body construction to the same interchangeable quantity production methods used in the manufacture of chassis parts, if the price of the closed body is to be materially reduced.

There is an insistent demand for moderately priced closed body cars which must be met. It can be met only by following the methods which made it possible to produce low-priced chassis. When so met it will greatly increase the market for the closed car, just as the application of quantity production methods increased the market for the low-priced open car.

---

# Several Changes Made in Cole Eight

Improvement made in aluminum alloy piston which now is slotted below ring belt. Thermostats added to cooling system. Pressed steel clutch cone reinforced and provided with clutch brake. Brake operating linkage redesigned and frame stiffened. Improvements in chassis and body.

**A** BRIEF outline of the mechanical and other changes made in the Cole car for the coming season was given in the news columns of a recent issue, and herewith are presented illustrations and further details of these changes. One of the changes pertains to the aluminum pistons which now, as formerly, are of what is described as the constant clearance type. These pistons are cast in metal molds of an aluminum alloy and are slotted circumferentially below the lowest of the three piston rings above the piston pin. The slot is cut by means of a 1/16-in. saw and extends over an arc of 83 deg. on each of the two pressure sides of the piston. By means of central ribs the load due to the gas pressure is transferred directly from the piston head to the pis-

ton bosses. A maximum foot pressure of only 20 lb. releases the clutch. Provisions are made to lubricate the clutch release bearing through a tube located on the front of the dash. This tube leads directly into the bearing and a few drops of oil squirted into it periodically will keep the clutch release lubricated.

Another improvement is the use of coil type clutch springs in place of flat springs. These are mounted in small cages and can be adjusted to give the desired effect. The clutch brake shoe is on a spring and the cone is flanged over with a stiffening flange at the rear against which the clutch brake shoe acts.

Another improvement is the relocation of the centers

(Left)—New Cole pistons are of constant clearance type. (Right)—Sylphon thermostatic valve

ton bosses. There are four rings on the piston, three above and one below the piston pin. The lowest of the three upper rings is a double "pressure-proof" ring. At the top of the piston a clearance of from 0.019 to 0.021 in. is allowed and at the bottom of from 0.0015 to 0.0025 in. From the latter figures it will be seen that the pistons are a snug fit in the cylinder even when cold. By casting the piston with a wide relief area around the ends of the piston bosses a sort of crosshead effect is obtained. Around the bottom piston ring there are eighteen 5/32-in. holes drilled at 45 deg., to act as oil drains, and similar oil drain holes are cut below the lowest of the three upper rings.

An alteration has been made in the water system by the incorporation of thermostats which are placed on the water outlet of each cylinder head and used for the purpose of regulating water temperature and shortening the period of time required for warming the engine. The thermostats are of the sylphon type and are set to open at 150 deg. Fahr.

The clutch has been improved in a number of details. It is still of the cone type with fabric facing, but it now requires materially less pedal pressure to release it and the cone is reinforced at the circumference to prevent distortion. The clutch is equipped with a braking device which begins to function immediately upon release of the clutch and automatically increases in effectiveness as the clutch is withdrawn farther. Its pressure can be

adjusted as occasion demands. A maximum foot pressure of only 20 lb. releases the clutch. Provisions are made to lubricate the clutch release bearing through a tube located on the front of the dash. This tube leads directly into the bearing and a few drops of oil squirted into it periodically will keep the clutch release lubricated. The inverted type with the pivot center below the center line of the axle is now used for the operating link which, in connection with the Hotchkiss drive, gives maximum brake effect without chatter, it is claimed. The leverage has been increased so that light foot pressure will apply the brakes fully. The service brakes are external contracting and the emergency, internal expanding. The brakes are lined with Multibestos and have an area on the service brake of 240 sq. in. and on the emergency brake, 210 sq. in. The reduction from the brake pedal and hand lever to the rear axle is 4 to 1. Oilless bushings are employed in the brake shaft.

The frame has been stiffened considerably in this new model. Additional members have been provided front and rear to prevent side weaving. The independent radiator and front engine support cross-members formerly used are now combined into one rigid, wide unit, materially strengthening the frame to resist twisting strains. A new cross-member is located behind the transmission gearset and ties the frame securely at this point to prevent body strains. Welded, anti-squeak material is now used between all sheet metal parts, and a thick, wide cork anti-squeak is placed between the body and the frame to give a firmer and quieter support for the body. The spring shackles are now made adjustable to permit of eliminating noise caused by side slap, and the radiator

# Engineering Features of British Cars Evidenced at the London Show

Marked increase in number of 70 cu. in. engines one outstanding feature. Gains in percentage of overhead valves, aluminum pistons, pressure lubrication, heated manifolds and spiral bevels are noted. Magneto ignition still predominates. Four-speed gearset is losing ground.

By M. W. Bourdon

**T**WO features stand out prominently after a study of the exhibits at the London show. The first is the increasing number of makers who apply their energies to more than one or two chassis models, and the second is the large number of new chassis with engines of approximately 70 cu. in. displacement, offered either for two-seated bodies with dickey seats or for small, four-passenger bodywork.

Concerning the multiplicity of chassis models, this was a feature of British plants before the war, but at the 1919 show there was a clearly apparent tendency to specialize. Many firms who had previously offered up to five or six different chassis had got down to one or perhaps two. But at this year's show the old order is again in evidence. Wolseley, for instance, has four entirely different chassis of 7, 10, 15 and 20 hp., including one two-cylinder and one six-cylinder model. With these four chassis is offered a range of bodies numbering nearly twenty, taking into account alternative equipments.

In my cabled report of the show I referred to the comparatively large number of new models falling within the light car class. At Olympia this type was shown by such well-known firms as Wolseley, B. S. A., Standard and Rover, as well as by over twenty others of less renown. It shows considerable divergence in power plant practice, as will be realized when it is said that the little Wolseley has a horizontally opposed twin-cylinder, water-cooled engine, the B. S. A. a 90-deg. Vee air-cooled, the Standard a four-cylinder, water-cooled overhead valve, and the Rover a horizontally opposed, air-cooled engine. Then, too, the Wolseley has a unit power plant, in which it resembles the Rover; the B. S. A. has an amidships gearset, while the Standard has it bolted to the head of the propeller shaft casing.

Most of these miniature cars are offered as two-seaters, some of them with a dickey seat. They weigh in this form from 1000 to 1300 lb., which is quite sufficient load with a full complement of passengers for engines of less than 70 cu. in. displacement. In several cases, however, they are offered with small, four-passenger bodies and then weigh little, if any, more than the two-seater with dickey. But this phase of British automobile development is so important that it is proposed to deal with it separately on another occasion.

Meanwhile it may be said that the light four-seaters with engines of from 75 to 100 cu. in. are still developing and are in even greater favor. In some cases the engine has been slightly increased in size to cope with the additional weight of better bodies, heavier axles or longer springs. But the type remains, and to suggest to a

maker that his "light car" is no longer in that category is to raise in him something approaching ire. The light car is by far the most popular type at the moment, but where the class begins and where it leaves off it is impossible to say.

Two concerns associated with the S. T. D. combination—namely, Sunbeam and Talbot—have put forward new overhead valve models which are small, high-class jobs. These have 14-hp., four-cylinder engines (2 13/16 x 4 3/4 in.) and, with four-passenger bodies, sell at £720.

In what may be termed full-size cars there has not been much development during the past year. Armstrong-Siddeley has come forward with a new 18-hp., six-cylinder model having the main characteristics of the 30-hp. model, which is being continued. The additions of Straker-Squire and of Guy were referred to in my cable. Talbots are offering a 15-hp. and a 25-hp. as new types, though they are of the same general design as those they displace.

The only radical departure from normal practice in cars over 15 hp. is in the new 20-hp. Vulcan, which has a cuff valve engine, a short sleeve being reciprocated above the cylinder proper by means of a two-cycle cam groove. This design is claimed to enable 82 b.h.p. to be developed at 3200 r.p.m. by a four-cylinder, 3 1/2 x 5 1/2-in. engine, with an m.e.p. of 114 lb. and a compression ratio of 4 1/2 to 1.

## Number of Cylinders

This year's show does not bring to light any marked move away from the outstanding popularity of four cylinders, as was made apparent by the figures given in my cable report. There are more two-cylinder engines than last year, and these now represent 8 per cent of the total.

The Guy "8," with cylinders set V fashion, is alone among British cars representative of this type, and the same can be held to apply to the Leyland straight 8, though brief particulars are to hand concerning two new British-built cars with engines of this type.

Detachable cylinder heads have slightly increased in number, and now they are found on 53 per cent of engines, as compared with 49 last year. Block-cast four-cylinders have given way slightly on account of the prevalence of pair-casting in recent introductions, but are still found in 90 per cent of all four-cylinder motors. Among six-cylinder engines all possible groupings are met with; pairs and threes predominate, with 40 per cent each, blocks and singles being represented by 10 per cent each.

The plan of forming the cylinder block as a unit with the upper half of the crankcase has been adopted on

(Upper left)—Straker-Squire 30 hp. six cylinder engine, unique in having overhead camshaft on separately cast cylinders. (Upper right)—Leyland straight-eight block engine, camshaft driven by triple eccentric rods. (Lower left)—Power unit of new 12 hp. (2 $\frac{3}{4}$  x 4 $\frac{3}{4}$  in.) Star. (Lower right)—Enfield-Allday generator-magneto cylindrical support brackets, with silent chain drive to magneto

the new 20-hp. Vulcan and the new 14-hp. Sunbeam and Talbot aluminum engines. These, however, are the only representatives of this type of construction, cast iron for the cylinders and aluminum for the crankcase being almost universal.

#### Valve Arrangement

Overhead valves have increased in popularity, now constituting 24 per cent of the total (+2.5 per cent), while L-head cylinders, with 66 per cent to their credit, show a drop of 6 per cent. Three makers are using sleeve valves, all of a different type—namely, Daimler with the Knight, Argyll with the Burt & McCullum and Vulcan with the Howard. These are isolated cases where the inlet valve is superimposed on the exhaust, but this arrangement is not seen on cars of any great renown.

As regards push-rods and rockers for overhead valves, rarely indeed does one fail to find some special provision for automatic lubrication of the rocker bearings and their joints in the push-rods. In the 11-hp. (now 8x4 5/16 in.) Standard, the 18-hp. and 30-hp. Armstrong-Siddeleys, the Lanchester, Wolseley and one or two others the rockers or the overhead camshafts, as the case may be, receive pressure lubrication from the main system. In the new Sunbeam engines, all of which have push-rod operated overhead valves, and in the 14-hp.

Talbot a branch pipe from the main pressure system is carried along over the rocker shaft, and has small holes drilled on the underside of it to allow drops of oil to fall on to the grooved upper surface of each rocker, a central hole with a countersunk top end carrying the lubricant to the pivot bush. On the new 8-hp. Standard the whole rocker shaft is plugged with wick, and at its front end is a large oil cup, replenishment of which is said to suffice for 500 miles or so. In all cases mentioned, except the last, excess lubricant drains back into the crankcase, the overhead valve gear being inclosed by an aluminum cover plate.

#### Distribution Gear

In engines with the camshaft in the crankcase the silent chain has still further gained in popularity, being represented on 60 per cent of engines, but, strangely enough, the helical gear has receded in favor of straight-toothed form, which twelve months ago seemed likely to disappear entirely. To a certain extent this is due to the new two-cylinder engines. Overhead camshaft drives are found in half a dozen different forms. Wolseley retains the primary silent chain to transmit the drive to a vertical shaft with bevel gearing. Lanchester and Ensign have worm gearing at both ends of the vertical shaft, other makers utilize helical gearing, spiral

Front end of 7 hp. Wolseley horizontal twin engine, showing ignition unit and generator at rear end of fan shaft

bevels and a direct transmission by silent chains, while Leyland uses a triple-eccentric, connecting-rod device. The overhead camshaft, incidentally, is not confined to the largest and most expensive cars, for it appears on the new six-cylinder, 12-hp. A. C., 11-hp. Beardmore, 18-hp. Phoenix, two Wolseleys and a new 9-hp. light car which still has to make a name for itself.

#### Water Cooling Systems

The plan so greatly in evidence at the 1919 and 1920 shows of providing a belt transmission for the pump, or for what was merely a water accelerator in a thermosiphon system, has appreciably lost favor, and, instead of only 55 per cent of engines having a positive pump drive, some 80 per cent now have this arrangement. Cellular radiators have increased from 68 per cent to 76 per cent, and, of the tubular radiators making up the remainder, quite one-half are of the film variety, the tubes being flattened out so as to provide a water space of less than  $\frac{1}{8}$  in. width and 1 to 2 in. deep, the "pack" having radiating fins soldered on. Tubes of this type and also those of round section are invariably vertical.

A pressed steel radiator shell is used by only a single firm—Armstrong-Siddeley. Sheet brass, usually nickel-plated, is used in 63 per cent of radiators, though this represents an appreciable reduction since last year, for something like 30 firms are now using a white metal casing. The latter appeals to the owner when a polished radiator is provided, for although it tends to become dull more rapidly than nickel-plating, it can, like plain brass, always be brought back to something approaching its original appearance, even when neglected for comparatively long periods. Aluminum casings are in evidence, but only to the extent of 5 per cent.

Thermostatic control of water temperature is found only on the largest and high-grade chassis; Napier, Straker-Squire, Leyland and Rolls-Royce have it, the latter firm having adopted it only quite recently.

#### Engine Mountings

The great majority of British engines (75 per cent) are mounted directly in the main frame; four-point attachment is most in evidence, the three-point suspension in the main frame being found on only 27 per cent of chassis. Where subframes are used the engine rests upon the latter at three points. Subframes themselves have four points of support in 65 per cent of cases, three-point in 15 per cent, and are secured to the main frame at six and even eight points in isolated cases.

A greater number of British engines for 1922 have aluminum pistons, just a third of the total being so provided, as compared with 26 per cent last year. Cast-iron pistons make up most of the balance, though there are two examples of steel pistons and one a built-up type of cast iron and aluminum. The slipper type of piston and also the hour-glass pattern have made no headway, and 88 per cent of cast-iron and aluminum pistons are of the straight-sided variety. Most new engines have the piston pins floating in both rod and piston bosses, with aluminum or brass end plugs. At the present time the percentages of the various arrangements of the piston pins are: Fixed in rods, 23; floating, 32; fixed in bosses, 45.

Three compression rings are used in most cases, though in the smaller engines two are made to suffice, while in cars like the Lanchester, Napier and Sizaire-Berwick four rings are used above the piston pin. Rolls-Royce continues to use six. Fifty-six per cent of pistons have no special provision for preventing excess of oil from reaching the combustion chamber; 27 per cent use a scraper ring in the piston skirt; in 17 per cent the bottom compression ring is made to serve as a scraper by the usual means of a beveled lower edge to its groove with small holes drilled through to the interior.

#### Engine Lubrication

There is a further increase this year in the number of engines having the hollow-shaft system of lubrication, for this appears with modifications in 57 per cent of engines as against 49 per cent last year; but only three makers use a full-pressure lubrication system by carrying leads from the big ends to the piston pins. The circulating splash arrangement has given way appreciably and at present is used on only 18 per cent of British cars. Twenty-two per cent have a combined trough and pressure system in which direct leads from the pump circuit are taken to the main shaft journals and frequently also to the camshaft bearings. In some of the miniature cars a simple splash system is depended upon, the supply of lubricant in the crankcase being replenished occasionally by means of a hand pump within reach of the driver.

Gear pumps are still by far the most popular, the plunger variety being found on only 24 per cent of engines, approximately the same as last year. The vane pump is used in four engines only. Standard, in the new 8-hp. model, has a sheet metal disk of approximately 12 in. in diameter attached to the rear flange of the crankshaft, within a narrow compartment at the rear of the crankcase. It has tongues cut at several points in its circumference, and in rotating it lifts the oil to

Thermostat on Straker-Squire operating radiator shutters is located within a casing projecting into the radiator top tank

(Upper left)—Enfield-Allday gearset with three-point trunnion support. Drum of external shoe brake is enclosed within casing extension for spherical housing of torque tube. (Upper right)—Three-speed gearset at front end of torque tube on new 8 hp. (67 cu. in.) four cylinder standard. Drive shaft passes through centre of spherical trunnion support. (Lower left)—Pedestal above gearset of Galloway chassis to form gate, with reverse stop, for spherically mounted gearshift lever. (Lower right)—Cast aluminum plate on Briton floorboard to carry hinged reverse stop for spherically jointed gearshift lever

inclined galleries, enabling the lubricant to run to troughs under the big ends. This, of course, is merely a variation of the flywheel system of lifting the oil, which system, by the way, appears for the first time in a British car of new make.

Last year approximately 40 per cent of British engines had the oil pump located either at the end or the side of the camshaft, but now 77 per cent have this unit submerged in the sump driven by vertical shaft and helical gearing from the camshaft.

Inaccessibility of the crankcase oil filter is a subject for frequent criticism by users; they are told by makers, especially those who use hollow crankshaft lubrication, to inspect and clean their filter gauzes frequently, and yet no attempt is made by the majority of designers to facilitate this operation, which usually means crawling under the car to remove the flange nuts holding the filter in place.

#### Carburetion

The Zenith carbureter is by far the most popular type, the horizontal pattern being used in most instances. In a few instances the new triple venturi model is adopted. Thirteen per cent of engines are fitted with

the car manufacturer's own carbureter. The Claudel is used on 9 per cent of engines as against the 58 per cent of the Zenith.

In two engines out of three the carbureter is on the right of the cylinder block, the valves being on the left in accordance with predominating European practice. Not always, however, does this arrangement imply an induction passage through the block, for only 40 per cent of the total number of engines have this feature. In some cases the inlet pipe passes either over the cylinder block or around the front of it, both of which are obviously undesirable arrangements.

Vaporization appears to have received rather more attention than hitherto, and the writer observed eleven different provisions to this end. The most favored plan is to depend solely upon heat absorption through the walls of the inlet passage through the cylinder block, but this provision is supplemented in 11 per cent of cases by an integral inlet and exhaust manifold, in 5 per cent by a water jacket, in an equal number of cases by a hot air supply and in one instance by a water jacket and an integral manifold. In the 16 per cent of engines having integral inlet and exhaust manifolds alone to assist vaporization, the attempts to embody a hot-spot

(Left)—Rear view of 18 hp. Phoenix. Production only now commencing, having been intentionally held up for 12 months owing to state of trade. (Above)—Semi-enclosed propeller shaft on new 9 hp. Beisize. Coupling shaft has rear bearing on crossmember

are distinctly crude in the eyes of those who realize the potential benefits of such an arrangement properly carried out.

The vacuum system of fuel feed has increased from 30 to 39 per cent since last year, gravity feed has fallen from 56 to 54 per cent and pressure systems have dropped from 14 to 7 per cent. It will be realized from the foregoing that the gravity system is still the most popular. Generally speaking, complaints as to the derangement of the vacuum tank have been infrequent, and the additional expense of installation is the chief obstacle to the more extended use of vacuum feed.

#### Electrical Equipment

The magneto retains its predominance among British cars appearing, as last year, on nearly 90 per cent. On Rolls-Royce, Napier, Lanchester and one or two other top-grade cars both magneto and battery are still supplied, but the battery system alone is found on less than half a dozen of new cars, including the little Standard, the 14-hp. Sunbeam and one of the Talbots. Wolseleys have battery ignition on three models, but in the case of the two post-war types which were introduced at the show of 1919 magnetos appeared in the production models only quite recently.

The battery system used by Wolseley is made by a subsidiary company which was formed during the war to take over the Bosch stock and good will in England, and unless it may be assumed that Wolseleys imagined that the British public was not sufficiently educated up to a battery ignition until recently, it must be inferred that the equipment it was proposed to use has not been sufficiently tried out.

Two-unit equipment for lighting and starting is found on 91 per cent of British cars. The single-unit motor generators are almost invariably made by Lucas and driven by silent chain from the distribution gearing. The 12-volt system is the most popular in the proportion of 2 to 1, and the majority of the 6-volt sets are fitted to small cars without electric starter. Ground return wiring is rare.

In three or four of the miniature cars a hand-operated mechanical starting device is fitted, this addition to the usual starting crank allowing the crankshaft to be rotated half a revolution at a time from the driving seat,

a third lever on the right being provided for the purpose. The new 8-hp. Standard has an arrangement of this kind, which consists of a rack and pinion located near the front of the crankshaft, the pinion being cut on an over-running clutch for the starting crank. The rack has a gap at the end of its range of teeth, this gap lying under the pinion when the engine is running normally, so that the clutch is only in operation during the process of starting. Something of this kind is found also on the Armstrong-Siddeley sixes, though in these an electric starter is used. The latter drives the front end of the crankshaft through chain and sprockets, the driven sprocket moving axially when it commences to turn, causing clutch teeth to be engaged before the crankshaft is rotated.

Last year 80 per cent of British cars had a belt drive for the generator, a feature which the writer criticized severely at the time. It is worthy of note, therefore, that this percentage has now decreased to 62. Quite an appreciable number of entirely new models, however, have belt-driven generators.

#### Engine Bearings

For six-cylinder engines the seven-bearing crankshaft is in the majority; 18 per cent have three journals only and 35 per cent four. Engine dimensions have seemingly no influence on the number of bearings except in the largest motors, for while the new A. C. and Singer sixes, with 2 9/16 x 3 15/16-in. cylinders, have four journals each, the 18- and 30-hp. Armstrong-Siddeleys have only three apiece.

In four-cylinder engines three crankshaft bearings are most common, appearing in 60 per cent of cases. Two only are next in favor, while five journals are used in 10 per cent; the smallest engine having five bearings is the new 12-hp. Austin, a similar number being used in the 20-hp. model.

Plain journal bearings are almost universal, ball bearings being used in only 6 per cent of engines, ball and roller in 5 per cent and roller in 1 per cent. The majority of these diversions from standard practice are met with in engines of from 70 to 100 cu. in. displacement.

Three is the usual number of bearings for the camshaft, though 29 per cent of engines have only two,

Enfield-Allday steering; has vertical shaft for worm wheel with transverse rod to left hand swivel

New type of Marles steering gear

while 21 per cent have four. In three engines five camshaft bearings are used and in four engines seven, all the latter being six-cylinder jobs.

Camshaft bushes are of phosphor bronze in approximately half the total number of engines and white metal in a third. There are 9 per cent of cast iron, 6 per cent of ball and 3 per cent of ball and phosphor bronze bearings combined. One engine has a ball bearing in the front cover of the cam gear housing and three plain bushes spaced along the crankcase.

Comparatively few gearsets have other than ball bearings for the mainshaft and layshaft; only one has plain bushes for both shafts, though 14 per cent of layshafts have phosphor bronze bushes at both ends. Roller bearings are fitted on only 9 per cent of mainshafts and 6 per cent of layshafts, though one maker uses for the latter a ball bearing at one end and a roller bearing at the other. Plain bushes are, however, preferred to ball bearings for the pilot bearing, though in half a dozen cases these are of the floating bush type. Lubrication of this bush is generally provided for by a hole drilled through the constant mesh pinion at a point between two of the teeth, so that the engagement of the gears in rotating provides a pumping effect, driving the oil into the pilot bearing.

But, despite the predominance of plain bushes for the pilot, the use of ball bearings is increasing; they are now found in 30 per cent and roller bearings in 8 per cent of gearsets.

When roller bearings are used in gearsets they are usually of the cylindrical type and usually supplemented by a ball journal at the front of the constant mesh wheel on the main shaft. As regards prevention of oil leakage from transmission cases, the popular method is a felt gland at each end of the main shaft, though this in a few instances is supplemented by the familiar thrower ring type of oil guard outside the gland.

### Wheel and Axle Bearings

Ball bearings are again the most popular in both front and rear wheels, and the combined radial and thrust type is almost universal. Roller bearings, usually the Timken variety, are fitted, however, in 27 per cent of front wheels and in 17 per cent of rear wheels. One

ball and one roller bearing, the latter of the cylindrical type, are fitted in 9 per cent of front wheels and in 6 per cent of rear wheels, full floating rear axles invariably accompanying this combination.

At each side of the differential casing ball bearings also predominate; Timken rollers form the majority of the exceptions, which aggregate 15 per cent. Only 7 per cent of rear axles are of the non-floating type and these are mostly on quite small cars; of the remainder, 51 per cent are full floating.

### Clutches

While the cone type of clutch in its several variations constitutes 52 per cent of the total number, this represents a small decrease as compared with last year. The majority of the loss has gone toward the single dry plate type, though there are 14 per cent of multiplate clutches as compared with 12 per cent last year. Three of the cone clutches have metal-to-metal friction surfaces, aluminum to cast iron, running in oil. Phoenix has been a continuous user of the latter arrangement for ten years or more, and embodies it in the new 18 hp. model.

Rover is still the only maker using single plate clutches running in oil and even in this case a dry fabric friction surface is used in the 8 hp. chassis.

Wolseley for many years past has used nothing except the multiplate in oil type of clutch and still retains it on three models, though the new two-cylinder chassis has an inverted cone with a fabric lining. Vauxhall has adopted a dry plate pattern for the new 14 hp., retaining the multiplate in oil type for the larger models. Belsize in a new 9 hp. chassis with the Bradshaw air-and-oil-cooled engine has adopted a multiplate in oil clutch. Armstrong Siddeley continues a dry multi-plate clutch on the new and smaller model (18 hp.), but has a dry single plate in the new Stoneleigh light car. In this case, the driven disk is of fabric and merely has a steel boss floating on the front end of the splined coupling shaft, for which it forms the front flexible joint.

From the foregoing it will be gathered that the dry single plate clutch is making most headway, though in a good many quarters the objection is still raised against it that the thin metal disk is liable to warp and cause

Peculiar mounting of rear quarter elliptic spring on new 14 hp. Turner with parallel radius rod

Rear springing of 7 hp. two-cylinder Wolseley. Single upper blade assists in taking torque and drive

fierceness and chattering if it should be slipped much.

The cone clutch has the merit of simplicity and when fabric covered can stand an indefinite amount of slipping. Gear shifting is no more difficult with the best examples of cone clutches than it is with the best of the single plate type. This is possibly due to the extensive use of aluminum for the driven cone, although in quite a number of instances a pressed steel driven member is used.

#### Transmissions

Seventy-three per cent of all dry clutches, cone and plate, have fabric facings, but leather as a friction material is still in evidence in the cone type to the extent of 13 per cent. Cork inserts are used by one maker (Morris) in a double plate clutch and wood as a friction material has actually appeared in a new make of car.

Ball journals for the pilot bearings of clutches are still comparatively rare, the vast majority being plain bushes. Ball bearings for the clutch yoke are, however, universal.

The unit power plant construction has made no appreciable headway since last year, and only 27 per cent of British cars have it. The amidships location is still in the majority, but it has fallen from favor during the year as the present percentage being 56, as compared with 68 last year. Three additional makers have adopted the plan of forming the gearset as a unit with the front end of the propeller shaft and the unit gearset and rear axle construction appears on 10 per cent of cars, as compared with 6 per cent last year.

Selecting 24 new models shown at Olympia, it is found that 7 of them have an amidships gearset, 10 have a unit power plant, 5 have the gearset a unit with the propeller shaft, and 2 with the rear axle. Thus, of the two dozen, 17 avoided the unit power plant arrangement.

Last year the number of gearsets with three and four speeds respectively were exactly equal in number, but this year 58 per cent have three speeds. The favored position of the gear-shift lever remains on the right-hand side of the chassis, 70 per cent being so placed and 29 per cent central. One maker—Vulcan—on one model makes this item optional. Of 24 new cars, 13 have the gear-shift lever on the right.

Where the gearset is amidships, the coupling shaft from the clutch has a fabric disk joint at each end in 46 per cent of cases. Metal disks and leather disks are in evidence to the extent of 4 and 13 per cent respectively. All-metal joints (usually a pot joint at the front to allow for the sliding movement of the clutch and a star joint at the rear) occur on 20 per cent of coupling shafts, while 17 per cent have merely a sliding coupling at the front end and a Hooke's joint at the rear.

The steel worm and phosphor bronze complete worm wheel type of steering predominates, being found on just over half the total number of cars, the worm and segment on 26 per cent. The remainder are divided between screw and nut (8 per cent), epicyclic, rack and pinion and volute cam. The Marles, which is of the latter type, has been considerably altered since last year, now having only one ball bearing forming a roller mounted on a projecting boss of the lever shaft, instead of two ball bearing rollers as last year actuated by the snail cams. This year's model has two volute cams with their small diameters united, and these take effect simultaneously on the ball bearing roller at diametrically opposite points of its circumference. This new model gives a quicker steering than the old, and, like the original, is reversible; but users find it quite as precise and controllable as the other, while it has the merit of being a far better manufacturing proposition according to the firm handling it.

Rack and pinion steering gears are used only on the smaller types of chassis, such as the 8 hp. Rover.

#### Propeller Shafts

The open propeller shaft with Hotchkiss drive has gained slightly during the year, being used now on 52 per cent of British cars. The enclosed pattern has receded slightly and the same applies to the semi-enclosed arrangement, in which a short open coupling shaft is interposed between the gearset and the enclosed propeller shaft proper. Wolseley is the main exponent of this latter system.

With enclosed and semi-enclosed shafts, the star (cross) type of universal joint is fitted at the front of the enclosed portion in 64 per cent of cases, a fabric disk in 23 per cent and a sliding pot joint in 3 per cent.

Open propeller shafts have a fabric disk joint at each end more often than last year, this arrangement having increased from 28 to 40 per cent. Next in favor (29 per cent) is a cross joint at the front and a sliding pot joint behind. Daimler is the only maker using cross joints with ball bearings, one at each end of an open shaft, and one firm, Enfield, uses roller bearings for this type of universal.

It may be mentioned incidentally that the use of fabric disk joints for propeller shafts is increasing mainly in connection with cars up to 12-15 hp. In some cases the flexibility of the disks is alone depended upon to take up variations in centers due to the flexing of the springs, though where the disks are not more than 48 in. apart the star piece of one of them is allowed to float on the end of the splined shaft.

As might be expected the spiral bevel has still further gained on the straight bevel for the final drive in

Cast cruciform hub flange of channel section on new Standard light car with disk wheels

the rear axle, occurring in 63 per cent of chassis as compared with 46 last year, while the straight bevel has receded from the 28 per cent in 1920 to 13 per cent now. Not much variation has occurred, however, in the number of worm drives; 12 per cent of chassis now have a top worm and an equal number a worm below the axle, this total of 24 per cent comparing with 26 per cent last year.

Where the drive and torque are not both taken by the springs with an open propeller shaft, the springs to take the drive and a torque arm are the usual combination; both radius rods and a torque arm are used in only one car. Vauxhall has the former arrangement in two models and Wolseley in the 20 hp. six-cylinder chassis. In the Napier Six, the new 14-hp. Vauxhall and the 10 and 15-hp. Wolseleys, having either an enclosed or a semi-enclosed propeller shaft, the springs are made to serve for transmitting the drive, the propeller shaft casing absorbing the torque only.

### Brakes

The percentage of chassis with both brakes on rear wheel drums has increased from 61 per cent to 68 per cent since last year, though there is only one car having internal shoes and contracting bands on the same drum. Transmission brakes, therefore, are found on 32 per cent of cars, these being mostly of the external shoe type, and only Daimler has an external band brake on the wheels accompanying an external shoe brake on the transmission.

The increase in the use of steel cables for brake operation, which was apparent last year and was regarded by many as a retrograde step, has continued, and this feature is now coming to be taken as a justifiable alternative to rods, if not actually preferable in certain respects. Usually the cable ends are adjustable without great difficulty, and in a few instances they are more or less permanently secured in the eye of a threaded solid extension to allow for a finger nut adjustment.

Only one British car is fitted with front wheel brakes—the Sheffield Simplex six-cylinder, introduced at last year's show. This car has not yet gone into production and has poor prospects of reaching that stage for awhile; yet it was again at Olympia this year—the selfsame chassis with front wheel brakes added!

Half-elliptic springs all around is a combination more

in use than any other, though it has decreased from 48 to 43 per cent since last year. Next in popularity is the combination consisting of half elliptics at the front and cantilevers at the rear, viz., 22 per cent, a gain of 1 per cent. Quarter-elliptics at both back and front have increased from 16 to 20 per cent, while half and three-quarter elliptics together have dropped from 15 to 12 per cent. There is only one British car with transverse inverted half elliptics; another rare combination is found on the new 9-hp. Vulcan, which has three half-elliptics on each side, the front two being inverted—each mounted like a cantilever on a central trunnion bearing—the inner ends of these two being coupled by the third similarly arranged.

Wrappings for springs—either leather “gaiters” shaped to fit or specially prepared tape wound on from end to end—are being widely used, being not only bought as accessories and fitted by owners to existing cars, but also supplied as standard by many makers of cars, large and small.

Some wrappings are fitted after the contact surfaces of the spring leaves have been polished but left dry, while others constitute grease bags to keep a supply of lubricant between the leaves. In the former case the gaiters merely serve to prevent the entry of water and the formation of rust on the contact surfaces and thus prevent deterioration in the suspension system. In the other case, they again exclude water, but also reduce the frictional effect and counteract the comparative harshness of somewhat inflexible springs.

### Wheels and Tires

The hollow pressed steel wheel again leads (48 per cent), but it has lost ground during the year to the disk type to the extent of 8 per cent. Disk wheels are used on 29 per cent, wire on 18 per cent and wood on 5 per cent.

Originally the only pressed steel wheel available was the Sankey, but now there are several other firms making this kind of wheel, including Dunlop and Goodyear (no connection with the tire company).

The Goodyear wheel is different from the Sankey in that it has a separate rolled steel rim which is welded

Lanchester aluminum dashboard with side lamps of ship's ventilator pattern normally projecting through cowl

into the halves of the main portion of the wheel. An advantage claimed for this arrangement is that air pressure within the tire does not impose an outward stress upon the welded joint, the tire and rim as a unit being self-contained in respect to inflation pressures. Until this year the writer viewed this claim as having no force in practice, whatever might be said of it in theory; but he has within the past six months experienced two cases of cracked wheels of the original type which had split around their circumference under the air tube. But the faults appear to be due to faulty welding rather than to the failure of a good joint, and they were brought to a head, no doubt, just as much by vibration and driving stresses as by inflation pressure.

With quieter final drives by reason of helical bevels taking the place of straight bevels, one hears less frequent complaints against the disk wheel on account of its resonant effect. But, nevertheless, it is open to that criticism when indirect drives are in use—which is the case a considerable portion of the time in the small-engined cars.

An unquestionable advantage of the disk type is the ease with which the designer of the car can provide central pivot steering, the dishing of the wheels allowing the swivel axle pivots to be arranged vertical and central over the point of tire contact with the ground. Quite a number of new cars have this arrangement, which is undeniably of assistance in securing ease and precision in steering control. In one or two cases, however, the front wheels are still splayed slightly, despite the central pivot, which is, nevertheless, still kept vertical. But, as a rule, the wheels also are vertical.

Wire wheels are most used at the extreme ends of the scale of car sizes; on the largest and on the smallest. They are almost invariably detachable and in this connection Dunlop and Rudge have introduced detachable wire wheels held in place by bolts the same as pressed steel and disk wheels.

Despite the fact that Dunlop and a few other British tire makers have standardized a line of straight-side tires, the clincher pattern is still all but universal; only Beardmore on an 11-hp. chassis has adopted the alternative. This must be a disappointment to the importers of American straight-side tires, for they have made great efforts during the past 12 months to popularize this type by propaganda in the press and elsewhere. It follows from the foregoing that demountable rims are still foreign to British practice, the detachable wheel being used even on the Beardmore with the straight-side tires.

The cord tire is, however, assuming a certain degree of popularity, due mainly to its being supplied by Dunlop as an alternative to the fabric variety and to extensive propaganda and advertising of the Michelin "Cable" tires. Only few car makers have standardized it for next year, and those that have done so are using it instead of fitting a larger size of canvas tire to the wheels of chassis with sedan and other types of closed bodies. The 11.4-hp. Humber, for example, has 760 x 90 m.m. fabric tires on the open cars, and the same size in cords on the coupé and four-passenger sedan.

Dunlop having adopted the Schrader valve, the latter appeared on a large proportion of British cars for the first time—for Dunlop tires are standard with 90 per cent of British car makers.

## Self-Adjusting Connecting Rod Bolt

**A** CONNECTING rod bolt which automatically takes up wear in the bearing as fast as it occurs has been placed on the market by the V. & S. Automatic Bolt Co. The bolt is provided with an "Acme" left-hand thread for the revolving nut and a right-hand "V" thread on a smaller diameter at the end, for the spring-lock nut. The revolving

A self-adjusting connecting rod bolt

ing nut is provided with a chamfered face on the contact side (toward the cap of the connecting rod) and is sufficiently free on the bolt to offer slight resistance to rotation in taking up wear.

The force required for making the adjustment is derived from a spring, which is attached to the revolving nut and is of the barrel type. In a spring of this type the center coils are the weakest and do most of the work when only moderate tension is required. The revolving nut cannot back up.

The spring-lock nut is provided with four adjustment slots so that any desired spring tension may be obtained, and has a right-hand thread, which, with the spring tension pulling to the right, locks it on the bolt.

The installation is made by removing the engine underpan, exposing the connecting rod bearings and removing all caps and bolts. If shims are used they are removed; otherwise a space of at least 1/16 in. is provided between the cap and rod by filing that amount from the cap faces. This is necessary in order to permit the bolt to function properly.

The bolt holes in the cap are then reamed 0.005 in. larger than the bolt to be used, following which the underface of the lugs of the cap are end-milled sufficient to provide a space of 1/32 in. between the revolving nut and the spring lock nut. This prevents interference and undue splash and also provides a smooth surface for the revolving nut of the automatic bolt.

The preparations completed, the bolts are inserted in the rod, the caps placed in position, the revolving nuts attached by finger pressure only, and the spring lock nut is then placed on the end thread and tightened against the shoulder of the bolt by the small spanner wrench provided. The hook of the spring is then engaged in one of the four tightening or adjusting slots of the spring-lock nut by means of a small wire loop on the handle of the spanner wrench, and is brought to proper tension, which is determined by the "feel" as in fitting bearings by any of the other methods. It is said not to be necessary to burn or scrape in the bearing.

It is claimed that the use of these bolts insures better crank-pin bearing lubrication, as the space previously occupied by the shim now permits more oil to reach the bearing surfaces, and if the bearings are properly chamfered a valley is formed for the storage of oil.

# The Navy Racer Which Won the Pulitzer Trophy

Biplane which now holds the world's record for any closed course was designed and built complete, engine included, in the Curtiss plant. Many interesting engineering features incorporated in this all-American product.

By Herbert Chase

**T**HE Curtiss navy racer which recently won the Pulitzer Trophy at Omaha was designed and constructed complete in the plant of the Curtiss Engineering Corporation. We are informed that the machine was conceived about June 1, 1921, that one machine was completed and ready to fly about August 1, and a second on August 8. When it was finally decided that the navy would not enter a plane in the Pulitzer race the Curtiss company secured permission (about ten days before the race) to enter one of these machines. It was flown in the race by Bert Acosta and covered the 153.59-mile, five-lap triangular course, including 14 turns, in the time of 52 minutes 9 seconds, or at the rate of 176.7 m.p.h. This constitutes a world's record for competition over a closed course and is officially recognized as such by the Aero Club of America. The previous record for the same trophy was won by a Ver-ville-Packard about a year ago, when the course was covered at an average speed of 156.5 m.p.h.\* We are informed that the previous record for closed course competition was made in France in October of this year, when a Nieuport-Delage monoplane made an average speed of 173 m.p.h.

The Curtiss navy racer was designed primarily as a racing machine, to be used in part as a means of testing the new Curtiss C. D.-12 engine, but the design is such that the machine can, with slight modifications, be arranged for mounting a machine gun, and thus be suited for use as a high-speed pursuit plane.

There is nothing radically new in the design of the plane, but it incorporates a number of refinements and is, of course, arranged to minimize head resistance. The wires are all of streamline form and all exterior fittings have streamline coverings. This applies even to the radiator piping, which in the accompanying cut is shown exposed. The cockpit opening has also been made smaller

than shown in the cut. The Lamblin radiators shown are the only parts not made in this country, and these may later be abandoned in favor of a wing-type radiator now under development by the Curtiss company. All the major units of the plane, including the engine, are made in the Curtiss plant.

Most of the wing covering is of  $\frac{1}{8}$ -in., two-ply veneer, which is used as a structural member, though the trailing edge of the upper wing is covered with linen. The total wing area is 168 sq. ft. and the wing loading, based

on a gross weight of 2165 lb., is slightly under 13 lb. per square foot. A Sloane wing section is employed.

The plane weighs 1735 lb., light, and has a useful load of 430 lb. It is said to be capable of speeds in excess of 190 m.p.h. on a straightaway and to have a landing speed of about 70 m.p.h. The overall span is 22 ft. 8 in.; length, 21 ft.  $\frac{1}{2}$

The Curtiss Navy Racer which won the recent Pulitzer Trophy race at Omaha, covering the five laps of the 153.59 mile triangular course at an average speed of 176.7 m.p.h.

in.; height, 8 ft. 11 in.

The engine is of the twelve-cylinder, 60-deg. V-type,  $4\frac{1}{2} \times 6$  in. (1144.8 cu. in.), and is said to develop 405 b.h.p. at a normal speed of 2000 r.p.m. The propeller is mounted on the crankshaft. The engine cylinders are made as short as possible in order to facilitate good cowling. It will be noted that the fuselage has an excellent streamline form, in spite of the high-powered engine employed. The overall dimensions of the engine are: Width,  $28\frac{1}{4}$  in.; length,  $56\frac{1}{4}$  in.; height,  $34\frac{1}{2}$  in.

The engine is similar in general design to the Curtiss model K-12, described in AUTOMOTIVE INDUSTRIES for May 15, 1919, but incorporates the changes made in model C-6, described in the issue of July 29, 1920, and some additional changes. It will be recalled that the crankshaft is of the seven-bearing type, but the front bearing is made in two parts with provision for a large ball thrust bearing between the two, so that there are in reality eight main bearings. These are all 3 in. in diameter instead of  $2\frac{3}{4}$  in., as formerly. All bearings are now of the bronze-backed type.

The lubricating system remains unchanged in princi-

\*Last year's record was announced at the time as having been won at an average speed of 173 m.p.h. When the course was later surveyed it was found to be considerably shorter than originally figured, and the speeds announced correspondingly slower.

The Curtiss model C.D.-12, twelve-cylinder engine used in the Navy racer. It weighs 700 lb. dry, and develops 405 hp. at 2000 r.p.m.

ple. It is, of course, of the pressure type with direct feed to all main bearings. The crankshaft is bored out to make it light, but formerly the ends of the hollow main journals were left open and oil was conveyed to the crankpins by inserted pipes which registered with the oil duct in the main bearing at each revolution. The journal ends are now plugged and are run full of oil. Provision is now made for connecting an oil cooler when desired.

Ignition is furnished by two twelve-cylinder Berkshire

magnetos, each of which fires a separate set of A. C. plugs, there being two plugs for each engine cylinder.

The engine used in the race was fitted with two Ball & Ball duplex carbureters. These are located well down in the V, but with the air inlets carried outside the cowl above the engine. Fuel is fed to the carbureters by a two-cylinder opposed plunger pump driven from the distribution gearing. The plungers are operated by a cam and Scotch yoke inclosed in a case which is kept filled with lubricating oil under pressure. Since the oil pressure is always greater than that on the fuel, no leakage of gasoline into the oil can occur, but slight amounts of oil can mix with the fuel.

The engine has a 6.1 to 1 compression ratio and consequently requires special non-detonating fuel. The fuel used in the race was aviation gasoline and benzol mixed in equal proportions. The engine is said to consume 0.50 lb. fuel and 0.008 lb. oil per b.h.p.hr. and to weigh 700 lb. dry, or 1.73 lb. per b.h.p.

The general specifications of the Curtiss navy racer are as follows:

#### Areas (in sq. ft.)

Upper wing panel .....	88.0
Lower wing panels without ailerons.....	80.0
Total wing area .....	168.0
Ailerons .....	18.0
Horizontal stabilizer (2).....	12.6
Elevator (2).....	9.2
Tail fin (1).....	4.8
Rudder (1).....	4.8

#### Dimensions

Span (overall) .....	22 ft. 8 in.
Length .....	21 ft. ½ in.
Height .....	8 ft. 11 in.
Length upper panel .....	22 ft. 8 in.
Length each lower panel .....	10 ft. 2¼ in.
Chord (all wings) .....	48 in.
Angle of incidence .....	0 deg.
Gap .....	48 in.
Stagger .....	15 in.
Dihedral (lower only) .....	2 deg.
Sweepback .....	None
Tread of wheels .....	60 in.

## A New Model Governor

A NEW model Monarch governor operating on the same principle as the previous model has been brought out by the Monarch Governor Co. The Monarch governor utilizes the kinetic energy of the moving gas in the intake manifold to operate the automatic throttling mechanism. It has only two moving parts and is completely automatic. Referring to the cross-section herewith, the governor comprises a coiled spring 1, with a rocker arm 2, and conoid 3, butterfly 4, and cone 5. The spring is so proportioned as to make possible a wide range of governed engine speeds. Adjustment is secured by removing the cap at the bottom of the spring housing and turning the slotted screw provided for this purpose. The rocker arm is provided at both ends with hardened ball point bearings that oscillate in hardened steel cups. It is fitted with an oil-and-wick lubricated bronze bushing.

The conoid or governing member 3, in conjunction with the cone 5, controls the governor action. Normally it is held wide open by the spring, the spring action on it being balanced by the pressure upon it due to the flow of charge from the carburetor to the engine. Any increase in velocity overcomes the resistance of the spring and causes the conoid to rise in the cone and close the butterfly.

While the principle is the same as that of the old model, there is no resemblance between the two in construction.

Probably the chief advantage of the new model as compared to the old is that the spring tension or opposing force is now applied through the conoid instead of through the butterfly. This reduces the stress on the bearing surfaces and should result in a correspondingly longer life.

Sectional view of new Monarch governor

# Some Unique Facilities for Crankcase Production

Continental Motors Corporation has recently retooled its plants with specially designed machines for the rapid and economical production of aluminum crankcases. One four-way multiple-spindle drill is arranged to bore 84 holes in a single operation requiring one minute to complete.

By J. Edward Schipper

**T**HE Continental Motors Corp. has extensively retooled both its Detroit and Muskegon factories.

This concern is now using some advanced special machinery for the manufacture of its line of engines, many of the tools and special machines being fixed-purpose types and non-adjustable to any degree, indicating the intention of the company to continue its present products on a quantity basis.

New buildings and improved machinery and tool equipment to the extent of several million dollars have been added to the Continental factories during the past several months, in spite of the general depression. The Muskegon plant, which is laid out to specialize in four-cylinder engines, has doubled in floor space, manufacturing equipment and capacity during this time. The new machinery and tools are intended to insure high standards of quality, uniformity and interchangeability. Perhaps no single department illustrates to better advantage the interesting possibilities of this new equipment than the crankcase division.

In this department there is equipment now being used which not more than 12 months ago manufacturing experts insisted could not be produced. This includes multiple-spindle tapping, automatic four-way drilling, rough and finish milling as many as twelve different surfaces at one time in the same continuously operating machine, and other equipment of equal interest.

The result of these improved practices is a marked advance in the possibilities of machining uniformity, high standards of accuracy and the maintenance of close manufacturing limits. For instance, one four-way, multiple-spindle drilling machine now does the same work as was done on five multiple-spindle machines. In fact, the railway type of installation perfected and used so successfully by Continental was described in *AUTOMOTIVE INDUSTRIES* at that time and was pointed out as being an extremely important development in crankcase manufacture. There were five machines along the line of railway and a jig traveled from one to the other on a track. This was a rotating, indexing type of jig, which permitted very rapid passing of the work from one multiple-spindle machine to the next. The new four-way, multiple-spindle machines perform 84 drilling operations at one time.

Another type of specialized equipment taps 56 holes simultaneously. Car and truck manufacturers who follow the progress of the industry will realize that this is a rather advanced step in aluminum crankcase manufacture. Two skilled operators can put a crankcase through the drilling operation along the railway system in three minutes, which is the actual capacity of the

system, as there is no lost motion in passing work from one machine to the next. With the 84-spindle machine, one crankcase is drilled each minute with practically no manual effort on the part of the operator.

Crankcases are received in the form of aluminum castings with the steel oil tubes cast directly in the case. The steel oil tubes include a main oil lead and branch leads which run to each of the main bearings. This tube assembly or galley line is brazed together and then cast into the crankcase. The crankcase castings are, of course, sand castings, but are made from special metal patterns which are adapted to working with automatic molding machines and which insure castings having a uniform thickness of metal walls. The construction of the patterns, as well as the special molding machines, is such as to permit exceptionally close limits for foundry work. The cases are splendid examples of up-to-date foundry practice.

The crankcases are inspected on an inspection fixture, Fig. 1, to determine whether there is sufficient metal on all surfaces where machine work is to be done. One crankcase out of each foundry run is passed into a special inspection room, where it is carefully gone over and scribed off in detail to see that it accords with the dimensional limits established.

After inspection the crankcases are sprayed on the inside with a special solution known as enamel filler. This finely atomized spray thoroughly permeates the metal and takes on a sort of celluloid texture (after it hardens) which permanently seals the pores of the metal. The first actual machining operation is accomplished on a new type machine, Figs. 2 and 3, which is equipped with four roughing cutters and three finish cutters. Six cases are accommodated at one time on the reciprocating table, which has a quick return movement. The fixtures into which the crankcases are fitted are equipped with shims for leveling the case properly to take this initial cut. The machine rough and finish faces six different surfaces at one time.

The importance which Continental places upon the proper installation of the crankshaft is here plainly evident, as in this initial operation the first step is taken to assure the horizontal center line of the crankshaft being parallel with the upper and lower surfaces of the crankcase. An interesting feature in connection with the initial milling operation is that there are spring plungers beneath the projecting flanges of the case to stiffen them against the pressure of the cutters. As a result, smoother and more perfect machined surfaces are consistently maintained than would be possible with a less rigid support.

1—Gaging the raw crankcase casting for 7-R Continental engine before starting its manufacture. 2—Ingersoll continuous miller which takes four rough cuts and three finish cuts. This mills the main bearing surfaces and rough mills and finish mills the oil pan bolting flange which acts as a master locating surface in all subsequent operations. 3—Showing the finish cutting side of the same Ingersoll miller as illustrated in Fig. 2. 4—Milling the cylinder attaching surface on an Ingersoll miller and straddle milling endwise the 7-R Continental crankcase. 5—Straddle milling the main bearings on the 7-R crankcase in a No. 4 Cincinnati miller. The machine is shown above and a milled case below. 6—Drilling 15 holes for the crankshaft main bearing caps, distributor drive hole, oil slinger plate screws on a Foote-Burt multiple spindle drill

7—Four-way automatic Foote-Burt multiple spindle drill which drills eighty-four holes a minute in the 7-R crankcase. This is a non-adjustable tool solely designed for work on this case. It drills the four ways simultaneously. 8—A Foote-Burt multiple tapping machine which taps fourteen holes at once, taking care of the main bearing cap screw holes and others. 9—A three-way multiple tapper which taps fifty-six holes simultaneously. It was not long ago that a tool of this kind would have been considered an impossibility. 10—Cutting ten bearing surfaces for the crankshaft, camshaft, idler gears and water pump shaft simultaneously on a machine designed in the Continental plant. 11—Flycutting the bearing surfaces on the 7-R crankcase with a Continental designed machine. 12—Taking the light finish cut from the cylinder bolting surface of the 7-R crankcase. The location is by spindles which enter the end main bearings, giving proper distance from center line of crankshaft to finished middle surface

In noting the operation on crankcases it is an interesting as well as significant fact that the machining divisions are departmentized under three main heads, so that specialists are at all times safeguarding the quality of the finished product. There are the operators who actually supervise the machining operations. There are the expert machine setters who are held responsible for the accuracy of the work. They are the men who set up the machines for the work and who maintain their cutting accuracy. The operators do not do their own setting. They are only responsible for getting the work through the machines which have been set for them by the men who specialize in this important work. The third department is that of maintenance, which is solely concerned with the upkeep of the machinery.

The large output of the Continental plants makes it possible to especially design and adapt each machine to but one definite operation, and to maintain the functioning of each machine continuously day after day on the one kind of work. This permits of commercially maintaining exceptional machining accuracy and accounts for the close limits on Continental blue-prints, which would otherwise be impossible in quantity.

One of the next interesting machining operations, Fig. 4, is milling the cylinder attaching surface and both ends of the case. There are four cutters on this machine, two above, which take care of the upper surface to which the cylinder block attaches, and two side cutters, which straddle the entire length of the crankcase and machine it to its proper limits. The fact that the crankcases are handled in this way is very important in assuring interchangeability. The type of multiple-tooth cutters used and the cutting speed selected is such as to make possible true and uniformly machined surfaces. All cutters are designed and built by Continental.

Straddle milling is also used for the crankshaft main bearings. A miller adapted to this work, Fig. 5, with nine cutters takes care of all main bearings and also the oil slinger groove at the rear of the rear main bearing. Location is from the master locating surface and special locating gages. This method of location need not be repeated for each operation, as in every case the jig or fixture is so designed that the crankcase can be fitted against the master surface and accurately located by the gages provided for that purpose.

Fourteen holes for the crankshaft main bearing caps, as well as for the oil slinger plate, are bored simultaneously on a special non-adjustable, multiple-spindle drill, Fig. 6. The fixture used in this case is a box type. The simplicity of the fixture, the method of automatically locating the case against the master surface by a movement of the foot and the few seconds required to make the set-up are particularly interesting. The capacity of this machine drill is one case per minute.

#### Four-Way Multiple-Spindle Drilling

Following the crankshaft bearing cap seat drilling is the operation on the large, automatic, four-way drilling equipment which has been mentioned. These machines, operating with a closed box jig, drill four ways simultaneously, Fig. 7. The 84 holes are drilled in one minute. In the ordinary engine manufacturing shop anywhere from three to twelve multiple-spindle drills are required to perform the operation that this type of machine takes care of simultaneously.

It is equipment of this kind which can be used only where there is production of a standardized product in sufficient quantity necessary to warrant such an installation. It also is equipment of this kind which establishes accuracy and interchangeability. Each machine of this type is designed and built especially and exclu-

sively for machining one particular type of crankcase.

All of the fourteen holes in the main bearing seats are tapped simultaneously on machines very similar to the type which performs the drilling operation, Fig. 8, and another type of three-way tapper, Fig. 9, takes care of 56 other holes. In this machine the case is inserted sidewise on end into the box fixture and the device which holds the master surface against the jig acts sidewise. Machines of this kind until just recently were considered impossible, but the phenomenal progress made in the science of specialized machines for engine building easily takes care of 56 tapped holes per minute.

#### Ten Bearing Surfaces Bored Simultaneously

After the bearing caps are put into place the ten bearing surfaces for the crankshaft, camshaft, idler-shaft and water pump driveshaft are bored simultaneously on special machines designed and built by Continental, Fig. 10. These give a rough and finish cut to the bearing surfaces. After a thorough cleansing, followed by an inspection, the main oil header is tested under pressure to see that there are no oil leaks. A finish reaming operation is given all the bearing seats in the crankcase to be sure that the bronze back bushings will seat perfectly. The bushings are then inserted and secured by brass screw dowels with countersunk heads. The bushings are pressed into place on a new type machine which has but recently been perfected. In these machines the bushings are protected while being pressed in place. Such improved equipment lines the bushings up with their seats so that the bushings are seated perfectly, maintained in correct alignment and held to their true diameters.

The babbitt-lined, bronze-backed bushings are flycut to size, Fig. 11, on machines which not only take care of the main bearings, but also take the finish cut from the camshaft bushings, idler gearshaft bushing and water pump driveshaft bushing.

A very light finish cut is taken off the cylinder bolting surface of the crankcase. The machines on which this operation is performed, Fig. 12, are designed and equipped to assure the utmost accuracy in the location of this surface with respect to the crankshaft and particularly to insure its being parallel with the horizontal center line of the shaft. The cases are then washed and all bushings line-reamed, after which the crankcases are ready for the crankshaft.

To assure alignment there is an interesting final operation. This is a flycut on the flywheel housing. The operation is performed after the engine is completely assembled and belted in. The cutting tool is attached to the flywheel and is driven through the crankshaft of the engine. This trues up the transmission bolting flange so that it is perfect with respect to the center line of the crankshaft and so that its bolting surface is at a true right angle with the shaft. This is an important factor in securing good operation of clutches.

In following the work through and recording its progress a pad of tickets is attached to the case when it starts through the manufacturing processes. As each man finishes his work he tears off one of these tickets, which gives the part number and the division which is taking care of the work; that is, such as crankcase machining, crankcase assembly, etc. The operation number is then given, the name of the department and the number of the case. A glance at the ticket at any time gives the condition of the case as regards manufacture and shows the operations which are still necessary to complete the work. The last ticket is removed in the final inspection department, after the crankcase has undergone a detailed and thorough examination.

# Car Owner Is Boss of Automobile Industry

A candid critical analysis of the service problems of the industry is contained in the following statements of Norval A. Hawkins. This paper should have the careful attention of every executive in the industry. It is the most important service pronouncement that has yet been presented.

By Norval A. Hawkins\*

**I** THINK we would all do well right at this time to hark back to basic fundamentals, forgetting the frills, red tape and intricacies of our Twentieth Century organizations, and ask ourselves the question, "For whom do we really work?"

It is not the sales manager nor the general manager nor the board of directors nor even the stockholders. The man to whom we really owe our jobs, individually and collectively, figure it any way you like, is none other than Mr. Retail Customer—Mr. Car Owner—the ultimate consumer. It is none other than he who pays us our salaries and tells us whether we shall run full time, double time, half time, or not at all.

It is he who is meeting our annual payroll to the tune of one billion forty-two million dollars and it is upon him that we must depend for the future security of our entire industry.

The automobile business must be reduced to sound fundamentals. We are entering into a new era. We've got to forget some of our past tactics. As our Mr. Charles F. Kettering recently expressed it—"the whole scheme of things has been reversed. We are out trying to buy the customer's dollars—our currency is in the form of gears, cylinders, pistons and axles—the exchange must be mutually advantageous—both sides must benefit—honesty must be the basis of all transactions. If the customer tries to pass off a counterfeit dollar on us, we refuse to take it—and by the same token, if we attempt to give him a counterfeit gear, or a defective axle, he has an equal right to become incensed."

In the new scheme of things we must put up a stiff fight for every bit of the business that we get and service to this Mr. Consumer is the cornerstone upon which the future progress of our entire industry will rest.

When such a mechanical product as an automobile is sold, service is a necessary corollary to sales and advertising. One of the fundamental principles of management, therefore, is that service, sales and advertising are essentially interrelated and must be governed by the same general policy if perfect co-ordination is to be effected.

\*Advisory staff of General Motors Corporation. Abstract from a paper presented before N. A. C. C. Service Managers' Convention.

Service is not a matter of minor concern, to be considered after the purchase of a car, as a mere incident. It is of major importance. Properly co-ordinated with selling and advertising, the service policies of any company, when a system of service is made effective, will be the most powerful means of building up its business.

Service is a matter of major importance, deserving of the greatest executive consideration. All of us should be directly concerned with the establishment and use of basic principles of perfect service to every car user, irrespective of the make of car that he drives.

We must be unselfish about this thing. We can best help ourselves by helping one another. No one manufacturer can ever hope to have enough service stations to care for each and every one of his vehicles irrespective of where they may happen to be. The owner, at some time or another, is at the mercy of an independent garage or a dealer who has a competitive interest. It is only through co-

operation that we may adequately serve the owner.

Experience has developed all the right principles of service. It remains only for us to put these principles into effect by applying them to our own specific products and co-operating one with another.

There are five causes and only five causes of service cost to the producer, or the car owner, or both. They are as follows:

- 1st—Faulty engineering design.
- 2nd—Faulty production, including careless workmanship, faulty material, or both.
- 3rd—Incompetence on part of service repair men.
- 4th—Incompetence on the part of the user.
- 5th—The wear and tear of normal use.

The first, second and third causes for service expense are directly within the control of the manufacturer, and we as service managers should make it our business to take some interest in the fifth cause.

Service should properly begin with the design of the car—in fact it should begin with the very conception of a product and it should be projected through the engineering, manufacturing and marketing process, assum-

ing an ever increasing importance after the product is in the hands of the user and until the time that it is ready for the discard through legitimate and honest wear—after having given an adequate return on the customer's investment.

If the maximum value to the user with the minimum service cost to the manufacturer is to be attained, then the future changes in our products must be in the direction of eliminating needless varieties in design and toward the selection of the best types of construction.

The elimination of needless variety is necessary to reduction of both production costs and service costs for two reasons, to wit:

1st—Quality of workmanship and material are more easily maintained as the variations in mechanical practice are decreased, and

2nd—Because incompetence of the service workman can be more effectively reduced as the variations in mechanical practice decrease.

It necessarily follows that future changes in automotive products should not only lead toward the elimination of needless variety, but the maintenance of the needed variety and the correct use of these variances with respect to more intelligent marketing policies.

I wonder just how much thought your engineering departments are giving to this question of service. I'll tell you some of the things that we are beginning to do in the General Motors Corporation.

First of all, in the future, no new model will ever get into production until it has been subjected to the most gruelling scientific tests that we are able to devise. I don't refer to block tests and cross country advertising tours either. I mean that a proposed model must be subjected to service equivalent to what it would get from the most careless user during the normal life of the car, keeping an accurate "log" of wear, breakage, etc., in order that we may in our service manuals give the dealer and owner specific, accurate and dependable information regarding the upkeep, repairs and replacements. Also, that we may give the dealer, right from the start, accurate data regarding the replacement parts that he should carry in stock.

And this is not all. Before we go into production on any new model, such a model must be carefully analyzed from a mechanical service standpoint. The design will not stop with the completion of the layouts and detail drawings covering the parts of the car itself, nor even with the design of production tools for its manufacture. Before any such job goes into production in any of our factories in the future, no less than five sets of tools must be designed, as follows:

1st—Jigs and fixtures for factory production.

2nd—Repair tools and fixtures for service shops at branches and large distributors.

3rd—Repair tools and fixtures for large dealers.

4th—Repair tools and fixtures for small dealers and sub-dealers.

5th—Hand tools for the owner designed especially for the particular car and adequate for such minor repairs and adjustments as may be entrusted to him.

In other words, when the owner finds something wrong on his car and he has no tool for repairing it he knows that it is time for him to visit his dealer and when the dealer has a job of overhauling for which his class of equipment is inadequate, he will in turn refer such work to the nearest distributor or branch with whom he will have a standard working arrangement covered by the terms of his contract.

The same plan will apply to service manuals and each of the five groups will be supplied with accurate and specific detailed instructions for doing the work entrusted to it.

The service man is essentially a salesman—in fact he must be a super-salesman. The new car salesman, generally speaking, sells the customer only one time. The service salesman, on the other hand, must keep the man sold by reselling him time and time again throughout the life of the car.

And remember this—the customer is invariably in the best of spirits when he negotiates with the new car salesman, but his transactions with the service salesman are usually under the most exasperating conditions.

The success of a company is primarily dependent upon the adequacy of its sales and service. There must, in the future, be a more equitable working arrangement between these two most important phases of the industry.

The salesman must work in closer co-operation with the service department. When the owner has trouble he calls on the service man to remedy it—not the salesman. Therefore, the service department should have something to say regarding the claims and promises of the ultra-enthusiastic salesman.

When a salesman resorts to untruths or to promises which he knows cannot be fulfilled it is an admission that he is lacking in real sales ability.

Motor cars, in the future, are going to be sold from the back door rather than from the sales floors and across mahogany tables. Those of us who expect to survive keen competition in a permanent buyers' market must get our "house in order."

Inasmuch as we started this discussion from the consumer end, let us next consider the dealer and the garageman and in this connection let me say that we must stop trying to "pass the buck" to the retail service organization.

While it is generally conceded that such institutions are not efficiently operated, they are not so much to blame as are we who have failed to educate our retail representatives in the proper methods of doing business.

If the retail service station has been inefficient, it is we who are to blame. There is a total of 45,135 automobile repair shops in the United States. It stands to reason that the individuals operating these repair shops do not have the same opportunities to develop proper methods of servicing our products as do we with our elaborate organizations and service specialists.

We must begin to take greater advantage of our facilities and give our dealers the advantage of our best experience.

Let us remember that while these service and repair stations are for the most part operated by individuals not directly on our factory payrolls, they nevertheless work for the same boss that we do, namely—Mr. Car Owner. These independent garages and service shops are not independent after all—they are absolutely dependent upon our product and upon the good will of the public. Many of them are our own dealers operating under contracts which carry mutual advantages.

The most valuable asset of any automotive manufacturing organization is its territorial market. There is a limit to this territorial market. From a standpoint of area, it cannot be increased. A dealer's contract allows him to work a definite part of this territory.

Service, in terms of our industry, divides itself into three classifications:

- 1—Parts manufacture and distribution.
- 2—Mechanical repair work.
- 3—Moral or psychological service.

In all three classifications, we need greater efficiency. And when I say efficiency, I don't mean "red tape" and system for the sake of system. When you come right down to brass tacks, there is only one definition of this word "efficiency" and it may be expressed in these two words, "Responsibility Met." We who have to do with service must meet our responsibility by seeing to it that our dealers carry adequate parts to serve our customers.

We must also develop scientific methods for anticipating repair parts requirements—both between the dealer and the factory service department and between the factory service department and the production department.

Before we can get our dealers to follow our methods, we've got to actually show these dealers how they can make a profit.

The reason that many dealers have failed to make a profit on their parts business is because we fellows back at the factories have **guessed** at what they needed rather than making it our business to **know** what they were going to require. The result has been reflected in great volumes of telegraphic orders, express shipments and unnecessary expense to the car owner.

Within our own organization we found through a careful analysis that from 20 to 35 per cent of all repair parts orders during the first six months of 1921, were telegraphic and that almost 50 per cent of our parts shipments were going forward by express or parcel post as rush orders with a consequent high percentage of errors.

Nor is it sufficient that we merely get them there, we must get them there in a usable condition and see to it that the dealer keeps them in a usable condition.

Before we can instruct the dealer on this, we must begin practising it ourselves. I was in one of our largest factory service departments not long ago and the gaskets for the cylinder heads and crankcases looked as though they had been put in the bins with either a pitchfork or an air conveyor. I was in another plant where we found that the connecting rods after having been aligned and inspected were thrown in a big box with several thousand others, with the natural result that the rods in the bottom of the box were bent out of shape.

In still another factory, delicate electrical parts were being handled and stored as though they were made of pig iron.

Safeguarding the quality and condition of repair parts is of vital importance to our industry. Unnecessary handling is both wasteful and expensive. With the proper development of a unit system, for packing, the repeated handling, counting and checking of repair parts with the damage and waste incident thereto can be eliminated.

Scientific anticipation of repair parts requirements and the distribution of parts on a wholesale basis are necessarily the forerunners of an efficient unit package system and we've all got to come to it.

We have no right to penalize our customers for our own inefficiencies incident to the repeated physical handling of our repair parts. We have not discharged our obligations to the car owner. We have not met our responsibility until we get these parts to him in the right condition and at the right price.

Although the war is over and the price of materials and labor has settled down to a more or less stable level, we are still asking the owner to pay us exorbitant prices for parts necessary to the maintenance of his car.

The completed motor vehicle is designed and built to meet a certain market price, but repair parts for this same vehicle are manufactured on a cost plus basis and any loose ends of operating costs are thrown into the bargain.

We recently made an investigation on a number of cars of representative makes to determine the relation between aggregate repair parts prices and the list prices of the finished products. The ratio ran from one and one-half to two.

Why should it be necessary to get twice as much for a disassembled car as you get for an assembled car? The complete car has a great deal more mechanical labor chargeable to it. There is always an unavoidable breakage of material incidental to the assembly process. It is supposed to require a more expensive type of salesman to sell a finished car and it is usually necessary to demonstrate it before consummating the sale.

And again most of us are still adhering to the unbusinesslike wartime practice of omitting our repair parts prices from our parts catalog.

It surprises me to learn that a number of companies have even discontinued the practice of supplying owners with parts catalogs.

We of the automobile fraternity do not hesitate to spend \$7,500 in the big weekly to call our product to the attention of the buyer and if Mr. Buyer answers the ad we send him 18 form letters, six

folders, a dollar and a half catalog and a liveried chauffeur to take him for a ride in the park—then after he buys the car we refuse point blank to give him a parts catalog and some of us even go so far as to attempt to charge him for it.

The present day dealer, in striking contrast—submerged in a multiplicity of models conspicuously free from any and all interchangeability of parts—is in the predicament of having entirely too many parts catalogs. He finds it necessary to refer to a veritable "5-ft. shelf" of voluminous literature to ferret out the various serial numbers, parts numbers, pattern numbers, model numbers, car numbers, motor numbers, code designations, historical data references, alphabetical prefixes, differential discounts and war tax schedules, before he becomes a party to the secret of just how much **too much** he is going to have to pay for the blame thing!

And even this isn't the worst of it for the dealer immediately goes us one better and begins to tack on extra charges covering freight, express, telegrams, handling, overhead and wear and tear on his nervous system.

I am in favor of lower prices and uniform prices on repair parts, but please don't misunderstand me. I am not at all in sympathy with those of you who do not think that a service department should be conducted for a profit and if you want to earn the status with your respective organizations to which you are entitled, if you want to be looked upon as producers instead of parasites—if you want to be business executives instead of clerks—you've got to look at it just as I do. If you are ambitious for recognition in an executive way, you **MUST** be able to show your results on the right side of the ledger.

---

**E**FFICIENT service is the most effective insurance to take out on the future prosperity of the automotive manufacturer. Service is being weighed in the balance and found wanting. Haphazard methods cannot survive and the manufacturer must teach the dealer how to conduct his service at a profit and at the same time reduce the costs to the car owner. The good will of the latter gentleman will insure profits.

---

Of course there are two kinds of profits accruing from service: 1st, the direct dollars and cents profit as it appears on the balance sheet; 2nd, the indirect and intangible profit accruing from the good will of a customer properly served, which is in turn reflected in the sale of new cars.

It is my contention that these two profits are entirely compatible in any manufacturing institution which has an economic reason for its existence.

Do you issue regular reports covering such items in order that your organization may get a true reflection as to the quality of the product? Do you know how much such replacements are costing you per automobile?

What is being done about it? Is the cost decreasing or increasing? What department is being charged with these costs?

Unless you are thinking in terms of profits and disseminating data of this kind among the proper departments of your organization, you have not met your responsibility—you are not doing your duty as service managers.

If the production has too much material of a certain kind, they try to pass the buck by turning it over to you service men, whether you need it or not. Let me say right here, that if you thought more about profits and turnovers you would not stand for this sort of thing three seconds!

We have just inaugurated a policy within General Motors, handed down from the president through the executive committee, that provides for service parts requirements being given precedence over production requirements, first, last and always—irrespective of the new car orders on file—and without consideration for any temporary financial loss.

We have arrived at the very sound conclusion that keeping the old cars running is of far greater and more lasting importance than the matter of getting the new cars sold.

The old car owner must be given first consideration if we expect to get new car owners. The repair parts phase of the industry must be conducted for profits but these profits must come through greater efficiencies all along the line rather than by the maintenance of prohibitive repair parts prices.

\* \* \*

Efficient mechanical service on the part of the dealer is of prime importance. It is not enough that he be able to just "fix" a car so that it will run—he should possess the knowledge and facilities for turning out work that would pass the most rigid factory inspection. He should have equipment proportionate to his service requirements. He should have special tools for those operations peculiar to the particular car that he represents, unless he is a very small dealer, in which case he should have a working arrangement with his distributor on overhaul jobs which he is not prepared to handle.

Here again the responsibility rests with the manufacturer.

It is the business of the factory service manager to develop or to have developed special tools and service fixtures for the use of the dealer and distributor and to see to it that such equipment is properly used.

The dealer must be shown how to lay out his shop properly. The stationary equipment should be located with a view to increased efficiency and the hand tools should be kept in special tool racks where they may be readily located instead of thrown helter-skelter around the shop. The owner must not be penalized for inexcusable lack of efficiency.

If the service manager does his duty in this direction,

repair work will gravitate to our regular dealers instead of to the back alley garage.

It is my prediction that within three years every reputable repair shop in America will be operating on some form of flat rate system. Whether we like it or not, we've got to come to it and when we do come to it we'll be surprised at just how low our past efficiency has been.

\* \* \*

In our factories we know just how long it takes to do a specific operation, and the exact cost of the material and labor involved, whereas, on the other hand, our service stations refuse point blank to tell a man what a repair job is going to cost him; as a matter of fact, they seldom charge any two people the same amount for doing the same job.

To me the necessity for standardizing repair operations is so obvious and so simple of accomplishment that it makes me mad when I hear a service manager say that it is impractical in connection with his particular product.

I'd like someone here to tell me the difference between putting on a steering knuckle in a factory and in a service station in so far as the problem of cost analysis is concerned.

And next we come to our third classification of service, namely, **moral or psychological service.**

In the future, we are going to see this thing that I choose to call moral service assume an ever increasing importance.

It will project itself through every phase of our service activity. Our boss, the car owner, is already demanding it, he has been meek and long suffering but his patience is just about exhausted.

Take the matter of keeping cars clean in a repair shop. A man may bring his car into your service station ever so dirty but this does not license you to turn it back to him in a still more untidy condition.

If I sent a coat to a tailor shop to have a button put on or a rip sewed up and the tailor spilled a can of machine oil on it or let his dog use it for a bed I would raise the dickens and so would you and yet every day cars are being turned out of our "authorized service" stations so greasy and mussy that after you've ridden around the next block you're a fit candidate for a Turkish bath.

Even our finest closed jobs are not immune—in fact, the average mechanic seems to fairly revel in the joys of disseminating grease and oil on a broadcloth interior—he may miss the universal joints, the transmission and the differential but the front cushion and the steering wheel—**N-E-V-E-R!**

Sales psychology must be projected into service.

To be successful, a service station must be conducted with a proper observance of the fundamental rules of psychology, common sense and decent business practices.

A strict observance of office hours should be taboo in any automobile repair shop. The biggest volume of sales on minor repair parts and accessories is made and the greatest good will is built between 5.00 p. m. and 9.00 a. m., during the noon hour and on holidays.

I would also suggest that you check up the service departments of your own immediate organizations and when I say Service Departments, I mean far more than the routine activity between the four walls enclosing the employees for whom you are directly responsible.

You must consider every phase of activity connected with your institution before you can get a true perspective of the service end of your business.

The service manager should spend more time out in the territory studying the problems of the dealers and

assisting them in the development of more efficient and uniform methods.

Service is being weighed in the balance and it is found wanting. Haphazard methods cannot survive. Service will be reduced to a uniform science. We must teach the dealer how to conduct his service at a profit and at the same time reduce the costs to the car owner.

After we have developed the proper methods, it will then be our business to check up our dealers in order that the good will of the car owner and hence the future profits of the industry may be insured.

Generally speaking, service in the automotive industry has been handled in a careless and inefficient manner. In the majority of cases it has been looked upon as a necessary evil—a side issue, subordinate to the major activity of building and selling complete units. It has been developed—or rather it has “grown up” in a hit-and-miss sort of fashion and has never had a share of recognition and sympathy proportionate to its importance. Most of us have depended too much on the sales of new cars to new customers, through new and spectacular advertising schemes, with ever changing models marketed through a new crop of dealers each season.

As a product attains a wide distribution the prospective purchaser becomes more or less immune to our ad-

vertising and sales activity and more and more under the influence of his friends who have had experience with the product in question. Whether the product receives an endorsement or condemnation depends largely upon the efficiency of the service that has been and is being rendered.

Efficient service is the most effective insurance to take out on the future prosperity of the automotive manufacturer.

We must sell service first and motor vehicles second. No matter how perfect the design and workmanship of so intricate a product as a motor vehicle, it cannot and will not stand up and give a satisfactory account of itself unless it is kept in first class condition through systematic inspection, adjustment and parts replacements. And by the same token, even a second rate vehicle can be kept going beyond its normal life if it is properly serviced.

The automotive industry leads all others in the fields of scientific research, invention, engineering, processing and manufacturing. The efficiencies and economies exercised in our modern plants are the standards of the world, but the injection of similar standards and efficiencies into our marketing and servicing methods is yet to be accomplished—and remember that “He profits most who serves best.”

---

## Electric Cars in Bulgaria

**P**OSSIBILITIES for the use of electric cars in the Balkan States are outlined in a communication recently received by AUTOMOTIVE INDUSTRIES from a correspondent in Bulgaria. He states that the present high price of gasoline, combined with various other conditions, makes the electric passenger car or truck practical in those countries, and believes a good market could be found for them there.

The gasoline car is being used considerably in the Balkan States, but thus far no possibility of using the electric has been mentioned there. There are certain conditions which do not speak well for the use of electrics, such as indifferent roads and the lack of electrical plants equipped for recharging the batteries of cars. Despite these drawbacks, the correspondent is convinced that the electric car would prove successful.

Gasoline has increased in price since the war until it is almost beyond the reach of the average purchaser, while the price of electric energy has risen but 50 per cent. The difference in prices is due to the fact that gasoline is imported and the price depends largely upon the rate of exchange. Electric power is supplied by plants having water power turbines or else generating their power with Bulgarian coal. The lack of technical education among drivers might also tend to make operation of the electric cars somewhat easier. The water power resources in Bulgaria are extensive, and the required current for operating electrics could be supplied readily, for in many spots electric plants have sprung up, and but a slight adjustment of their equipment would be necessary to equip them with charging apparatus.

A regular electric transport service might possibly be developed in Bulgaria in the districts where water power is most plentiful. It is interesting to note that a good many Bulgarian forest projects, mining ventures and other undertakings cannot be developed until the transportation question is satisfactorily solved. Motor

trucks have thus far proved unsatisfactory in solving this problem on account of the high price of gasoline.

The electric taxicab and bus is also mentioned as a possibility in Bulgarian cities.

The greatest obstacle, apparently, is the roughness of the roads, and electric cars for use in the Balkans would of necessity be compelled to have their batteries shock-proof as far as possible.

---

## Several Changes Made in Cole Eight

(Continued from page 1004)

assembly is now mounted on a coil spring suspension to relieve the core of all strains and eliminate squeaks and rattles.

An adjustable tie-bar is now used between the radiator assembly and the dash of the body to keep these parts in line. This tie is an addition to the support formed by the center panel of the hood, which is bolted to the radiator shell and the body dash. The hood itself has been materially improved in that heavier gaged stock is now used and reinforcements have been made in the hinge construction. The hood fasteners are now adjustable as far as the spring tension is concerned.

The rear spare tire carrier has been provided with a bottom brace to add to its rigidity, and the windshield assembly on the open model now has stanchions supported in a bracket having a firm footing in the body structure. All of these changes increase the rigidity of the assembly and help do away with rattles.

---

**B**ECAUSE gasoline is very dear in France, trolley-buses are taking the place of the vehicles at present in use. Reductions in fares will immediately follow this economy.

# Problems Frankly Analyzed at Service Managers Convention

Factory service managers believe that parts prices must be reduced, that methods of handling and ordering parts should be more efficient, and that the service manager should be consulted more fully in regard to car design. General sentiment seemed favorable to adoption of the flat rate system.

**M**R. Car Owner is the boss of every man in the automobile business. This thought, voiced by Norval A. Hawkins in the opening address, dominated the entire convention of N. A. C. C. Service Managers which took place in New York on Nov. 15 and 16. Both the scheduled speakers and those who discussed the various problems brought up agreed that the success of a service policy is determined in the final analysis by whether or not it satisfies the car owner.

Many practical service problems were frankly discussed and the fundamentals underlying proper service were outlined. It was the general sentiment that parts prices should and must come down. A majority of those present agreed that price reductions in cars have not been reflected sufficiently in parts prices. One speaker stated that an analysis of a number of makes of cars showed that the total selling price of all the parts of the car as compared with the price of the assembled vehicle ranged from 1½ to 2 times as great. Others voiced the opinion privately that these figures were very conservative. Certain causes for this discrepancy in price were advanced, but the sentiment prevailed that no just cause existed for the extreme difference noticed in most cases.

The importance of service as a factor in selling was strongly emphasized. It was pointed out that service is now a matter of major importance, and Hawkins even went so far as to state that it is more important to keep the old cars running than to build new cars. He stated that "we have inaugurated a policy within General Motors, handed down from the president through the executive committee, that provides for service parts requirements being given precedence over production requirements, first, last and always—irrespective of the new car orders on file—and without consideration for any temporary financial loss."

## Educating the Dealer

The need for education of the dealer played a prominent part in the discussions. The manufacturer must take the lead in starting progressive service methods and plans and in aiding the dealer to carry them out, according to Percy E. Chamberlain, who gave the principal address at the second day's session. Chamberlain discussed the problems of the dealer in connection with service and made a strong plea for the flat rate system of making service charges. In discussing the necessity for the manufacturer taking the lead in dealer education, he said that such leadership could not be accomplished by "jazz" methods. It is essential that the traveling man sent out by the manufacturer be a real business man with a thorough knowledge of the fundamentals upon which service problems rest.

The danger of being hampered by tradition was strongly presented by Chamberlain. "Many of our service problems are simply practice," he said, and pointed out the way in which progressive methods were often difficult to establish simply because the habit of the past had been to "do it a certain way."

"We are through with the war—between service stations and car owners—and the industry wants to know what the peace terms are." With this statement as a basis, Chamberlain discussed the interest which he found throughout the country in service problems and indicated that a real movement was on foot to analyze these problems carefully and to solve them along fundamentally sound lines.

## Service in Design

The engineering department came in for discussion. One speaker started the ball rolling by saying that "one thing that will help service problems, the used car problem, the public, the manufacturer and the dealer is to start building automobiles a darn sight better—and to begin to pay more attention to service problems when the car is being designed."

Many of the service managers cited instances in which the engineering department failed to consider service problems sufficiently. Some believed that the engineer often tends to be temperamental about his design; to consider only theory and laboratory results even in the face of practical difficulties developed in the average car on the road.

It was generally agreed that the service department should be consulted more fully in the matter of design and that the engineering department should utilize to better advantage the experience of the service manager.

Along this line the matter of constantly changing models was discussed. The great service difficulties involved in frequent changes were pointed out, and the service managers seemed to believe that manufacturers should consider this point more than in the past when discussing new models.

The discussion on "What can be done to reduce the cost of parts to the owner?" failed to develop the constructive plans that might have been desired. Many reasons for high prices were given and the responsibility for their continuance was placed in many quarters. As regards a real remedy for the situation, however, it cannot be said that a great deal of new data was developed. Possibilities for increased efficiency in the ordering and handling of parts were pointed out, however, and the necessity for eliminating from service department charges certain extraneous items was indicated.

The flat rate system was discussed at length following

Chamberlain's talk. The general opinion of the meeting was favorable to its adoption, although certain difficulties in its use were pointed out in special cases. Those who have had experience with it, however, were strongly convinced of its benefits, with one exception. These benefits extended, not only to the car owner, but to the dealer and manufacturer as well.

The part of the manufacturer in the establishment and development of the flat rate system brought out several practical suggestions. It was agreed that the manufacturer can do a great deal to help the dealer in analyzing his costs, both labor, material and overhead.

The necessity for finishing efforts begun along this line was long emphasized. There was some fear expressed that manufacturers might start detailed dealer education plans of this kind, send out one or two booklets, and let it go at that.

Taken as a whole, the meeting developed a great deal of interesting discussion. While conclusions were not reached definitely in regard to any of the questions presented, certain well-defined trends appeared as indi-

cated previously. The sentiments expressed served to visualize definitely the constantly growing importance of service in the scheme of automobile marketing and to bring into relief some of the chief problems common to all companies, together with constructive thoughts as regards their solution.

Norval A. Hawkins of the Advisory Staff of the General Motors Corporation, in his address, "For Whom Do You Work?" outlined the present status, past and present difficulties, the factors involved, and methods of possible solution in regard to almost every phase of the service problem. Speaking candidly and frankly, he discussed the causes of service, the factors involved and the responsibility of the manufacturer in regard to each of those factors. He came out definitely in favor of the flat rate system, stating that "it is my prediction that within three years every reputable repair shop in America will be operating on some form of flat rate system."

The entire address was distinctly refreshing in its frankness, vigor and scope. It is reprinted on other pages of this issue.

## East Africa as a Market for Motor Vehicles

**A** REPORT, written by Colonel Franklin, Trade Commissioner, has been published by the British Department of Overseas Trade on the trade and commercial prospects of East Africa. This area comprises Uganda, Kenya, Tanganyika, Zanzibar and Pemba, totaling 751,600 square miles, and is larger than the States of Texas, California, Montana, New Mexico, and Illinois put together. The whole area is one of great potentialities. Its mineral wealth is great, and its fertile, terraced lands permit most tropical and temperate products to grow profusely. It is lack of transport facilities that prevents their exploitation.

East Africa claims the highest proportion of motors per white population in the world. At the same time, Kenya and Tanganyika are practically destitute of good roads. Pemba, a huge clove plantation, is to be provided with roads, and this year \$400,000 will be put to this purpose. Uganda's roads, however, are good. It has 600 miles of all-weather motor roads, while a further 800 are passable for trucks in the dry season. Settlers in Uganda fully appreciate the advantages of good roads. Three-tonners are considered the most serviceable type here, but Ford and Chevrolet 1-ton trucks are very popular throughout the entire district.

This market has been quiet since the war, chiefly because the cessation of hostilities against German East Africa left a large number of surplus vehicles in the area. These, however, have now been absorbed, and the demand is steadily increasing. During the last quarter of 1920, for instance, Kenya alone took \$400,000 of motor vehicles, mostly from the United States. Utility is considered before appearance, and rough going makes high clearance essential. There should never be a dearth of good drivers in East Africa as the natives show a natural aptitude for managing motor vehicles. This is an important factor as the climate, though generally healthy, is not fitted for manual labor by whites.

Gasoline is expensive in East Africa. A 20 per cent import tax is made on it, and when in the country the effects of altitude cause a wastage of 25 per cent. Oil has been found in Uganda, but whether it will prove a paying proposition has not yet been ascertained. A factory has been erected near Nairobi for the production of natalite, considered the future automotive fuel for East Africa. Much depends, however, on whether enough sugar will be grown locally for its production.

With transportation vital to East Africa's development, and with the authorities striving to improve communications and find settlers, manufacturers would be well advised to establish agencies at Kilindini, Nairobi, Kampala, Tanga, Dares-Salaam, or Zanzibar. During the last decade America has practically monopolized automotive demands in East Africa, but an effort must be made if this position is to be maintained.

## Canadian Farmers and Automobiles

**C**ANADIAN registration figures published recently show that the farmers of Ontario own 36.8 per cent of all the automobiles in that province. And near Winnipeg there has been found a grain farm of 12,000 acres upon which not a single horse is used, nor a single head of livestock raised. All the work is done with trucks and tractors. It was figured that 400 horses would be necessary to do all the work on the farm, and grain from 2000 acres would be required to feed them.

The total number of cars owned by the Ontario farmers is something like 75,000. The tradesmen own 11.7 per cent of the cars in the province and business men 10.8 per cent. The balance is scattered among people in various walks of life.

The light car is still the most popular in Canada. The touring car is the model preferred by 89.1 per cent of passenger car owners, the roadster by 6.7 per cent, sedans 2.2 per cent and coupés 1.8 per cent. Taxis and buses number about .2 per cent of the total.

**T**HE following statement from the J. I. Case Threshing Machine Co. refers to the article published in AUTOMOTIVE INDUSTRIES of Oct. 27 concerning the recent British tractor tests:

"We note that on tractor No. 10, 46 horsepower Case, no belt tests are given because the tractor did not line up in the time allowed. This statement is misleading because it would appear that the engine could not be lined up to the brake within the time allowed. Our representative reports to us that there was no difficulty in lining up with the brake but that the brake was of too small capacity to measure the power which can be developed by this tractor."

# Marketing the Motorcycle

## Part I

Besides asking "Where is the motorcycle going?" it is pertinent to inquire "How is it going to get there?" This article and the one following attempt to outline the factors underlying an answer to this second question. The principles involved in determining the extent of the market are discussed.

By Norman G. Shidle

**A** FRANK consideration of fundamental factors is always essential to the building of permanent progress. In planning commercial growth, it is more important to discover true basic facts than to successfully defend unsound methods and practices. An analysis of such facts may show serious defects in an industry, but in doing so provide accurate data upon which to base plans for a successful future. Tradition is a strong master and sometimes a hard one. The overthrow of tradition does not necessarily mean progress, but it often does. Tradition, the lesson of the past, is valuable in planning future progress in so far as it is regarded as one of the factors to be considered in a broad analysis; it is detrimental, in so far as it tries to force all other facts and conditions to conform to its standards.

Merchandising the motorcycle constitutes, perhaps, the most intricate and complex commercial problem in the automotive industry. The automobile and the truck will have far to go as regards marketing methods, but their field is comparatively well defined and the general type of vehicle has been determined. Analysis of statistics and other data shows, moreover, a healthy and comparatively permanent growth in these lines. This is not true of the motorcycle. The apparent failure of the motorcycle industry to record normal progress during recent years was discussed in a series of articles in *AUTOMOTIVE INDUSTRIES* some months ago. The factors developed in these previous discussions have a direct bearing on the vital merchandising problems which confront the motorcycle industry at the present time. A survey of the motorcycle situation at this time brings to light this fact:

Upon the ability of the manufacturers and dealers to develop and operate an effective merchandising policy rests the future of the industry. The sales department and the work of sales research will be most important factors in answering the question "Where is the motorcycle going?" The time for "abiding faith" and general ideas as regards the field for the motorcycle appears to have passed. The accumulation of accurate facts and data and a thorough analysis and interpretation of such facts is the immediate task of the industry.

The problem divides logically into two parts which may be summarized briefly as follows:

1. To analyze the field so that a given territory, and finally the sum of all territories, can be appraised with something like accuracy; to determine as nearly as possible the potential field and the people comprising that field.
2. The development of a merchandising plan based upon the results of this analysis; a merchandising plan which will be progressive and comprehensive in a way which would be impossible without the analysis to define the field and point to the goal; a plan specially adapted to the type of machine manufactured.

---

**"T**HERE is a big future for the motorcycle in the United States; there is a large potential market that has not yet been sold," said one prominent manufacturer.

"The field of the motorcycle is extremely limited; I see but little opportunity for it to develop in this country," said another.

The substitution of careful marketing research for general opinions based on general ideas and experience is one of the chief immediate needs of the motorcycle industry.

---

The second of these phases has been frequently discussed, but there is still much to be said and much to be learned. Any discussion of the second phase, however, can be of only limited value unless it is based upon a rather thorough investigation of the first phase. Unless there is something like accurate knowledge as to markets—and there is no such knowledge at present—a discussion of actual merchandising methods can have only a general and somewhat

aimless direction. There are certain selling methods, of course, that would obviously be of equal advantage under any circumstances, but efficient selling must rest upon a thorough knowledge of who and what comprise the market.

If a large percentage of the potential motorcycle market, for instance, is comprised of those strongly interested in racing, the expenditure of a large proportion of the merchandising appropriation for racing purposes would be justified. So with the planning and operating of all other marketing plans. To direct and apportion them intelligently, something like accurate data is needed upon which to work. Such data can be obtained only by hard work, careful study, long periods of investigation and considerable experimentation.

It is always impossible, of course, to estimate a market exactly, because the appearance of a new product often creates new prospects in itself. The Ford automatically made prospects of many people who never before considered themselves automobile prospects. Consequently, any sort of estimate attempted must be empirical in nature. It is, however, none the less valuable as a basis for plans and operations.

Various men in the motorcycle industry have their own opinions as to where the motorcycle market lies, how broad is its extent, and what are the limits of its development. But little work has actually been done to collect statistics or develop fact-data upon which to base a sound decision. The very fact that several men, all of them long associated with the industry, have widely varying opinions on this point indicates the lack of real research and the absence of comprehensive data.

In attempting to analyze the motorcycle field in this way, the possible market may be divided for general purposes into three classes:

1. Those who are already motorcycle prospects; who ride or would like to ride a motorcycle as it is now built and merchandised, and ridden. How many and what type of machines do these prospects want?
2. Those who could advantageously use a motorcycle; whose life would be more pleasant and more efficient if they owned a motorcycle, but who at the present time have no desire for a motorcycle. How many and what type of machine can be sold to this class?
3. Those who, for various reasons, are not and never will be prospects for a motorcycle.

To have the data on these three points would make it possible to determine with some degree of accuracy what is the actual field of the motorcycle in the United States, what demand can be expected, what room there is for development, and in what parts of the field development is lacking. Briefly, it would permit the making of intelligent sales and production plans.

What are the factors to be considered in such an analysis and how can the analysis be made? In *AUTOMOTIVE INDUSTRIES* of July 7, this same problem was discussed as regards passenger cars. A part of that discussion will apply as well to motorcycles, but much of it will not. Nevertheless, an examination of that article will be of value in connection with the present discussion. Determination of motorcycle markets rests upon different bases than the making of similar studies for passenger cars. Certain variables appear in a motorcycle analysis not encountered in the former case.

A certain part of the potential motorcycle market, for instance, is continually changing, namely the young men who ride the machines simply for sport purposes; the class who ride for the thrills and the pleasure; with whom the motorcycle is a hobby—and like most hobbies a temporary proposition.

There is one chief difference between the market analysis for automobiles or for any given automobile and that for motorcycles. Almost every man or family with sufficient income is a prospect for an automobile. The size of his income is usually the determining factor in deciding the class of automobile for which he is a prospect. In other words, the financial status of a man largely is responsible for whether or not he is a prospect for some kind of automobile in the United States. This is not true as regards motorcycles.

While a man must have a certain amount of money to buy and operate a motorcycle, it cannot be said that all

those above that given amount are motorcycle prospects. Moreover, even if the financial upper and lower limits were determined for motorcycle ownership, it does not follow that the man with the larger income would necessarily be a prospect for the larger rather than the less expensive motorcycle. This is true because the factors of age, strength, safety and operating ability enter to so large an extent—all of which are almost entirely absent in making an automobile analysis.

A proper estimate of the motorcycle market cannot be made, however, without considering automobile statistics, even though sales work in the motorcycle field be based upon an entirely different approach and entirely different factors. The variable factors make territorial analysis for motorcycle sales extremely difficult, but none the less necessary to intelligent sales effort. Because of the great difficulty, however, it is probably best to begin with a small territory, since the analysis must be intensive and as accurate as possible if it is to be of value.

The results of intensive analysis of a given territory will not aid in planning production, of course, except in so far as the given territory is typical of the country. It will give facts as regards that territory, however,

which will enable the manufacturer to determine just how many motorcycles of each type may be absorbed in that territory, how many prospects there are in each of the various classes and how well the dealer is cultivating his territory. Moreover, if the territory analyzed is typical of other similar territories, the results obtained will be of wider value immediately.

Gradually, of course, the entire country must be so analyzed, the results of all the territories correlated, and production and sales plans based

upon the results so obtained. Intensive study in a given territory, however, would allow the working out of all the factors involved and their proper correlation. Enough benefit could be derived to pay for the effort expended and the results would aid in determining standards on the basis of which the sales studies could be extended as indicated.

In an attempt to bring this discussion into the realms of practical selling interest and to indicate in a more specific way the lines along which such analysis may be worked out, we may take up a particular case. It may be frankly stated at once that many defects may be found in the figures and the proportions contained in the following attempt at analysis. No extensive research or field work has been done to make the actual figures correct. Even the reasoning may be defective at certain points.

Nevertheless, the effort may achieve its purpose of showing the principles upon which such analysis may be based and of indicating in a general way the lines along which such analysis may be carried out. A following article will discuss the second phase of the merchandising problem indicated previously, on the basis of some of the more recent developments in the motorcycle industry. With these facts in mind we may proceed to the test case. An actual state territory may be taken as an example to illustrate the principle more clearly.

Among the important factors to be considered in selling or analyzing a motorcycle territory are:

1. Population.
  - a. Males between 15 and 21.
  - b. Working and factory population.
  - c. Merchant and professional population.
  - d. Office workers, male.
  - e. Number of merchants having a light delivery problem.
2. Motorcycle registration.
3. Number of Blank motorcycles already in territory.
4. Number of each of competitive makes in territory.
5. Automobile registration.
6. State police functions for which motorcycle might be used.
7. City police functions.
  - a. Speed violation squad.
  - b. Park patrols, etc.
8. Local traffic conditions (as detailed an analysis as can be made).
9. Local business.
10. Economic conditions.
  - a. Local.
  - b. Individual.
11. Human and psychological factors.
12. Garage and parking facilities.

The population of the given territory is 223,003. Counting 4.5 persons as the average family, there are in this territory 49,556 adult males. We may presume, for statistical purposes, that automobiles are owned only by adult males.

Registration statistics show us that there are about 15,000 passenger cars owned in the territory. It is logical to assume that none of these car owners are motorcycle prospects. Thus the total of 49,556 adult males is reduced to 34,556. The present motorcycle registration in this territory is about 500.

Census statistics show that in this territory there were approximately 24,744 male wage earners during 1919 in factories employing 100 or more men and women, while there were in these manufacturing establishments 3076 executives and office workers. The total of these two is 27,820 male workers in manufacturing industries.

Assuming 34,556 male wage earners in the entire territory, this leaves 6736 male workers as merchants, professional, and business men not directly connected with manufacturing plants. The number of boys between 15 and 20 might be estimated on this basis at about 12,000. This is a very rough estimate, but will serve for the sake of this example. Some boys of this age will be prohibited from operating a motor vehicle in certain states. This factor must be considered. Moreover, many boys between the ages of 15 and 20 will be included among factory workers. This 12,000 may be assumed to include only those boys between 15 and 20 who are not factory workers. (Final census figures, of course, will give such data as this accurately, such estimates as these being unnecessary.)

So far our figures line up as follows:

Total male wage earners (automobile owners excluded)	34,556
Factory workers	24,744
Factory office employees	3,076
Merchants, professional men, etc.	6,736
Motorcycle registration	500
Automobile registration	15,000
Boys	12,000

Next it should be possible to determine the present distribution of motorcycles according to the various classifications involved. This information is probably not available at the present time, but data of this kind should be built up by the various factories and later pooled for the benefit of all. For the sake of the example, however, let us suppose the distribution of the 500 now in use is as follows:

Factory wage earners	350
Boys	100
Merchants, etc.	25
Factory office employees	25
	<hr/> 500

Suppose the Ford to comprise 50 per cent of the total registration. This would give a total Ford registration of 7500. Adding to this the approximate number of other low-priced cars, the total would probably reach something like 10,000. (It should be remembered that such information as this is accurately available from registration records or from companies established to render just such service.)

This would leave a total of something like 5000 middle and high-priced cars. It may be assumed that these 5000 middle and high-priced cars and about 1500 Fords and low-priced cars are owned for the most part by 9812 persons comprised in the factory office employees and the merchant and professional class. This leaves 3312 persons in this class who are not car owners, but many of whom would be financially able to own and operate a motorcycle. We may subtract the 50 already owning machines and about 1000 for factory office clerks also unable to buy and operate a motorcycle, leaving 2262.

The remaining 8500 Fords and other low-priced cars, we may assume are operated chiefly by those classed as factory workers. This assumption is not accurate, of course, but may serve our present purpose. This would leave 16,149 men in this class who are not car owners. Not all of these, however, are motorcycle prospects from the financial point of view.

To determine how many of them are is an extremely difficult problem. Here enters the question of what kind of motorcycle the Blank is, how much it costs to own and operate this particular type of machine. This particular factor will require more careful analysis before it can be considered as anything like accurate.

For the purposes of this example, we may estimate that only 50 per cent of this group is financially able to buy a motorcycle. This percentage probably gives the benefit of the doubt to the motorcycle. Thus there would be about 8072 factory workers financially able to buy a motorcycle. Subtracting the 350 already owning machines, leaves 7722.

Now to consider the boys between the ages of 15 and 21, who may legitimately be considered motorcycle prospects. The workingman's son can hardly be considered financially a motorcycle prospect, since the motorcycle is too expensive a form of sport for the workingman to indulge his son in. Thus we may assume that the boy prospects come chiefly from fairly well-to-do families numbered among the factory office employees, and the merchant and professional classes. Since these classes are but 40 per cent of the factory worker group, the estimated 12,000 boy prospects may be immediately cut to 4800.

The factory office employees not numbered among executives and salaried officials are in no better position to give their sons a motorcycle than is the factory workman. On this score some 2000 more can be taken from this list, since the census statistics say there are 1388 clerks and other subordinate salaried employees in the various factories of this territory. That leaves the number of boys whose fathers are financially able to buy them a motorcycle for pleasure use at about 2500. Subtracting the 100 already owning machines leaves 2400.

There is not space here to discuss in detail the analysis of the police and municipal market for motorcycles, a distinct merchandising problem in itself. This field can, however, be analyzed and the potential market de-

terminated. Let us say in this case that there is found to be a market for 150 machines.

Those having hunting and fishing licenses, etc., will already have been included in one of the classes discussed.

Thus far we have done two things:

1. We have eliminated all those who for one reason or another are not to be considered as motorcycle prospects in any sense.
2. We have determined the total of those remaining after these eliminations, who are financially in such a position as to be motorcycle prospects.

And in the case given, assuming the figures to be accurate—which in several instances they obviously are not—we have the following:

Factory wage earners .....	7,722
Merchants, professional men and factory office employees .....	2,262
Boys (15 to 20) .....	2,400
Police, etc. ....	150
<b>Total .....</b>	<b>12,534</b>

Thus it would appear that there are 12,534 persons in this territory who do not own motorcycles, who are financially able to own and operate a motorcycle, and who are not disqualified as motorcycle prospects by reason of automobile ownership. This group of 12,534 comprises the potential motorcycle field in this given territory. It is to this group that the motorcycle may be sold.

There are, of course, numerous factors that operate to hinder the selling of this potential market 100 per cent. To sell all of them could hardly be expected even under the best conditions.

Certain factors of error are apparent, of course, immediately upon a careful examination of the foregoing analysis, while certain other factors have not been considered because the necessary data was not at hand. Such points as the following fall into that class:

1. The number of merchants having light delivery problems.
2. The number of boys between 16 and 21 included in the number of factory employees.
3. The attributing of the entire Ford ownership to factory employees.
4. The analysis of the police force market.
5. Human and psychological factors; these are fully discussed in the following article.
6. Local conditions of business; traffic.
7. Economic condition of the individual worker.

These and other factors have not been handled with the accuracy and thoroughness essential. Data must be developed for some of them, as it is not available at present in the form adapted to an analysis that is to form the basis of actual plans. The example may serve, however, to indicate the lines along which such analyses can be made. There is nothing specially novel in the methods outlined, but they have not been intensively applied to motorcycle merchandising.

Having collected such data, the next step is to use it properly. It is a waste of time to collect statistics as a matter of interest. The intelligent utilization of this data comprises a major part of the second phase of the entire merchandising problem defined near the beginning of this article. This second phase is discussed in a following article, which will appear in AUTOMOTIVE INDUSTRIES in the near future.

## A "Vacuum Piston" to Prevent Burning Crankcase Oil

A NOVEL design of internal combustion engine piston, embodying features intended primarily to prevent the burning of the crankcase oil as it comes in contact with the lower side of the piston head, is being exploited by Hold-Mar Vacuum Piston, Reg. A pressed-steel, air-tight chamber from which some of the air has been exhausted is chill-cast into the upper part of the piston directly underneath the head. After the air chamber is in place in the piston a small hole is punched through the center of the lower face, some of the air is then forced out from the chamber by heating, and the punch hole is sealed up by soldering. In this manner a vacuum of about 8 in. mercury is obtained in the chamber, we are informed.

It is claimed that the use of this "vacuum" chamber prevents the "coking" of the oil on the piston and that no gritty matter can be found in the crankcase oil of an engine equipped with these pistons after it has been in service for a long time. The crankcase oil, it is claimed, remains at a lower temperature than in an engine with ordinary pistons, which seems quite logical.

We understand that several sets of these pistons are at present undergoing tests by the experimental departments of leading companies, and the outcome of these tests will be awaited with interest. Engineers will be especially curious regarding the effect of the vacuum chamber on the tendency of an engine to knock. It is evident that with a heat insulating chamber below the piston head the latter will reach a higher temperature than if it was subject to the cooling action of the oil spray, and with a higher piston head temperature it

would seem that the formation of carbon deposits on the upper side of the piston head would be promoted.

Another point to be considered is that the deterioration of crankcase lubricating oil is due to two causes, viz., dilution by the unburnt heavy ends of the fuel and the formation of solid carbon particles, which latter are apt to get into the bearings and wear them out.

Section of Hold-Mar vacuum piston

The question then arises whether the oil becomes unfit for lubrication first through dilution or through contamination with burnt oil. It is, of course, not impossible that the heat insulating qualities of the "vacuum" piston have some effect on the rapidity of dilution, though it is obvious that they cannot entirely prevent it.

# Increased Efficiency Through a Decentralization Process

Executives of dominating establishments in several lines of industry have admitted that they cannot compete with concerns of medium size in the same line. Mr. Tipper, in this article, shows that it is impossible to get the same returns from a group of vast size as from the medium sized unit.

By Harry Tipper

**D**ISCUSSIONS have been occurring for some time among business men of economic training concerning the group limitations in size and number of units necessary in order to secure the maximum of efficiency in the individual of the group.

It is important for the manufacturer to remember that no single element of the mechanical fabric of industry has justified by the past development, the tendency to increase the industrial group, because the past development has been almost entirely the building of the fabric and not the operation after it is fairly complete.

This mechanical system of industry has been building from the beginning of the nineteenth century until the World War. In the building of this fabric some groups have been enlarged by the natural centralizing of control and other groups have been separated by the natural decentralization process.

Human variation makes it impossible to secure the same maximum efficiency out of the individual with a group of 25,000 people working in one establishment as with a group of 500 working together. There is a law of diminishing returns in efficiency, in the human skill and activity itself, and this law makes it difficult to secure the same amount of co-operation, intelligent effort and relative co-ordinated skill in the large group.

**It is interesting to note that in some important lines of industry to-day the largest operators in those industries are unable to manufacture and sell a given quality and quantity of material at a price at which smaller units in the same field are able to deliver.**

Because the introduction of machinery and its increased use demanded the co-operation of larger groups of individuals in the same establishment, we have been led into the assumption that the larger the group, the greater the efficiency. In making this assumption, however, we forget that the new discoveries in productive appliances of a mechanical kind automatically increased the productivity of the individual without reference to his increased capacity.

As the improvement in mechanics slows up and the industrial fabric becomes integrated into a thorough skeleton of organization from a mechanical standpoint, the increase or decrease in the human efficiency becomes more important in its effect upon the economic position of the group.

In fact, this increase or decrease may make the difference in competitive strength in the near future because of its influence upon the cost. Signs are not wanting that there is a definite economic limit beyond which it is unwise to centralize organization, and at which point it

is necessary to begin the consideration of decentralization.

The elements of understanding, the freedom of action, the spirit of co-operation become more difficult to insure as the group becomes larger, the centralized system more complicated, and the motions require references to a larger number of supervisors in order to secure a decision. The rules and regulations become paramount when the centralized system governs so large a field and operates through many hundreds of supervisors and many thousands of subordinates. This danger increases much more rapidly as the organization grows from medium to great size than it does when the organization develops from small to medium size. The tendency for rules to grow more rapidly than the requirements of business is much more marked in the management of the larger groups.

In one of the important industries connected with the automotive field where a few of the larger companies represent groups five or eight times the size of any of the others, the amount of business they are securing from the field represents a very much smaller proportion of the total business than their percentage of investment would demand. They are unable to meet the stress of competition as successfully as the medium size concern, because of the many factors involved, the complicated system of operation demanded and the neutralization of their buying and capital advantages by the inefficiencies, lost motion and expense involved in these complicated systems that have grown up with the centralization of control.

Even the officers in such organization are restricted by the scattered ownership and the limitations imposed upon them because of the character of the financial control. While the medium size organization with its ownership centralized largely in its active officials can decide a policy at short notice and with no great discussion, the question of such a policy must roll through a larger organization from the local head to the general management, thence to the directors, and, frequently, thence to the officers and the financial committee, before any change can be made. This consumes an enormous amount of time, effort and expense. It reduces the flexibility of the organization. Even the officers must consult the traditions, the rules and the regulations of the concern before they can take any radical steps that may be required by the economic changes.

The rapidity of action decreases from top to bottom of the establishment. The flexibility of movement required for rapid progress is less possible and the initiative itself is decreased by the difficulty of seeing the

visible results of the suggestion or the improvement, upon which the individual supervisor or executive has put his energies.

The man who has been handling one factory as a production man is called upon through the exigencies of such organization to preside over the operations of twenty factories and enormous distributing and marketing problems. Nothing in his past experience has fitted him for this responsibility. As the general manager of one factory, he has been governed by the rules and regulations of the executive offices, and irritated by the length of time and red tape involved in the discussions of any new question. Faced with a new problem, he finds himself obliged to accede to the routine of decision, the centralized operations of the system as it is already established, and to depend upon traditional methods very largely for his own government of the matter.

Leadership is possible in a very definite sense in an organization of medium size. There is no training for leadership in the organization of vast size. The man who becomes the head of such organization arises from some specialized branch in the financial, production, or marketing organization. The interrelated economic problems, production necessities, sales operations require an understanding of fundamental business which he has had neither the opportunity nor the necessity to secure.

In a lesser degree this is true all through the executive organization of the dominating concern.

The present position of such organization is no justi-

fication of it as an economic unit and the tendency to decrease individual efficiency in all the elements of operation and management, is likely to change the economic position of such organizations in many lines of industry in the future.

Some lines of business require, because of their physical necessities, the co-ordination of large groups, but for the majority of businesses this co-ordination is not necessary and is economically unsound from a human standpoint, because of the diminishing returns in human efficiency.

The questions put to executives of dominating establishments in several lines of industry have brought the admittance that they cannot compete with medium size concerns in the same line. If the economic speed of development of the past twenty years were to be maintained, this would not be so important, but the evidence is that the economic development in the future will be more difficult, harder to realize and require a greater degree of efficiency in order to secure it.

The law of diminishing returns has its reflex in the grouping of individuals in production in just the same way as it operates to increase the cost of the marketing. This means that it becomes more and more difficult to secure a high efficiency in the individual as the number in the centralized system grows.

The industrial engineers who have begun to bend their energies to the work of decentralization are working along lines that suggest possibilities of improvement in connection with the deeper problems of industrial operation.

## Time Study Methods

“**T**IME Study and Job Analysis” is the title of a new book by William O. Lichtner, consulting engineer in management and construction. The book enters into a detailed study of production standardization and offers suggestions and results of actual experiences in this work.

The first chapters of the publication deal with the principles of job standardization and the author enters into the applications of these principles to methods of time study and job analysis. He also points out the necessity of securing the right man as an analyst in a plant and the various qualifications he must possess. This portion of the book, however, is mainly a review of what most men in industry know, and is used as a background for the other points brought out in the rest of the work.

Training the personnel of the department that makes time studies and works out methods for increasing production is a subject Mr. Lichtner places considerable emphasis upon. He points out that the work is somewhat in its embryonic stage, and comparatively few specialists have been developed along that line. The necessity for training men in the department is generally recognized, and a method for this sort of work is described in the book. Clerks and others are given an opportunity to develop into assistant analysts by this method, which he calls a “Non-Intensive Course in Training.” This training is accomplished while the employee is actually at work and is done under the direction of the man at the head of the department.

An intensive course, however, is recommended in plants of any considerable size. This course would be under the direction of an instructor, and while those enjoying its advantages would be employed in the department, the course would be a thing apart from their

work. Time study is the thing upon which most stress is laid. Mr. Lichtner would base the course upon the four following principles:

1. Instruction in the use of the stop watch and time study sheets.
2. Instruction in the fundamentals and technique of time study by means of exercises in the office.
3. Practice in use of slide rule.
4. Practice in field work.

A detailed description of how this course should be given is contained in the book. Mr. Lichtner points out the necessity for cooperation between the analyst and the workmen in the factory and especially for establishing pleasant relationships with the various foremen with whom he comes in contact. Methods of making time analyses are fully described throughout the book and various examples are given to show the value of such procedures. A thorough study of practically every element that enters into the subject is undertaken. The question of bonuses to employees comes in for a good share of discussion and a number of methods that have been successfully employed are described in detail.

Perhaps the most striking feature of the book throughout is the emphasis placed upon the value of maintaining agreeable relationships among the employees of a factory. The human side of the factory is just as important as the mechanical part, the author contends, and in determining time standards as much consideration should be shown the employee as the machine at which he works.

The book is illustrated with charts and diagrams, showing both the methods and results of various time studies. It is published by the Ronald Press Company, New York.

Automotive Industries—The Automobile is a consolidation of The Automobile (monthly) and the Motor Review (weekly), May, 1902, Dealer and Repairman (monthly), October, 1903, and the Automobile Magazine (monthly) July, 1907.

## Relations With the Dealer

IF manufacturers had long enough ears—the phrase is used figuratively and in no sense facetiously—to reach into the offices of their dealers they would hear these days many things about manufacturer-dealer relations which do not get to them through the reports of territorial travelers. They would hear dealers voice their opinions about contract relations, allotments and warehousing of cars, subjects which their travelers report with more or less regularity, but they would also hear the murmurings of a growing feeling among the merchants of the industry that manufacturers could do more, should do more, than they have in most cases to assist in the retailing of cars and in the maintaining of owner good will.

The manufacturers would find dealers battling with three major problems of their individual businesses—finance, sales and service. They would find a sentiment, while it upholds the independence of the dealer as an independent business man, that looks to the manufacturer for a broader co-operation in selling the car and keeping it sold.

The question of finance, vital as it is, has individual angles, as for instance such a situation as a well-to-do dealer handling the product of a manufacturer whose business is still in a stage of growth that limits his financial resources. But the fact remains that many dealers are going forward to-day because the manufacturer has intervened in one way or another to enable the dealer to obtain bank acceptance or corporation support for wholesale or retail financing.

The subjects of sales and service, on the other hand, are less involved, which accounts for the greater insistence on the part of dealers, hardly articulate yet, to be sure, that the manufacturer assume a larger burden of co-operation.

A dealer, with his manifold problems of management, sales and service, can hardly be expected to know the car and the reasons for its being built the way it is as well as the combined intelligences of his engineers and sales department know it. Catalogues and other descriptive literature have played their part in informing the dealer, but there can be, in many factory organizations, much more intensive study of retail selling problems than there has been and there should be a closer tie-up between the factory selling organization and the dealer sales staff, so that everybody will tell the same story about the car and tell it in the most effective way.

When we come to service we find a few brilliant examples of manufacturer-dealer co-operation in the preparation of service manuals, of records of time required for service operations and of flat rate guide books. But we find far more factories whose service literature is limited to instruction books for car users—and many of these are practically worthless. The factory has built a car and passed it on to the dealer to sell and service, but has told him nothing about how to service it. The doors are locked between the dealer and the wealth of information in the factory engineering department which ought to be adapted for use in the problem of making satisfied owners.

There has been some progress in factory recognition of the service problem, but it is far from being as rapid or as steady as it should be. There are still too many dealers experimenting on owners' cars to discover the best methods of performing certain repair operations and to learn what are fair prices for service work. And there are still too many factory service managers who do not enlighten the dealer on either of these problems.

Advantages of Light Alloy  
Pistons

LIGHT alloy pistons seem to have greater advantages for motor vehicle engines than has been imagined, if the tests recently conducted in Germany are a criterion. The advantages, moreover, do not seem to be limited to the field of high-speed passenger car engines, but to be particularly pronounced in the case of truck engines, which are governed to run at moderate speeds only. In the case of the truck engine on which the dynamometer tests were carried out, the maximum output was increased about 20 per cent without any increase in fuel consumption.

This increase in power and in fuel economy is evidently due to the use of a higher compression pressure which was found permissible with the alloy pistons. This is a factor which, so far as has come to our attention, has not been investigated in this country. We take it that in most cases in which alloy pistons have been substituted for gray iron pistons, the same compression ratio has been retained. With an engine otherwise well cooled, and especially one in which there are no valve plugs and in which the spark plug bosses are completely surrounded by water, the piston heads are undoubtedly the hottest points, which determine the limiting compression. The light alloys used for piston castings, such as aluminum and magnesium alloys, having a much higher heat conductivity than cast iron, the piston head does not get nearly as hot under otherwise similar conditions, and an increase in compression ratio is therefore permissible. It would probably not be safe to assume that the high compression ratio found the most advantageous by the German contest committee could be used with satisfaction in practice, as in the contest conditions were naturally the best; but the comparative results obtained with cast iron and alloy pistons are nevertheless suggestive.

It is also noteworthy that the best all-round results in the contest were obtained with a magnesium and not with an aluminum alloy. The earliest aluminum alloys used for piston castings had a small magnesium content and were known as magnalium alloys; but the alloys used in the prize-winning pistons in the contest consisted mainly of magnesium and did not contain any aluminum at all. Attempts have been made in this country to introduce magnesium alloys for piston use, but up to date no great amount of progress seems to have been made. It may be that engineers have been afraid of too rapid wear, as magnesium is a rather soft metal. It is, therefore, rather reassuring to learn that, according to the endurance tests made by the German contest committee, magnesium does not have to show a high scleroscope value to be satisfactory from the durability standpoint.

Heretofore manufacturers of light alloy pistons have regarded the high speed engine field as their best market, but these trials would seem to indicate that there is a large potential market for these pistons in the truck and tractor engine field.

## Practical Optimism

IT is worth while to investigate the optimistic reports concerning certain phases of automotive business, because behind those optimistic reports lie sales. The fact that someone else has actually been able to do some profitable business in lines and places frowned upon by the pessimist, indicates that others may be able to develop similar markets.

Some export agencies in great shipping centers are specially vehement, for example, in declaring how dead the export trade is in automotive lines. Yet one truck manufacturer has just sent in a report that he has sold ten trucks to the Gold Coast, Africa. Another truck manufacturer has interested large South Ameri-

can interests in the flanged-wheel railway bus developed by his company.

Much depends upon the care with which markets are investigated and the methods with which such business is handled once a lead has been developed. Optimistic reports are valuable for more than merely making someone smile. They indicate the possibility of actually doing business.

## Encouraging Kicks

MANY car owners have been dissatisfied with the service that has been rendered them on their cars. Manufacturers have only an indirect control over certain phases of this service, but exercise more direct influence on such factors as prices of parts, etc. The service departments of certain companies have come to see clearly the value of direct criticism and comment from owners of their cars. Engineering departments have gained information in this way; sales and service departments may be equally benefited.

The somewhat general dissatisfaction with service and parts prices is common knowledge, but the company which encourages direct criticism from its owners may be able to remedy faults in its own organization before they have hindered the sale of future vehicles. An owner wrote recently, for example, to a large car manufacturer, making the following statement:

"I have owned a Sennett car since 1917 and have derived considerable satisfaction from its use. However, when I have had occasion to replace parts, the charges made by your local parts department have been so exorbitant and outrageous in proportion to the obvious cost of the article delivered to me that I have determined as a matter of principle, if nothing else, never to buy another Sennett. . . . A canvass of the thoughts of various owners leads me to the conclusion that I am only one of the great army of car users who feel in this manner. . . ."

There was more to the letter, but the excerpt given presents the essential thought.

The manufacturer to whom this letter was written apparently was one of those who appreciate the value of such direct contacts with the user. The reply from the president of the company said in part: "I regret to note that the Sennett parts prices have not been satisfactory. . . . I have to agree with you that against present market costs many of the parts are a little out of line and you may rest assured that these matters will be adjusted as soon as possible. We are reorganizing many of our departments at the present time, and in a large plant such as ours it will require a few months still for us to arrive at safe new costs. . . . You need not hesitate to write us exactly what you think, for we are soliciting from our owners and dealers just such information as your letter gave. Thank you for the frank spirit of your letter."

The manufacturer who can sincerely thank an owner for a critical letter of this kind is well on the way to an analysis of his service problems which will ultimately lead to satisfied owners and resales.

# Third Quarter Output Surprises

## Compares Favorably with Period in 1920

Official Figures Show Aggregate  
of 511,510 Cars and  
Trucks Produced

NEW YORK, Nov. 22.—Official production figures showing a total output of 511,510 passenger cars and trucks for the third quarter of 1921 prove conclusively that the "slump" in the automotive industry has been more imaginary than real. This figure is only approximately 55,000 less than the production for the same period of last year which included two of the best months in 1920.

In July, August and September of this year there was a truck production of 57,322. This probably was about 7000 less than the output of commercial vehicles for the third quarter of 1920. While by far the greater portion of the trucks sold this year were light delivery vehicles, a comparison of the totals is impressive and demonstrates that a considerable number of trucks is going into service constantly.

It is perfectly safe to say that no commercial vehicles have been made for which there has not been an immediate market. The same is true, to a very large extent, of passenger cars. It is highly probable, however, that in the coming year the production of trucks will increase, proportionately, much more rapidly than that of motor cars.

While there are indications that there will be a considerable shrinkage in the number of individual manufacturers, the highway transportation industry is merely in its infancy and the next few years will witness a development which will parallel that of the passenger car. It will keep pace, in general, with improvement in general business conditions. Vocational selling will be intensified and it already is making rapid progress in many lines of industry.

The volume of sales has fallen off considerably since October in most sections of the country, although there are a few districts in which there has been little change. It is probable, however, that there will be a gradual decline until after the turn of the year.

The interest of the industry and of

prospective purchasers is centered more closely than in years on the approaching New York and Chicago shows. As a consequence there is a disposition on the part of the public to delay purchases, except of inclosed models, until after that time.

An extraordinarily large number of new models will be displayed at the shows this year and some unusually interesting announcements are being withheld until that time by manufacturers.

## Lang Body Co. Obtains Contract from Stutz

CLEVELAND, Nov. 21—The Stutz Motor Car Co. of Indianapolis has released its entire production of enclosed bodies to the Lang Body Co. of this city. Work on the job will extend over a period of months.

The Lang body is being used on a Stutz four passenger coupé. It is a semi-custom built body, all aluminum, with broadcloth trimmings throughout. The enclosed model has been added to the company's line because of the increasing demand for this type of car. Plans for the model were made last year but production was delayed.

Lafayette, Lincoln and King also have turned their enclosed body work over to the Lang company. Business during November is far ahead of the volume for the same period in 1920, it is announced at the Lang plant.

## Concordia Fire Insurance Drops Automobile Section

MILWAUKEE, Nov. 21—The action of the Concordia Fire Insurance Co. of Milwaukee, one of the largest stock companies in the Northwest, in discontinuing its automobile department has resulted in considerable agitation of conditions affecting all forms of insurance protection of motor vehicles. The only explanation of the Concordia's action is that "the unsatisfactory condition of the automobile business is responsible for the move."

## TRUCK SALES MANAGERS TO MEET

WASHINGTON, Nov. 21—Gordon Lee, chief of the automotive division, Bureau of Foreign and Domestic Commerce, Department of Commerce, will tell the National Association of Motor Truck Sales Managers in Detroit on Dec. 2 just what the Government is doing to promote interest in the automotive industry. He will appear as a special representative of Secretary of Commerce Hoover and will deliver an address at the cabinet officer's request.

## Collins Reorganizes Peerless Personnel

Anibal Succeeds Strickland as Engineer; Cunliffe, Schmunk  
as Sales Manager

CLEVELAND, Nov. 21—Reorganization of the personnel of the Peerless Motor Co. under the new management of R. H. Collins, president and general manager of the corporation, has been started with the appointment of B. H. Anibal as chief engineer to succeed W. R. Strickland, whose resignation has been accepted, and C. R. Cunliffe as general sales manager succeeding Robert J. Schmunk, also resigned.

For years Anibal has been with the General Motors Corp., resigning a short time ago to assist Collins in the development of his plans. He joined the Cadillac engineering staff in 1911 and assisted in designing in 1912 the 4-cylinder Cadillac which first used the electric self-starting system. He was also associated with the engineering department of the Oldsmobile. During the war he was connected in an engineering capacity with aircraft work for the Government.

Strickland, whom he succeeds, has been identified with Peerless for many years.

Cunliffe, who becomes general sales manager, has been regarded as one of the stars of the Cadillac distributing force. He was with the organization when Collins was president of the Cadillac Motor Car Co. and resigned as general manager of the Chicago Cadillac branch to come to Cleveland. Before going to Chicago he was manager of Cadillac in the Philadelphia district. In both cities he made fine records.

Schmunk resigns after a continuous service of 14 years with Peerless. He has not announced his plans for the future beyond a statement that he will take a much needed vacation, probably in California.

Ever since Collins took control of Peerless his engineers have been making an intensive study of conditions and an early announcement is expected of an aggressive campaign to increase sales and production.

## WILLYS PLANS 50,000 OUTPUT

TOLEDO, Nov. 22—John N. Willys has announced after an inspection of the Willys-Overland plant here that he believes the company will be able to furnish employment to 12,000 men next year and that more than 50,000 cars will be required to meet the needs of Willys-Overland dealers in 1922.

## Hanson Will Build New Car in Detroit

**Product Will Sell Under \$1,000  
—Financial Backing Se-  
cured in South**

DETROIT, Nov. 21.—Plans of the Hanson Motor Car Co. of Atlanta to manufacture in Detroit a new six cylinder car which will sell under \$1,000 have been disclosed by negotiations entered into by President George W. Hanson for a permanent plant site and for a supply of parts for the new car with leading parts makers of the district.

Under the plans, as outlined, the Hanson Motor Car Co. would be expanded into a company with a capital of from \$25,000,000 to \$50,000,000. The former Hanson line will be continued in addition to the new line, the name of which has not been determined definitely but the new models will be displayed at the New York and Chicago shows, it is stated.

It is asserted that production of the new car will not be less than 50 a day. The plan is to manufacture both in Detroit and Atlanta. It is proposed to absorb several parts plants in the Detroit district into the new company so that the car, with the exception of several important units, would be entirely of Hanson construction.

Specifications for the new car were prepared in the offices of the Hanson company in Atlanta. President Hanson and the chief purchasing agent of his company have been in Detroit for some time consulting with the leading unit makers on the possibility of getting the parts required at costs which would permit a low selling price for the new line. It is declared that they have been entirely successful in this effort and that the new car will be in production early next year.

Aside from fuel economies which are claimed for a new engine which will be used, the car will be strictly conventional in design and operation.

In connection with the news of the Hanson expansion, it is learned that the company is not in any way connected with the proposed merger of a score of companies in the Associated Motor Industries recently incorporated in Delaware. It is understood here that the Hanson enterprise has strong financial backing in the South but the source of it has not been disclosed.

## Receiver Is Appointed for Insurance Company

DES MOINES, Nov. 22.—A. C. Savage, commissioner of insurance, announced to-day that the Interstate Automobile Insurance Co. of Rock Rapids had gone into the hands of a receiver. E. H. Hoyt, former State treasurer and now president of the Solidarity Finance Co. of Des Moines, has been named receiver.

The Interstate's liabilities are given as \$930,000, including \$200,000 capital,

and its assets as \$681,000, making a deficit of \$249,000. The company has been in trouble for nearly a year. It wrote a very large volume of automobile fire and theft insurance in proportion to its resources and, according to its own statement as of Dec. 31, 1920, had less than \$21,000 net surplus left, though \$135,000 had been contributed to surplus during 1920.

It sought to reinsure all or part of its automobile business and go into the general fire business, but agents protested against conference companies helping a non-conference company out of its troubles by reinsuring its business.

## Lubrication Discussed by Metropolitan S. A. E.

NEW YORK, Nov. 21.—At the regular monthly meeting of the Metropolitan Section of the Society of Automotive Engineers held at the Automobile Club of America, Cornelius T. Myers presented a paper on the subject of "Chassis Lubrication." The author pointed out the need for more convenient and effective lubricating means than are usually employed, gave estimates of the great loss which results from failure to lubricate chassis parts properly, and described and compared various lubricating devices and systems now on the market, as well as certain types of spring shackles which require no lubricant.

H. L. Hoyt of the Belflex Corp. gave a detailed description of the fabric shackles developed by that company. An interesting discussion followed the meeting which was attended by 110 members and guests.

David Beecroft, president of the society, gave a brief informal talk on present business conditions in the industry, following the dinner which preceded the meeting. A straw vote on the most desirable place at which to hold the summer meeting of the society showed that a large majority of members present at the section meeting favored Lake Placid.

## RECEIVER FOR SEYMOUR

MILWAUKEE, Nov. 21.—The Seymour Laboratories Units, Inc., manufacturer of automotive parts, has been placed in the hands of a receiver on application of the Matthew Addy Co. of Cleveland. Julius J. Goetz has been appointed receiver. The Seymour company was organized about a year ago and opened a plant to manufacture piston rings, pistons, and similar specialties for the automotive industries. It is incorporated for \$300,000. W. E. Seymour was the founder and president.

## TALKS ON TRUCK SELLING

PHILADELPHIA, Nov. 20.—The importance of selling motor trucks on a clean, business-like basis was stressed at the November meeting of the Motor Truck Association of Philadelphia, by J. H. Feely, of the Autocar Co., who asserted that the tendency to do this has been notably increased on the part of manufacturer, distributor and salesman.

## Seiberling Charters \$55,000,000 Company

**Will Introduce New Cord Tire—  
Two Plants Will Be  
Operated**

AKRON, O., Nov. 19.—Frank A. Seiberling with his brother Charles W. Seiberling and other former Goodyear officials, has formed the Seiberling Rubber Co., chartered under the laws of the State of Delaware. Although the Delaware charter shows incorporation for \$55,000,000 the actual incorporation is for \$10,000.

The company, Seiberling announces will issue 50,000 shares of preferred stock at \$100 a share and 500,000 shares of common stock of a no par value. Under Delaware laws this common stock for incorporation purposes is given a valuation of \$100 a share. The common stock, however, will be issued on a valuation basis of \$10 a share.

## Offices in Akron

The new company, with general offices in Akron, will control and operate two tire building plants, the Lehigh plant at New Castle, Pa., with a capacity of 2,000 tires and 4,000 tubes a day, and the Portage plant at Barberton with a capacity of 3000 tires and 2000 tubes, giving Seiberling a production capacity of 5,000 tires and 6,000 tubes daily. The Portage plant, Seiberling has purchased for \$750,000.

Seiberling was also a bidder for the Republic Rubber Co., of Youngstown, which is in receivership, and although he has announced that he was no longer interested, it is still reported that he may obtain this plant.

Associated with Seiberling will be his brother Charles, former Goodyear vice-president; W. E. Palmer, former Goodyear secretary; I. R. Bailey, former Goodyear assistant sales manager; and W. A. M. Vaughn, until recently secretary and treasurer of the California Goodyear Co. Other Goodyear men also have joined the Seiberling organization. Roy Ellsworth will be Seiberling's secretary.

## To Market New Tire

Officers of the new company will be F. A. Seiberling, president; C. W. Seiberling, vice-president; W. E. Palmer, secretary; W. A. M. Vaughn, treasurer; I. R. Bailey, sales manager; William S. Wolfe, factory manager; Harold King, director of sales personnel; Karl Kilborn, manager of the development department; and W. P. Keith, in charge of laboratories.

The Seiberling company, it is announced, expects to introduce an entirely new cord tire which will be built along radically different basic principles and which can be produced at a lower manufacturing cost.

The company will manufacture automobile and motor truck tires of all sizes and types, specializing in cords for automobiles and pneumatics for trucks.

## Automotive Exports Continue Increase

Figures Indicate Decidedly Upward Trend of Business in Foreign Markets

WASHINGTON, Nov. 21—The October exports of automotive equipment showed a distinct gain in all major items over those of the preceding month, as announced to-day by the Bureau of Foreign and Domestic Commerce, thus testifying in official figures to the statement frequently made in the trade that foreign business is decidedly upward. Passenger cars, trucks and parts each figured in the gains and for the first time in many months each of these items was at a volume larger than during the preceding month.

### Price Cuts Affect Showing

The detailed figures published herewith show the comparison of the October shipments with those of the same month a year ago and with the totals for the ten-month period of each year. Exporters, however, are but little interested in such a comparison, their interest being of the more immediate rise or fall from month to month of the current business. The October figures, showing the improvement in business, should be received by them as an augury that future months hold more than the early part of the year. A comparison for the last three months follows:

Cars		Trucks		Parts
No.	Value	No.	Value	Value
Oct. 2,329	\$1,952,641	595	\$755,096	\$2,702,002
Sep. 2,197	1,870,770	472	481,664	2,570,860
Aug. 2,237	2,265,328	391	434,052	1,786,886

The total value of the automotive export trade, tires not included, reached in October a value of \$5,834,245, a gain of slightly less than three-quarters of a million over the month of September. Many price declines came into effect during the latter month and that served, of course, to reduce the actual valuation. This gain would have been more impressive, without doubt, if the cars, trucks and parts had been priced on the same levels during the two months.

### Motorcycles Decline

These totals include airplanes and parts, motorcycles, motor trucks, passenger cars, automotive parts and the engines that come under the categories of automobile, marine, stationary and tractor. Airplanes, motorcycles and engines in October were under those of the preceding month and consequently all of the gain was recorded in the three major classifications. Motorcycles dropped from 627 with a value of \$151,380 in September to 444 valued at \$115,271, engine shipments declined an approximate \$6,000 to \$296,814, and the airplane shipments were some \$22,000 under those of September.

The automotive exports for the first ten months of this year have reached

## Exports of Automobiles, Airplanes, Trucks, Farm Tractors, Motorcycles and Parts for October and Nine Previous Months .

	Month of October				10 Months Ending Oct. 31			
	1920		1921		1920		1921	
	No.	Value	No.	Value	No.	Value	No.	Value
Airplanes .....	10	\$147,600	1	\$8,000	56	\$546,174	44	\$279,940
Airplane parts.....		6,811		4,421		523,500		136,955
Commercial cars.....	2,345	4,025,161	595	755,096	24,549	38,618,018	6,540	9,469,719
Motorcycles .....	3,161	969,793	444	115,271	29,740	8,242,180	9,684	3,126,557
Passenger cars.....	11,562	14,699,402	2,329	1,952,641	121,788	139,098,944	26,229	28,331,253
Parts, not including engines and tires.....		6,910,538		2,702,002		69,337,409		33,828,455

### ENGINES

	Month of October				10 Months Ending Oct. 31			
	1920		1921		1920		1921	
	No.	Value	No.	Value	No.	Value	No.	Value
Automobile, gas.....	496	\$128,158	424	\$92,553	30,026	\$4,904,539	7,001	\$1,482,701
Marine, gas.....	619	255,628	114	32,544	8,129	2,663,656	3,706	1,316,435
Stationary, gas.....	2,844	472,399	582	97,419	25,381	4,470,615	8,513	1,998,825
Tractor, gas.....	1,543	1,679,076	39	74,298	19,177	18,513,529	2,736	3,388,771
Total.....	5,502	\$2,536,261	1,159	\$296,814	82,713	\$30,552,339	21,956	\$8,186,732

### IMPORTS

	Month of October				10 Months Ending Oct. 31			
	1920		1921		1920		1921	
	No.	Value	No.	Value	No.	Value	No.	Value
Automobiles (Imports)	41	\$63,487	62	\$75,074	787	\$858,397	461	\$773,845
Automobiles returning to point of manufacture (re-imports)....	459	522,089	130	237,187	4,849	7,718,372	3,312	5,258,944

the imposing total of \$83,359,611, which is approximately 34 per cent of the total shown for the corresponding period of last year. This figure will probably come as a surprise to many exporters, who have based their calculations on the existing markets solely in a comparison of the number of passenger cars sold. Cars, it is true, have declined materially but the shipments of parts have been at a higher level, giving a firmer tone to the market as a whole.

### Trucks Best Since March

The October shipments of cars, trucks and parts were the largest for many months. Truck shipments were the largest since April and March, although in those two months the figures were in each case only 14 and 11 higher. Consequently, we must go back to February and January to find appreciably higher truck exports than in October. The car sales were larger in May, April and February, but in each of these months the number was within 100 to 150 of the October shipments, and thus it is necessary to go back to January to find a much higher level. This also is practically true in regard to parts, although the actual value was slightly higher in May, April, March and February.

### SANFORD PRESIDENT DIES

SYRACUSE, Nov. 21—J. Frank Durston, president of the Sanford Motor Truck Co. and the Durston Gear Corp., died last week at his home here at the age of 79 years.

## Receiver Will Continue Southern Truck Business

GREENSBORO, N. C., Nov. 21—Judge James L. Webb in Superior Court here signed an order authorizing Garland Daniel, receiver, to continue operation of the Southern Truck & Car Corp. of this city until the January term of court convenes.

Since the appointment of the receiver the indebtedness has been decreased from \$61,269.04 to \$38,627.15. The assets of the company are given at \$53,871.07, leaving the net worth of the company at \$15,243.92. The receiver is authorized to settle with the creditors at 40 cents on the dollar at once if they are willing to accept this settlement, with the exception of a note for \$10,000 which would be paid in full, under arrangements which have been made.

### BOCK BEARING PLANT SOLD

TOLEDO, Nov. 22—The plant of the Bock Bearing Co. in this city has been purchased by H. W. Bigelow, Jr., from the Standard Parts Co. He is understood to have purchased it as an investment and negotiations are pending for the leasing of the property to some operating company. The plant formerly manufactured roller bearings for the Standard Parts Co. but has been idle for several months. It was one of the units which the Standard Parts Co. creditors and stockholders decided soon after the receivership to place on the market.

## Income Tax Relief Sought on Used Cars

### Indiana Trade Association Also Takes Action on Highway Program

INDIANAPOLIS, Nov. 21.—Federal action permitting automobile dealers to deduct from income taxables the depreciation on used cars was sought by a resolution adopted at the convention of the Indiana Automotive Trade Association convention which was held here. It was the first state convention to take action on the subject and a similar course was urged on other state and local associations. The present income tax law permits deduction of used car depreciation only when the car has actually been sold at a loss.

Another resolution adopted the report of the highway program committee to be presented to state authorities. Specific facts presented show the need of a more permanent road program and the abandonment of gravel for the main intercounty and market highways by Indiana. It calls for immediate action that \$4,500,000 of Federal aid funds still unused be saved for the state by getting all Federal aid projects under construction by next June after which money not so covered reverts to the government. Gravel construction costs \$15,000 per mile, for maintenance. If \$15,000 per mile is spent annually, in 10 years gravel road money would provide a Federal aid hard road to last 20 years.

Officers elected were: president, J. Cooper Props, Muncie; vice-president, M. Johnson, Vincennes; treasurer, R. V. Law, Indianapolis; secretary, Lynn M. Shaw, Indianapolis.

### Taking Steps to Organize Pacific Section of S. A. E.

SAN FRANCISCO, Nov. 19.—A meeting as part of a movement to form a Pacific section of the Society of Automotive Engineers was held here last night at which there were present automobile men, shop foremen, marine engineers, aeronautical engineers and others actively interested in automotive engineering problems. The principal address of the evening was made by F. E. Moskovics, vice-president of the Nordyke & Marmon Co. and a former officer of the society.

The prime movers in the organization of the section are Frank B. Drake of the Johnson Gear Works, A. H. Coates, president of the A. H. Coates Co., and A. H. MacCallum of the S. K. F. Industries.

### STUDENTS INSPECT PLANTS

DETROIT, Nov. 21.—Students of the Michigan State Auto School have been taking advantage of the opportunity to inspect Detroit's big automobile plants in connection with their course of advanced mechanical training here. This

week different contingents of the student body have visited the new Cadillac plant, the Studebaker plant No. 3, the Dodge and the Ford plants. These men have come to Detroit from all over the country and in fact from all over the world, to study automotive mechanics and the automobile business at the center of this great industry.

### Court of Appeals Denies Godsol Commission Claim

BALTIMORE, Nov. 21.—The Maryland Court of Appeals, in an opinion prepared by Judge Thomas, denied the claim of Frank J. Godsol for commissions amounting to \$5,590,970 in a suit brought against the Nash Motors Co. The claim was based on the sale of motor trucks to the United States Government during the war, many of which were used on the battlefields of France.

Godsol's case rested upon a contract entered into on Aug. 3, 1915, for sales made to the American Government. The defendant's claim was upheld in that the sales were not covered by the terms of the contract.

In its decision affirming the lower tribunal's decision, the Court of Appeals points to the fact that the trucks were sold by the manufacturer directly or indirectly to the United States Government, and not for resale in France, and that the several thousand or more trucks sent overseas were for the use of the American army during the war.

### Production by Hendee Continues to Increase

SPRINGFIELD, MASS., Nov. 21.—Hendee Mfg. Co. continues to increase production and is now operating with a force of more than 1000. Ole Bendixen, sales representative for Denmark, with headquarters in Copenhagen, has just paid a visit to the plant and has given a large order for motorcycles for early delivery.

B. R. Hunt, South African representative, arrived a few days ago from Johannesburg and reports good prospects for the coming spring. The two have sailed to attend the motorcycle show in London. Hendee production program calls for 20,000 cycles this season.

### Oregon New Car Trade Improves in October

PORTLAND, ORE., Nov. 21.—Business in the new car field was uniformly better throughout the State of Oregon during October than September. This rather surprising and encouraging situation is shown by the new car license figures for the month.

Further than this, October proved as good, and in some cases better, for new car business than did August. Thus far in November business has been as good as was the case during the first part of October, and indications point to a substantial and steady fall business.

## Metal Trades Show Greater Operations

### Secretary of Association Predicts Return to Normal by Middle of 1922

MILWAUKEE, Nov. 21.—An optimistic report on the business outlook of the metal trades in Milwaukee, among which the automotive industries are prominent, as this is one of the principal sources of parts and equipment in the United States, is given by W. J. Fairbairn, secretary and manager of the Milwaukee Metal Trades and Founders Association.

Within the last thirty days there has been an increase of more than 7 per cent in the number of man-hours worked in the 50 shops embraced by the association. About 11,000 men are employed, compared with 20,000 in normal times. The low point was passed during August when operations were on a basis of 38 per cent of capacity. Now the active ratio is from 45 to 47 per cent. Fairbairn looks for steady improvement, but says this will be more noticeable after Jan. 1 than between now and the end of 1921.

### Wages Decreased

Wages in the metal trades have decreased about 15 per cent. The wage problem, Fairbairn says, is complicated by the fact that the choicest workmen are now left in plants and their efficiency will be greater than the next 10,000 taken on for employment as the industry improves.

"Cycles of trade depression usually run from three to three and one-half years," said Fairbairn. "This was upset to some extent by the war, but this is the normal cycle of trade—about one and one-half years down and the same period needed to get back again. I look for a steady upward trend in activity for the next one and one-half years. The improvement will not be so noticeable before Jan. 1, but orders should increase so that there will be a much better showing by March and April, judging from experience in past years. By the middle of 1923 business should be back close to normal."

Automotive shops, as a rule, have been able to increase operations in November over October, which was slightly under September. December shipment orders are of such volume that the November schedules doubtless will experience a slight increase. In the parts industry the situation is regarded as more promising than it has been since early last spring.

### TO BUILD NEW ROADSTER

TOLEDO, Nov. 21.—The Automotive Corp. states that its new small model roadster will be in production about Jan. 1. The engine will be four-cylinder and air-cooled. The car will weigh 1000 pounds and will have a 48-inch tread and a 95-inch wheelbase. It will sell for \$475. The company was incorporated originally to manufacture tractors but has temporarily left that field.

## States Alter Trucks for Use on Highways

### Change Bodies of Surplus War Material Transferred to Meet New Needs

WASHINGTON, Nov. 23—Approximately 30,000 surplus motor vehicles, inclusive of trucks and automobiles, turned over to the Bureau of Public Roads from the War Department have been transferred to the various state highways. In addition the bureau has taken over from the department spare parts to the value of \$12,000,000.

In the dispute as to legislative action in disposing of this material, either by sales to the public or transfer to the Department of Agriculture for use on highways, the industry has generally taken the position that it would be best to have distribution made immediately. This attitude arose under the assumption that the quick absorption of the material by the state highway departments would hasten the demand for replacement and thus increase the sales of manufacturers and dealers.

#### 22,000 Transferred

In order to protect motor truck and automobile owners and dealers, the authorization for the transfer of this material is given in the Wadsworth-Kahn act which provides that the material shall be used only in the construction and maintenance of roads.

The motor trucks, of which over 22,000 have been transferred, are perhaps the most valuable equipment handed over to the states. As they were received from the Army they were not generally suitable for road construction purposes, on account of the shape and size of their bodies, which were designed especially for Army use. But the states have altered these bodies, in some cases in their own shops built for the purpose, thereby converting the trucks to a number of special uses.

#### Changes Made in Bodies

The majority of the trucks have been changed by substituting dump bodies and hoisting devices for the cargo and ammunition bodies with which they were equipped when received. In some cases new bodies have been built outright; in others the Army bodies have been converted. Idaho, for example, has altered the steel ammunition bodies into hopper bodies by installing false bottoms sloping from front and back to a pair of drop doors for bottom dumping which is controlled from the driver's seat. Maine has removed the cargo body from the chassis and by pivoting it near the rear end and adding a hoisting device has made the Army body into a dump body. The same State and also Vermont have altered the Army bodies by arranging the sides so that they can be dropped or raised, permitting the load to be dumped from the side of the truck.

Arizona sized up the trucks equipped

with steel ordnance bodies and decided that for road work they were too high and not wide enough. To make them suitable they cut the bottoms in half from front to back and then used the sides for a new bottom and the two halves of the bottom for the new sides, thus making the body about twice as wide and half as high. The change makes it easier to shovel into the truck when necessary and also permits the hauling of more bulky material. In addition the trucks have been equipped with hand hoists and offset bars on the rear end in order to pull blades and drags.

In addition to using the trucks for hauling road materials many of them have also been converted to other uses. Army ambulances have needed few alterations to make them admirable survey cars. Nearly all the states in which there is any snow problem at all have utilized a portion of their truck allotment in winter to push snow plows; and one of the other common conversions is that which results in a very serviceable sprinkler truck.

#### Storage Space Provided

Odd but ingenious use has been made by New Jersey of a truck originally intended as a water sprinkler and equipped with a centrifugal pump which was mounted beneath the tank and driven by the propeller shaft. This was changed to a machine for spraying whitewash on poles along the state highways.

Arizona has built a warehouse for the storage of its transferred equipment out of material also received from the Government. The sides of the 50 by 100 foot building are covered with corrugated iron, of which some 5,000 sheets have been distributed by the bureau.

In other states the problem of providing temporary storage space for transferred war material has been solved by the use of the canvas airplane hangars, several hundred of which have been distributed.

## Burt Single Sleeve Valve Engine Introduced Here

INDIANAPOLIS, Nov. 21—Wallace Glasgow, Ltd., the parent licensing company of the Burt (Argyll) single sleeve valve engine, has opened offices in this country with headquarters in Indianapolis. This concern is now endeavoring to interest American manufacturers in the single sleeve engine for motorcycles and other purposes. The preliminary work, however, is being done with motorcycle engines, and sample engines have been under observation by some of the largest motorcycle manufacturers.

The Burt (or Burt-McCullum as it was formerly known) was originally introduced in 1911 and became well known through its use on the Argyll British and the Pic-Pic Swiss cars. The single sleeve has both a reciprocating and an angular rocking motion, which is imparted to it by a small crank on what corresponds to the camshaft in the ordinary engine. The latest design of Burt engine was described in AUTOMOTIVE INDUSTRIES of Dec. 23, 1920.

## Willys Establishes New October Record

### Plan of Distribution Given Credit —400 Dealers Added to Organization

TOLEDO, Nov. 21—Four hundred dealers have recently been added to the Willys-Overland organization under the new plan of that organization practically eliminating distributors.

"Our dealers," John N. Willys, president of the company, says, "have given us concrete evidence of the wisdom of our new sales distribution policy by enabling us to show what appears to be the largest sales last month of any October in our fourteen years in business."

The demand for enclosed cars has been exceptionally good the last few weeks.

Some difficulty has been experienced at the plant, however, in the paint shop. Workmen were given a cut in wages which brought them practically to the pre-war basis of pay. Without any organization they refused to work at the new scale and for the last week the shop has been advertising for high-class painters and finish men.

It is understood that a considerable number of cars are being turned out and sold to dealers unfinished.

The painters objected to the cut largely on the ground that their work was intermittent and that much lost time developed during the month. This is because the factory has been operating close to the margin on orders and inventory.

## Government Will Sell Aeronautical Forgings

WASHINGTON, Nov. 21—Approximately 13,500,000 pounds of aeronautical motor forgings and castings will be sold by the Air Service within a few weeks. Informal bids will be received by the chief of the air service until Dec. 10. The forgings and castings will consist of ferrous and non-ferrous metals.

They are now located at the Long Island Air Reserve Depot, Long Island City, and are to be sold on the basis of scrap metals. The director of sales of the War Department announces that the quantities of metal being offered include 11,534,937 lb. of steel, 1,041,249 lb. of cast iron, 750,000 lb. of bronze, 189,000,022 lb. of aluminum, and 12,707 lb. of brass.

#### ALLEN CLAIMS FILED DEC. 8

COLUMBUS, Nov. 21—Notices have been issued by George A. Archer and William C. Willard, receivers for the Allen Motor Co., that all creditors having claims against the company or its receivers, or agents of either must file them with the receivers by Dec. 8, making proof under oath to the claim. This action is taken by order of the court preparatory to offering the plant and other assets of the company for sale at public auction.

## Ford Will Develop Water Power Plan

### Bids for Muscle Shoals Property Is Indicative of His Purpose

DETROIT, Nov. 21 — Statements made within the past few days by Henry Ford indicate his desire to develop hydro-electric power on a large scale in various sections of the country. This was his purpose when he filed with the Secretary of War his bid for the Muscle Shoals property and it is becoming apparent that it was what he had in mind chiefly when he put through successfully his plan for the development of power by damming the Hudson River at Green Island, near Troy, N. Y. While Ford contemplates the erection of a large plant at Green Island, work now is in progress only on the construction of the hydro-electric power plant.

#### Mississippi Surveyed

Ford has had engineers make a survey for the creation of a great lock system along the upper Mississippi which would provide an enormous amount of power. In this connection he said recently:

"The country is full of unused water power that should be harnessed and put to work. There is a fall of 400 feet in the Mississippi River between St. Louis and New Orleans and not a dam on the river."

He also asserted in a discussion of his plans for Muscle Shoals that:

"If the Government will let me go to work at Muscle Shoals I will establish a great aluminum plant in which aluminum will not only be extracted but manufactured into machinery parts. I will establish plants in which cotton will be spun and woven into cloth. I will put to work every horsepower that I can wring out of Muscle Shoals, no matter how many plants it will take to consume it."

#### Considers Packet Line

It is known that Ford's plans for the development of water power are bound up inextricably with his ideas of farm life in the future when all the arduous work shall be performed by machinery and when social life in the rural districts will be as pleasant and comfortable as in suburban communities.

Another ramification of his water power plan is the development of freight transport on inland waterways. He already is considering a plan to establish a packet line between Ironton, Ohio, and Paducah, Ky., in which a new type of river steamer will be used. These water lines would be operated in conjunction with his railroad properties.

#### WILLYS DEALERS MEET

ATLANTA, Nov. 21—Encouraging reports of Willys-Knight and Overland sales in the Southern field were made by prominent distributors who gathered in Atlanta for the first dealer meeting in

the newly created district of Willys-Overland, Inc., of which Atlanta is the central distributing point.

George DeMack, distributor for the past 10 years at New Orleans, and Gus Johnson, manager of the Jacksonville, Fla., branch, both stated at the meeting that October sales were the largest in their respective territories that they have ever been during this month.

## Utah Coal, Iron and Coke Companies Form Merger

SAN FRANCISCO, Nov. 21—An industrial combination which is of vital interest to the automotive industry, and especially to the automobile, motor truck and tractor manufacturing industry throughout the Pacific slope, has been accomplished here by the merger of the majority of the large coal, iron and coke companies of one entire section of Utah, with the iron and steel plants of California. Hitherto, the steel produced on the Pacific Coast had to be made from scrap iron, owing to the prohibitive rail rates on pig iron, coal and coke from the Pennsylvania production centers.

The new merger makes the Pacific Slope economically independent of these Eastern iron makers and should so cheapen the cost of steel on the Pacific Coast as to make much more attractive the manufacture of automotive vehicles either here or in southern California. The merger, which has been completed and officially announced, starts with a capitalization of \$25,000,000, all paid in, \$10,000,000 representing the value of the plants taken into the combination, and \$15,000,000 to be used for development and expansion.

## Bowlby Chosen to Head American Road Builders

NEW YORK, Nov. 21—The following officers were elected at the annual meeting of the American Road Builders Association held here: President, H. L. Bowlby, chief of the war materials division, U. S. Bureau of Public Roads; vice-presidents, Charles J. Bennett, State Highway Commissioner of Connecticut, New Haven, Conn.; Frank Page, chairman North Carolina State Highway Commission, Raleigh, N. C.; A. R. Hirst, State Highway Engineer of Wisconsin, Madison, Wis.; W. W. Crosby, National Park Service, Estes Park, Col.; secretary, E. L. Powers, editor, *Good Roads*, New York; treasurer, Senator James H. MacDonald, former State Highway Commissioner of Connecticut, New Haven, Conn.

#### BATTERY MEN TO MEET

DETROIT, Nov. 21—Storage battery men in the Detroit metropolitan district will hold an organization meeting on Dec. 8, for the purpose of forming a battery section of the Michigan Automotive Trade Association. A dinner will be tendered the battery men by the big distributors who are fostering the formation of the section to curb abuses which have beset the battery business.

## Success Attending Argentine Exhibit

### Points to Season Exceeding Expectations—American Lines Predominate at Show

BUENOS AIRES, ARGENTINA, Nov. 19 (By Cable)—The first week of the fourth annual Buenos Aires automobile show, which opened here on Nov. 12 and which will continue for another week, has been successful in every way. The local dealers and automotive representatives express themselves as being much encouraged by the success that has attended the showing thus far.

#### Show Unusually Important

Thirty-eight lines are represented in the show, which is held in the spacious Pavilion of the Roses, on one of the city's handsomest boulevards and near the beautiful Palermo Park. Twenty of these lines are American, eight are British and the remaining ten are French, Italian and German. Both 1921 and 1922 models are being shown. The domestic built custom and de luxe bodies are considered as one of the principal features and are attracting considerable attention.

This exhibition is held each year by the Automobile Club of Argentina, with which co-operates the Centro de Importadores de Automoviles y Anexos (Automobile and Accessory Importer's Association) and without doubt it is the largest automobile exhibition held in any part of Latin America. The current show is of more than unusual importance because of the business depression from which Argentina is now emerging and because of the general uncertainty concerning the course that the automotive trade would take for the remainder of this selling season. The success thus far encountered indicates that the season will be better than had been anticipated.

#### Sales Reported Brisk

Trucks, tractors and accessories, including tires, are well represented in the various exhibits in the halls and special exhibit rooms outside of the main floor. Although the show is primarily for the Buenos Aires public, many country dealers are reported to be present and interested in the cheaper models. The sales to the public are stated as being brisk, in some cases at increased prices due to exchange. Some lines have reduced their factory prices sufficiently to overcome the exchange handicap but others have been forced to increase prices.

NEW YORK, Nov. 21—According to the latest mail reports received from Buenos Aires, less than 1,000 cars were held in the custom house on Oct. 1 and more than 500 of these already had been paid for by the dealers. This supply, which consists of a few lines only, it was said then, would scarcely carry the dealers to the new year and that additional shipments probably would be required within a short time.

## Ford Shows Steady Export Improvement

### Better Sales Are Maintained in All Centers with Assembly Branches

DETROIT, Nov. 21—Steady improvement is being shown in the export business of the Ford Motor Co. and improved sales are reported from every center in which the company maintains foreign assembly branches. A statement on this point from the company shows that the export sales have reached an appreciable volume from the plants at Manchester, Copenhagen, Buenos Aires, and elsewhere. In addition, sales in Mexico are continuing on a level approximate with general business conditions in the United States and large shipments into that country are being made each month from the assembly plant at Houston, Texas.

#### Copenhagen at 100 Per Cent

In South America, the Buenos Aires assembly branch distributed 1650 cars in October in the Argentine, a number that will be equalled and probably exceeded in November. Sao Paulo, the assembly branch for Brazil, is operating on a smaller schedule than its southern neighbor but is showing steady improvement. This plant has about half the capacity of the Argentine branch. Other South American points are covered by direct shipment from New York and are steadily extending their demand for cars.

In Europe the Copenhagen plant which shipped about 700 cars in October is declared by Ford officials to be operating at almost 100 per cent. The output of the Copenhagen plant is absorbed in its entirety by the Scandinavian countries. These being neutral nations in the World War, their business is again close to normal proportions.

#### Continental Plants Gain

The Manchester, Eng., plant producing Ford cars, unlike the branches in other countries, is a manufacturing company, making approximately 80 per cent of the complete car. This business has shown large gains in recent months and is now on a basis of about 100 cars a day, these being sold in the British Isles exclusively. Continuation of increased buying in England, Ireland and Scotland is regarded as certain.

The Cadiz and Bordeaux assembly plants, which supply most of the other nations of Continental Europe, are operating on a reduced schedule, the company declining figures, but even here recent gains are reported. There is every intention on the part of the Ford company of locating a plant in Germany as soon as the situation is regarded as favorable. There is no direct business with Russia.

Ford Motor Co. of Canada, Ltd., which handles all Ford business in Canada and all British possessions aside from the British Isles, is operating on a

four-day week schedule, whereas the Detroit plant is maintaining five-day operation. Canadian business has fallen off considerably with the approach of winter and will be further reduced as the northern winter sets in.

Shipments to South Africa and Australia are increasing in comparison to recent months. No figures are obtainable on these, but officials are satisfied that the end of the depression in these countries is at hand and that business will make steady advances from this time on. Business in the Far East, which has been dormant for many months, continues slow, but favorable sales movement is reported.

## Pennsylvania Changes Truck Classification

HARRISBURG, Nov. 21—Changes in the classification of trucks with reference to chassis weights, fees, and maximum over-all weights allowed, are presented in the following table prepared by the automobile division of the State Highway Department:

Class	Chassis Weight	Pneumatic Tire Fee	Solid Tire Fee	Max. Cap.
AA	2,000-2,999	\$24	\$30	7,000
A	3,000-3,999	32	40	11,000
B	4,000-4,999	40	50	13,000
C	5,000-5,999	56	70	18,000
D	6,000-7,499	80	100	22,000
E	7,500-8,499	100	125	25,000
F	8,500 and over	140	200	26,000

Trucks having chassis weight of less than 2000 lb. are registered on the basis of horsepower rating, with minimum fee of \$15. A truck-tractor with semi-trailer attachment is registered as one vehicle with fee computed according to table of weight and the fees specified for trucks and upon the basis of the chassis weight of the tractor, plus the weight of the attachment. The fee for registration of any trailer with metal tires is double the regular fee for trailers.

## Olds Dealers Predict More Sales in South

MACON, GA., Nov. 27—A rapid return to normal financial conditions throughout the South with a steadily increasing volume of sales of passenger cars and trucks was predicted by Oldsmobile dealers of Georgia and other Southeastern States attending a special meeting here. A. B. C. Hardy, president of the Olds Motor Works, and Guy H. Peasley, general sales manager, attended the meeting explaining the company's business plans for the coming year and describing the 1922 models.

#### JERSEY CITY HOLDS SHOW

JERSEY CITY, Nov. 21—The second annual automobile show of the Hudson County Automotive Trade Association, which closed here to-day marks the opening of the 1921-1922 show season. A hearty reception was accorded it and the results obtained present a very optimistic outlook.

## Creditors Present Plan for Obenberger

### Bank Officers to Accept Second Mortgage Bonds to Settle Claims

MILWAUKEE, Nov. 21—The reorganization of the defunct John Obenberger Forge Co. of Milwaukee under the name of United States Forge Co., is set forth in a plan presented to the referee in bankruptcy by a committee of the principal creditors. The Obenberger company failed in December, 1920, with liabilities of \$858,972 and assets of \$1,778,329. The plant has been in operation for the last four months under the direction of the trustee, J. Frank Gerdis, previously secretary of the creditors' committee.

The reorganization plan is proposed by Walter Kasten, first vice-president of the First Wisconsin National Bank; Theodore Trecker, president of the Kearney & Trecker Corp., milling machines, and W. F. Kinsella, vice-president of the Worden-Allen Co., a large bridge and iron works concern of Milwaukee. It is proposed to issue \$350,000 of 10-year, 6 per cent first mortgage bonds; \$300,000 of 15-year, 6½ per cent second mortgage bonds; \$375,000 of 7 per cent cumulative preferred stock, and 500,500 shares of common stock without par value.

#### Referee Considers Proposition

The First Wisconsin National Bank offers to accept the second mortgage bonds in full settlement of claims. The preferred stock is to be given to unsecured creditors and holders of preferred stock of the Obenberger company. The common stock issue is designed as a bonus to purchasers of the first mortgage bonds and would be used to pay the expense of reorganization. Secured creditors would receive \$100,000 of first mortgage bonds, the remaining \$250,000 to be sold. Each purchaser of a \$100 bond would receive one share of common stock as a bonus. Owners of preferred stock would receive one share of preferred for each share, provided that they bought first mortgage bonds equivalent to the par value of their stock.

The proposal says that the net tangible assets of the United States Forge Co. would be \$1,170,000 and its net quick assets \$539,000.

The referee in bankruptcy has taken the proposition under consideration and expects to make a decision shortly.

#### RECEIVER FOR RUBBER PRODUCTS

NEW HAVEN, Nov. 21—Ernest J. Spitzer of Derby has been appointed temporary receiver of the Rubber Products Corporation upon application of the Ousatonic Water Power Co. by Judge Keeler of Supreme Court. His bond has been fixed at \$10,000. The receiver has been directed to continue the business for one month.

## Gordon Lee Visiting Automotive Centers

### Government Official Starts on Tour That Will Cover Country

NEW YORK, Nov. 22—Gordon Lee, chief of the automotive division of the Bureau of Foreign and Domestic Commerce, reached New York City to-day on the first leg of a tour that will take him to the principal automotive manufacturing centers of the United States and on which he will discuss with many executives of the industry the future of foreign sales.

Lee is getting under way the co-operative work that this new division of Secretary Hoover's department has outlined, and his trip is to further this work, explaining it to the industry so that the fullest measure of assistance may be accorded to passenger car, truck, equipment and airplane makers.

While in New York, in addition to meeting company executives, Lee will confer with representatives of the National Automobile Chamber of Commerce, the Motor and Accessory Manufacturers Association, the Society of Automotive Engineers and the Manufacturers Aircraft Association. The purpose of these meetings is to form contact with these associations and to formulate policies of work contemplated. For instance, it is hoped that the S. A. E. will see fit to work with the division regarding the standardization of spare parts so that the service effort in the foreign field will be reduced to a minimum.

Lee's program follows:

Nov. 25, Rochester; Nov. 26, Buffalo; Dec. 2, Detroit, addressing the Motor Truck Sales Managers Association at Hotel Statler before returning to Washington; Dec. 13, Toledo; Dec. 13-18, Detroit; Dec. 19, Flint; Dec. 20, Lansing; Dec. 21, South Bend, and Dec. 22, Indianapolis.

Lee will be joined on this trip by William Irvine, also of the automotive division, who will leave the United States early next year for a trip of investigation through the Far East.

## Efficiency and Economy Stressed in Bank Review

NEW YORK, Nov. 21—Business is better and sentiment throughout the country reflects courage, according to the review of business conditions for November issued by the National Bank of Commerce, one of the largest in New York. In discussing the business and credit situation the bank says:

"Such progress as has been made by the business community toward normal conditions results from a realization that artificial levels of activity will not again be reached in any period near enough to affect the problems of to-day, and from a determination to practice economies of operation more

rigid than heretofore thought possible. The need of personal effort and economy is also being increasingly recognized in giving a day's work for a day's pay and in care as to personal expenditure. Business men and executives now recognize that henceforth they must give the most thorough personal attention and application to their enterprises.

"Some part of the recent gain in business is unquestionably a result of seasonal demand. Permanent improvement depends to a large extent on foreign buying power, and even more on the adjustment of conditions under which the farmer operates. The last three years have clearly shown that the European situation can be stabilized only by the political and economic efforts of the countries concerned. Domestic conditions can be bettered by steady determination on the part of corporations and individuals to secure greater efficiency and to practice greater economy."

## Oakland Will Continue Present Line for 1922

NEW YORK, Nov. 21—A statement asserting that the present Oakland line, "with gradual improvements," will be continued for the 1922 selling season, has been issued by P. S. duPont, president of General Motors Corp. His statement follows:

"It is but natural that there should have been constant gossip during the past few weeks while automobile price revisions were under way. The policies of General Motors Corp. with respect to certain of its manufacturing divisions were not immune, the future of Oakland being the subject of persistent rumors.

"This division is in a healthy condition, with its business stabilized and sales increasing. The present line of passenger cars, with gradual improvements, will be continued for the 1922 selling season. Thereafter, new models as may be required by the trade may be introduced."

## Van Briggle Is Given Four Year Sentence

INDIANAPOLIS, Nov. 21—L. H. Van Briggle, former president of the Van Briggle Motor Devices Co., and Henry Rominger, former treasurer, were sentenced to Federal Prison for four years and for eighteen months respectively by Judge A. B. Anderson in the Federal Court. In addition, Van Briggle is to pay a fine of \$1,000 and Rominger \$500.

Both officials were indicted for the misuse of the mails and retracted their pleas of not guilty when the case was called for trial. Sentence was postponed at the time to permit Van Briggle to arrange his personal affairs.

## NEW YORK WANTS BUSES

NEW YORK, Nov. 22—Mayor Hylan announced at a conference of city department heads, called to consider amendments to existing laws to be presented at the next session of the State Legislature, that the city would ask the Legislature again for authority to operate buses. "We are prepared to spend \$10,000,000 in the purchase of well lighted, comfortable and well ventilated buses," he said.

## Vacates Injunction Against Adria Motors

### Trial Suggested by Court in Action Brought by Parenti Corporation

BATAVIA, N. Y., Nov. 21—Justice Harry L. Taylor of the New York State Supreme Court has handed down a decision vacating an injunction obtained by the Parenti Motors Corp. against the Adria Motor Car Corp. restraining the defendant from making automobiles which, it was alleged, imitated the Parenti car. The court holds that the merits of the case can soon be determined in a trial on its merits, "a method of quieting controversy far more satisfactory than that furnished by an order based on affidavits and pleadings."

In the argument on the injunction, Louis F. Vremsak, president of the Adria company, claimed that Parenti entered his employ in 1911 as a workman with no knowledge of automobile construction and that it "required painstaking effort to make of him a workman even of average ability."

### Some Ideas Similar

In his decision Justice Taylor stated that Parenti evidently had indulged in much experimentation in endeavoring to produce a more satisfactory automobile. In his discussion of the case he said:

"It is quite possible that some of the ideas of Parenti and some of those ideas which have controlled the defendants in their conception and construction of the Adria car have been similar. It is also quite possible that the defendants have received inspiration from their former association with Parenti and vice versa. However, the injunction order as it stands is prolix in preliminary recitals, some of which are unwarranted.

"It is conceded upon the argument, for example, that the defendants are not offending in respect to the steering gear. In fact, it is somewhat difficult to determine from the affidavits and an examination of the drawings just what features of the Parenti car, which are really novel, have been or are being copied or imitated by the defendants; nor is the mind of the court led at all satisfactorily to the conclusion that the defendants have been or are offending in any of the material respects claimed."

The Adria corporation asserts that two models, a five-passenger touring car and five-passenger sedan, selling at \$1,395 and \$1,995 respectively, are being produced. The car will be marketed in Ohio by the Ohio Adria Motor Car Co., which is headed by A. W. Green, president of the Supreme Motors Corp.

## DROPS MILEAGE GUARANTEE

CHICAGO, Nov. 21—The Mid-West Rubber Association, following the lead of the Rubber Association of America, at its last monthly meeting in Chicago decided to eliminate the tire mileage guarantee and to make all adjustments hereafter on the basis of defects in workmanship and material.

## California Builds Longest Test Road

### Thorough Experiments Are Made of Concrete Road Reinforced with Steel

SAN FRANCISCO, Nov. 21 — The longest and most expensive experiment in road building ever undertaken in the United States is now going on at Pittsburg, a few miles northeast of this city, under the auspices of the California State Automobile Association, with highway engineers from 17 States, nearly a score of army engineers, and road-building experts from all sections of the Pacific Slope on the ground to watch the tests and note the results.

#### Steel Company Interested

A test highway, oval and one-quarter of a mile in length, has been constructed by the Columbia Steel Co. of Pittsburg, Cal. This highway, which is 18 feet wide, is all concrete, but of 13 sections of widely varying types of construction, the thickness of the slabs varying from five to eight inches. The basis of the entire track, however, is adobe, that yellow mud which rivals southern gumbo in offering obstacles to the road-builder, yet the most common of all the basic materials encountered by the road builder in California.

Under each section of this highway, which is announced as costing approximately \$50,000, observation tunnels have been constructed, and alongside are ditches which can be filled with water, so that the foundation of the road can be soaked to varying degrees in the different sections of the various materials. Instruments to record flexure caused by the loads on the top of the pavement have been installed in each of these tunnels.

#### Government Lends Trucks

The Federal Government has loaned 40 motor trucks ranging from 1½ to 5 tons, which are being driven constantly, night and day, around this track, all loaded to capacity, some in one direction and some in the other. This driving will be continued until the road has been destroyed. Records are being kept of the wear, resistance and endurance of each section, and, as soon as a section gives away, it will be repaired, so that the most enduring of all the sections may have full share of the wear and tear, the same as the weakest section, and the entire road remain usable until the last unit gives way. It is estimated that each section will bear the passage of 3000 to 4000 heavily loaded trucks every day, and the test, in addition to proving the various forms of concrete construction, will demonstrate the best method of repairing concrete roads for heavy traffic.

In case any section fails to yield to the truck traffic, the War Department has agreed to put heavy tractors, motor gun carriages and the new army tractor,

weighing 28 tons and running at 25 miles an hour, over the road until it gives way under the strain. Close records are being kept, and the result should be a volume of invaluable data to all builders of concrete roads. The surface of the highway has been marked off into six-foot squares, and a separate record of each square, all of which are numbered, is kept so that the progress of cracks may be recorded, the spreading of small holes ascertained and all such detailed data kept in complete form.

#### Engineers Consulted

Before building this highway a questionnaire was sent to the highway engineer of each State, asking his views as to what forms of concrete highway construction should be included in the test. Federal engineers also were consulted, and the thirteen types of highway were selected for sectional demonstration.

Though the experimental track was constructed and the main burden of costs borne by the steel company, the road was laid under the complete supervision of engineers from the State Highway Department, and from the California State Automobile Association. The object of the Columbia Steel Co. in making this costly experiment is the demonstration, as one of the sections, of a reinforced concrete form of highway, devised by its engineers. One-quarter and three-eighths inch steel is used in this reinforcing, which makes of the highway virtually one side of a skyscraper, laid on the ground.

## Uniform Car Taxes Probable for Philippines

LOS ANGELES, Nov. 21 — Indications are that the fight that has long been waged by the automobile interests in the Philippine Islands for a uniform tax throughout the islands on motor vehicles will be crowned with success at an early date when the legislature tackles the tax question.

The newspapers in the islands have taken up the cry of the dealers that the automobile is an absolute necessity for the Philippines and that there is no use taking chances of injuring the industry by leaving the taxation question at the mercy of every municipal council.

The danger is illustrated by the trouble encountered in Manila where the municipal board has been determined to pass a heavy automobile tax ordinance irrespective of the insular tax.

"Some people argue that the automobile owner is more able to pay taxes than are other persons, as a general rule, and that therefore it is fitting and proper to go at it with vim and vigor," says an editorial in the *Manila Bulletin*.

"It should be remembered that the automobile owner already is paying the bulk of the taxes and there is a limit to jabbing him even though he does arouse the envy of some who are not able to ride in attractive cars. Let the tax be reasonable and uniform; let the automobile pay only its share of the taxes; let the motor industry be recognized as a vital part of our commercial life."

## Exhibit at Olympia Is Dealer Success

### Optimism Spreads to Makers and Public—Proves Popular Price Show

LONDON, Nov. 11 (*By Mail*)—The result of the 1921 automobile show, now nearing its close, has been as successful as it was unexpected. A fortnight ago manufacturers and dealers alike were discussing in dismal tones the prospects of the show and the 1922 season. Some firms would have welcomed a cancellation of the event until the declared restoration of other industries on which the car trade depends. The only factor favorable to the situation was the comparatively mild weather and the consequent prolongation of the touring season.

#### Public Cautious

Contrary to all expectations, however, the tone early became buoyant and orders began to be offered by the dealers. Their optimism spread to the makers. The formal opening day found the public interested but cautious. Even now it would be too much to say that the public or private buyer has bought freely. It is true, rather, that the dealers have filled the void and correspondingly both ensured a success to the show and the handling of next season's business through their class. The show is essentially a dealer's success and reflects more the unexpected optimism of dealers than the attractive program of the makers.

Moreover, it has been a popular-price show; cars of £300 to £450 having vastly the monopoly of interest to the public as buyers. The interest of both dealers and public centers in the small new-comers or runabouts.

#### Will Reduce Capital

There remains, however, the problem of the ways and means of the industry during the coming season or until production has well begun. The industry suffers from a legacy of the after-war boom months, 1919, to the early months of 1920. There is scarcely a company that has not to regret having greatly increased its capital, and to-day this item is reckoned in millions of dollars when before the war it seldom exceeded a million.

It is likely that this excessive capital will be reduced, because of the need to get prices back to something like the pre-war level, if only to re-establish the export trade. Allied with this aspect is the all-important factor of financing production to cope with the orders placed at the show.

#### MILBURN TO MAKE NEW TRUCK

TOLEDO, Nov. 22 — The Milburn Wagon Co. has announced that it soon will place on the market a new model electric truck. More men are being added to the working force.

## S. A. E. Will Launch Aviation Campaign

Existing False Impressions Will  
Be Dissipated at Country  
Wide Meetings

NEW YORK, Nov. 21—The Society of Automotive Engineers will open a campaign the first of December and continue it through the month with the aim of showing to the public the truth about commercial aviation and dissipating many of the false impressions now existing. The plans of the society include meetings at nearly a dozen cities in widely separated sections of the country.

### Will Review Situation

The speakers will include Admiral Moffett, head of the Navy Air Service; J. G. Vincent, vice-president in charge of engineering of the Packard Motor Car Co. and a past president of the Society; Glenn L. Martin, one of the pioneers in aviation and manufacturer in Cleveland of the Martin bombs; Ralph Upson, balloon expert, and Assistant Postmaster General Shaughnessy, who has charge of the air mail service for the Government.

These speakers will tell what has actually been done both in this country and in Europe in the way of commercial aviation, citing authoritative figures to show the number of planes now in operation, the number of miles flown during the past year, the percentage of successful flights and the number of accidents to planes attending to business, as contrasted with the much greater losses caused by spectacular flights or through the use of imperfectly designed machines or the operation of planes by insufficiently trained pilots.

The cost of aerial transport per passenger-mile and per ton-mile will be given, the figures being obtained from flights that have been actually made on regular schedules.

### Free Discussions at Meetings

A number of the problems still to be solved will also be discussed freely at the meetings. Subjects that will receive attention in this connection are airways, landing fields, ground organization, legal aspects, radio and meteorological service and the relation of civil aviation to national defense. Moving pictures will be shown of the recent aerial bombing operations against the surrendered German battleships.

All meetings will be thrown open to the public, which includes laymen interested in aircraft.

The first meeting will be held Dec. 1 at St. Louis when Vincent will be the principal speaker. Indianapolis follows on Dec. 5 and Worcester on Dec. 9. Admiral Moffett has been invited to address the New York City meeting on Dec. 15. Martin will speak at Cleveland on Dec. 16, and Upson and Shaughnessy at Philadelphia on Dec. 22. Other meet-

## EXPRESS EXECUTIVE LAUDS MOTOR TRUCKS

NEW YORK, Nov. 18 — The following statement in reference to the value of the motor truck in commerce has been made by R. E. M. Cowie, vice-president of the American Railway Express Co.:

"The value of the motor vehicle as a means of transportation cannot be overestimated; the things that it has accomplished even thus far are marvelous in the extreme. From an experience of a great many years, with all types of transportation, I have come to the conclusion that there is very much of a distinct place for the motor vehicle, propelled by either electricity or gasoline.

"Until a few years ago the express traffic of the country was conducted very largely by horses and wagons, which are in these days regarded as a slow and tedious means of transport. It is very unfortunate that horse-drawn vehicles and motor vehicles have to operate on the same highways, because the horse-drawn vehicle is very apt to keep the speed of the traffic strained back, recognizing the theory that the speed of your fleet is the speed of the slowest collier in your fleet."

ings, for which definite dates have not been fixed, will be held during the month at Cincinnati, San Francisco, Buffalo and Detroit.

## Farm Lighting Discussed by New England S. A. E.

SPRINGFIELD, MASS., Nov. 21—During the meeting here of the New England section of the Society of Automotive Engineers an inspection of the American Bosch Magneto Corp.'s plant was made.

Following a banquet at Hotel Kimball in the evening, E. B. Newill, engineer in charge of the isolated electric lighting plant section of the Westinghouse company in Pittsburgh, read a paper dealing with farm lighting plants. He described the improvements made in the construction of such plants and their increased importance in the economy of farm management.

### TO CHANGE OHIO THEFT LAW

COLUMBUS, Nov. 21—Steps are being taken by officials of Franklin County and the Ohio Automobile Association to make necessary changes to the Atwood anti-theft law which, it is hoped, will still further reduce the thefts of cars. It is suggested that bills of sale should contain the names of the seller and buyer as well as make of cars and the engine numbers. At present only the name of the buyer appears.

## Townsend to Renew Excise Tax Efforts

Will Carry Fight for Its Removal  
into Next Session of  
Congress

WASHINGTON, Nov. 23 — Senator Townsend of Michigan told AUTOMOTIVE INDUSTRIES to-day that he intended to carry the fight for the removal of the excise tax on automobiles into the next session. The passage of the tax measure retaining the excise tax on automobiles and trucks was a keen disappointment to the Michigan Senator, who had waged an aggressive, though unsuccessful battle against it. He is firmly convinced that it will be necessary within the next year to revise the tax bill as it passed the Congress, because of its inequities.

With price reductions common throughout the industry on practically all makes of cars and trucks, the tax item is an important factor in the situation. Senator Townsend feels that the conference on the limitation of armaments will have much to do with the removal of the excise tax. This belief is founded upon the fact that the larger proportion of the annual Federal appropriations are used in the maintenance of the military and naval establishment. The reduction of naval forces and the suspension of battleship construction would effect an enormous saving in expenditures, and, as a consequence, would reduce the need for taxes.

Senator Townsend is of the opinion that the economies resulting from this international action will lessen the opposition to the removal of excise tax. In his efforts to have the tax removed at the special session, he found that the principal opposition was to the elimination of this revenue.

## University Inaugurates Tractor Repair Schools

BERKELEY, Nov. 21—The University of California has inaugurated tractor repair schools throughout the State, to be maintained in operation every day in the year except Sundays and national holidays, under the direction of the College of Agriculture. Actual repair work is done by the students, and there are no fixed hours for attendance, so as not to prevent men at work in the fields and especially farmers owning tractors, or their sons, from attending whenever it is most convenient for them.

Each school will have a competent repair man in charge, and three tractor experts from the agricultural engineering division of the University of California will spend their time from now on traveling from school to school, installing the repair plants and getting the teachers started. A nominal enrollment fee, to cover costs, is the only charge connected with these schools, and the students may remain enrolled as long as he likes.

## Fisk Reduces Prices on Tires and Tubes

### Other Companies Revise Lists, Goodyear Including All Lines for Trucks

CHICOPEE FALLS, Nov. 21—The Fisk Rubber Co. has reduced its prices of tires and tubes 10 per cent. to \$3 1/3 per cent under previous schedules. A 30 x 3 1/2 fabric casing now lists at \$10.85, as compared with the previous price of \$14.50, and \$18.50 in November, 1920. The 34x4 cord casing at \$32.50 compares with \$48.95 previously, and \$55.30 a year ago.

### Truck Tire Prices Cut

AKRON, Nov. 21—The Goodyear Tire & Rubber Co. has cut motor truck tire prices, following the company's recent slash of automobile tire prices. The reductions average 15 per cent on all diamond tread solid tires, 10 per cent on pneumatic truck tires, 10 and 15 per cent on pneumatic truck tubes, 6 per cent on smooth solid tires and 10 per cent on cushion truck tires.

### Michelin Reduces Prices

MILLTOWN, N. J., Nov. 21—The Michelin Tire Co. has reduced the price of its oversize cord tires up to 4 1/2 in. sizes about 10 per cent. and its regular cords of all sizes between 6 and 12 per cent. A reduction has also been made of between 2 and 7 per cent on all fabrics.

### New Prices for McGraw

CLEVELAND, Nov. 21—The McGraw Tire & Rubber Co. following the action of other manufacturers has made a reduction of from 6 to 14 per cent on its fabric tires and from 12 to 28 per cent on its cords.

### Republic Revises Lists

NEW YORK, Nov. 21—Republic Rubber Co. announces that it has revised its price lists to be in accord practically with the general revisions in pneumatics now being put into effect by other tire manufacturers.

### Mohawk Tires Lower

AKRON, Nov. 21—The Mohawk Rubber Co. has announced a reduction of between 17 and 24 per cent on its cord tires; 10 and 20 per cent on its fabric tires and about 13 per cent on its tubes.

### American Tire Reduced

NILES, OHIO, Nov. 21—Effective immediately, the American Tire Corp. has made a downward revision of its prices as follows: On fabrics, 14 to 19 per cent; cords, 15 to 32 per cent; tubes, 12 to 18 per cent.

### NEW DIXIE FLYER PRICES

LOUISVILLE, KY., Nov. 21—Kentucky Wagon Mfg. Co. has made a down-

ward revision in the prices of the Dixie Flyer as follows:

	Old Price	New Price
Touring Car.....	\$1,345	\$1,195
Roadster .....	1,345	1,195
Speedster .....	1,545	1,395
Sport Touring.....	1,545	1,395
Sedan .....	1,995	1,895
Coupe .....	1,995	1,895

### ROMER DOWN

BOSTON, Nov. 22—The Romer Motors Corp. has announced a reduction in price on its models as follows:

	Old Price	New Price
Roadster .....	\$2,000	\$1,975
5 passenger touring..	2,000	1,975
7 passenger touring..	2,100	2,060
Coupe .....	2,450	2,400
Sedan .....	2,750	2,700

### CASE REDUCED

RACINE, WIS., Nov. 21—The J. I. Case Threshing Machine Co., announces a price reduction on its four and seven passenger cars from \$2,250 to \$1,935 and on its sedan from \$3,285 to \$2,970.

### VICTOR PRICES REVISED

SPRINGFIELD, OHIO, Nov. 23—The Victor Rubber Co. has reduced its prices on cord tires 30 per cent and on fabric, 22 per cent. Prices have been reduced from 3 to 10 per cent on tubes.

## Republic Arranges for Note Extensions

NEW YORK, Nov. 23—The Republic Motor Truck Co. has completed arrangements for the deposit and extension of \$2,500,000 7 per cent mortgage notes outstanding by which the corporation would increase the rate to 8 per cent and agree to redeem \$300,000 worth of the notes annually, beginning Nov. 1, 1923. The plan contemplates a five-year extension of the notes, \$500,000 of which was due on Nov. 1. The remainder mature serially during the next two years.

## Durant Motors of Indiana Completes Organization

NEW YORK, Nov. 23—The organization of the Durant Motor Car Co. of Indiana has been completed by the election of Hal W. Alger of Chicago as first vice-president in charge of sales and A. Henniger, who has been a member of the T. W. Warner organization, as second vice-president in charge of production. The other officers are: President, W. R. Willett; secretary, H. M. Herbermann; treasurer, C. F. Daly. Besides the officers the directors include T. W. Warner as chairman of the board, W. C. Durant and C. O. Miniger.

### QUALITY STILL DOWN

ANDERSON, IND., Nov. 21—The Quality Tire Mfg. Co., a \$200,000 corporation that went into the hands of a receiver three weeks ago, is still inactive. Present indications are that it will be the middle of winter at least before definite action can be taken by the receiver.

## Lincoln Receiver Resumes Operations

### Question of Taxation Figures in Reorganization Plans of Company

DETROIT, Nov. 22—Manufacture of cars has been resumed at the plant of the Lincoln Motor Co. by the Detroit Trust Co., the receiver, upon completion of the physical inventory. Shipments for the month of November are expected to run about 100 cars and operations, pending final reorganization, will be conducted strictly on a sales basis. Details of the inventory are not available. The work of pricing the equipment and material at figures which the receiver considers fair is now in progress. An announcement on this subject is expected within a week.

There are several important points upon which reorganization plans hinge. One of them is a question of taxation which the receiver and attorneys for the company have taken up with the Federal Government at Washington and which is now under consideration.

Operations at the plant for the present will consist mainly of completion of cars which were in process at the time the receivership action was taken and which were held up pending the inventory. Dealers and distributors are placing orders, and the receiver reports approximately 100 since the court action was taken.

A stockholders' protective committee has been formed by the owners of Class A stock and steps are now being taken for the organization of a merchandise creditors' committee.

There has been much speculation as to the nature of the reorganization which is contemplated, but definite information on this subject is lacking. It is considered possible that the assets will be offered for sale and bid in by the interests now in control of the company.

### SUIT RESULTS FROM FIRE

EDGERTON, WIS., Nov. 21—The Highway Trailer Co. has brought suit against the Janesville Electric Co., Janesville, Wis., to recover \$250,000 damages growing out of the destruction of the main factory building on the night of July 4. It alleges that the electric company hampered the fire department by shutting off the power operating an electric pump, thus permitting the loss to grow beyond reasonable proportions. The loss was \$360,000, with insurance of \$100,000.

### RAILWAY ORDERS TRUCKS

ROCKFORD, ILL., Nov. 21—Orders have been placed by the Rockford City Traction Co. for six White motor truck chassis, which will be equipped with bus bodies, delivery to be made on Jan. 15. The cost will be \$42,000. These buses will be operated by the street car company as feeders to the trolley lines.

## Reduced Car Taxes Sought by Japanese

### Use of Automobiles Curtailed as Protest Against Existing High Rates

LOS ANGELES, Nov. 21—A determined fight has been launched by automobile dealers and automobile owners in Japan under the leadership of Toshio Fujiwara, president of the Naigai Kogyo Kaisha, Ltd., one of the foremost figures in automotive circles there, to obtain a reduction of the automobile tax now in force in Tokio, which is regarded as the highest tax of its kind in the world. The automobile taxes of other Japanese cities were also increased some time ago and are about as heavy as those imposed in Tokio.

#### Trade Is at Standstill

Information received here is to the effect that a few weeks ago the leading automobile dealers of Tokio presented a petition to the governor of Tokio, the mayor of Tokio, the prefectural assembly of Tokio and the municipal council of Tokio, in which relief from the prohibitive taxes was demanded. The petitioners asked the authorities for a reduction of the present tax to less than one-fifth, and further reductions on the rates on trucks and cars for hire to less than one-half of the rates reduced as recommended first.

Indications are that the campaign launched by the dealers and owners will bear fruit, as the automobile situation in Tokio, the automotive center of the Nipponese Empire, has been at a virtual standstill since the high taxes were levied some months ago.

#### Automobile Use Discontinued

When the automobile tax was first established in Tokio some years ago, it was 20 yen per car or truck, without regard to its horse power. Since then the rates have been revised several times, and last year they were raised so high that the tax on an automobile of 20 horsepower or more, including additional taxes, is 843 yen a year, and that on an automobile of 15 horsepower more than 590 yen a year. Such high rates of taxation put Japanese people connected with the automobile business in a very difficult position, and the users of automobiles are disgruntled at the attitude of the authorities concerned. Many of them have discontinued using automobiles to voice their protest.

As a matter of fact, at the time the new rates of taxation were put into effect last April, the owners of 507 automobiles in Tokio discontinued their use and since then 300 more have followed their example, according to figures compiled by Fujiwara. Over 25 per cent of the total number of taxable automobiles and trucks have disappeared from the streets in this way during the year.

"If the object of the authorities concerned is to prohibit the use of automobiles by

imposing high rates of taxation it has been partially accomplished," Fujiwara is quoted as stating. "In other countries the number of automobiles in use is regarded as a barometer of the standard of that country's civilization. It is to be sincerely regretted that the use of automobiles is discouraged in Tokio by this heavy tax.

"Supposing that a healthy man weighs about 125 pounds in average, and that his weight has suddenly decreased by 25 pounds, he must be regarded as in an unhealthy condition, and even may be on his deathbed. The same may be said of the condition of automobile utility in Tokio, where about 25 per cent of the automobiles operating have disappeared in a few months on account of the ridiculous tax. The automobile business in Tokio is, so to speak, in an unhealthy condition.

"The present movement, started by the automobile dealers, is to cure this unhealthy situation."

## Gasoline Consumption Declines in September

WASHINGTON, Nov. 21—The domestic consumption of gasoline fell off by 65,000,000 gal. for September and production declined by approximately 25,000 gal. a day, as compared with August. Stocks of gasoline on hand at refineries on Sept. 30 decreased by 52,000,000 gal. Exports also fell in line and decreased by nearly 13,000,000 gal., as compared with those of the preceding month. Shipments of gasoline to insular possessions, however, more than doubled. According to the statistics prepared by the Bureau of Mines, the production of gasoline for the first nine months of 1921 increased by 10 per cent over the production for the same period in 1920; imports of gasoline were decreased 17 per cent, exports decreased 15 per cent, shipments to the insular possessions gained 33 per cent, while the domestic consumption increased 6 per cent.

The daily average production of lubricating oils for September was 157,000 gal. larger than the production for the month of August. Stocks were decreased 12,300,000 gal. during the month. For the first nine months of 1921, the production of lubricating oils shows a decrease of 17 per cent; exports a loss of 35 per cent; shipments to insular possessions a decrease of 1 per cent, and domestic consumption a decrease of 21 per cent.

## California Governor Upholds Road Methods

SAN FRANCISCO, Nov. 21—Governor William D. Stephens has taken a firm, and apparently immovable, stand back of the California State Highway Commission, in the controversy which the California State Automobile Association and the Southern California Automobile Club raised by their criticism of methods of road construction and use of State funds in that work.

Responsibility for the alleged inadequate road building policy of the State was placed on Governor Stephens by the California State Automobile Association.

## METAL MARKETS

While the market for automotive steels is seasonably quiet, sufficient activity is in evidence, either by way of actual buying or tentative inquiries, to raise high steel producers' hopes for a steadily growing volume of business from the automotive industries, once the preliminaries for the season of 1922 get under way. In connection with these expectations the trade considers it as a good omen that stress is laid upon the relatively large amount of steel entering into garage construction at this time.

The alloy steel market, following a period of protracted idleness, seems to have taken on a new lease of life as the result of orders for a few hundred tons placed by passenger car builders and automotive specialty manufacturers. Quotations named by alloy steel specialists denote somewhat higher asking levels, but a survey of that branch of the steel industry shows that anxiety of producers to get really worth while orders on their books is sufficiently to the front to warrant confidence on the part of purchasing agents in their ability to secure all possible concessions within reason through individual negotiations.

Of course, the markets for nickel, chromium, vanadium and the other alloys, for many months in the doldrums, are certain to respond sooner or later to what increased demand will make itself felt as the result of a broadened demand for alloy steels from the automotive industries. In the sheet market, there have been rumors of quotations of as low as 4.00¢ for 22-gage full finished body sheets. Undoubtedly there have been attempts here and there to find out whether a concession of \$5 to \$7 a ton from the 4.35¢ price that has heretofore prevailed would bring out a worth while quota of orders.

The bulk of the ordinary sheets now being rolled applies to orders which were placed before the last advance or which are for account of buyers whom the mills agreed to protect against any price advances over the remainder of the year. Cleveland reports state that considerable tonnages of steel bars are being sought by manufacturers of automobile bumpers.

**Pig Iron.**—Automotive foundries are placing more orders. Most of this iron, however, is for early delivery. The first quarter 1922 market is still on a nominal basis, expectation of a downward revision of freight rates casting a haze over the situation and acting as a restraining factor.

**Steel.**—Strip steel producers are working at a relatively satisfactory rate, exceeding in the case of some mills 50 per cent of capacity. Most of the output, however, applies to specifications furnished on contracts carrying the 2.00¢ price on the hot-rolled and 2.75¢ on the cold-rolled. In the semi-finished market one still hears of sales of sheet bars at \$30, Pittsburgh.

**Aluminum.**—There is a decided lessening in pressure on the market by German bargain offers. The lowest price for foreign ingots is now 18¢, duty paid. The sheet market is firmer. Considerable tonnages of foreign aluminum will arrive in the next few months but practically all of this metal is for account of consuming buyers and will in no wise increase the floating supply.

**Copper.**—The copper market is once more in the midst of one of its balloon ascensions. Part of the advance scored will undoubtedly stick, but, as usual, in such upward movements, there is a tendency to overstrain the market.

## INDUSTRIAL NOTES

**Leach Biltwell Motor Car Co.** of Los Angeles, with the opening of its new foundry and casting department at the factory, is manufacturing the Leach car in its entirety in its own plant, with the exception of axles, starter and carbureter. The new department where aluminum, brass and other castings are made occupies a large building in the rear of the engine plant. New equipment is arriving daily for the foundry and other departments which will add greatly to efficiency and capacity. A schedule calling for 1200 cars in 1922 has been settled upon, although officials expect this program to be exceeded.

**Winther Motors, Inc.**, recent consolidation of the Winther Motor Truck Co., Marwin Truck Corp. and Kenosha Wheel & Axle Co., all of Kenosha, Wis., has taken steps to provide more adequate facilities to accommodate development of all departments, including passenger and commercial cars, axles and wheels. There is now nearing completion a one-story factory addition, 62 x 386 ft., and it is said that further extensions are planned immediately after Jan. 1.

**Steel Wheel Co.** has been formed to handle the distribution of Gier Tuarc steel wheels, manufactured by the Motor Wheel Corp. of Lansing, in Greater New York, Newark, Jersey City and surrounding territory. The company is headed by Thomas J. Wetzel, who will also continue to represent the Motor Wheel Corp. in the East.

**Marvel Battery Co.** of Chaska, Minn., has moved to the St. Paul Midway, where greater facilities are offered for its increasing business. The company will produce from 200 to 500 batteries a day.

**Huron Truck Co.**, Bad Axe, Mich., has been merged with the Ruggles Motor Truck Co. Saginaw.

Constantinople Tractor  
Trials Probably in May

WASHINGTON, Nov. 23—Postponement of tractor trials which were to be held at Constantinople in September, owing to military activities in the neighborhood and general economic conditions, brings the hope among foreign trade promoters that American tractor manufacturers will manifest more interest in these markets next spring, when it is proposed to hold the exhibition.

The assistant trade commissioner, Julian E. Gillespie, reported to the Department of Commerce that only three American companies were entered in the tractor trials scheduled for this fall. He believes that the date will be set in May and the Department of Commerce has notified tractor manufacturers and other exporters of this opportunity.

Sales Meetings Urged  
at Milwaukee Convention

MILWAUKEE, Nov. 21—Ludington Patton, head of the Patton-Pitcairn division of the Pittsburgh Plate Glass Co., a consolidation of the former Patton Paint Co. and Pitcairn Varnish Co., both of Milwaukee, discouraged the cancellation of sales conventions in an address at the annual fall sales conference of the

sales managers and paint and varnish salesmen held in this city.

"America's business problem is no longer production, but selling," he said in the principal keynote address to the sales staff. "While economies are paramount under judicious business administration, they should not be achieved at any curtailment of effective selling effort, or at the cost of quality standards in commodities.

"The frequent cancellation of sales conventions by manufacturers as a means of economy is a big mistake. Now is the time for sales conventions. Now is the time when the salesman and his house must be in close contact; when the salesmen need to be energized by house recognition; when he must be familiarized to the finest degree with his product, his house policies, and have the opportunity to learn of successful methods employed by fellow salesmen in other territories.

"The general retrenchment of national advertising is a considerable reflection on the advertisers concerned. Either they have not been buying advertising on the sound basis that it is an active selling power, or they are conspicuously unwise in retrenching now, when advertising is most needed to stimulate the buying idea. In our case we believe we are keeping faith with the dealers when we increase our advertising at a time when the dealers most need support."

British Committee Makes  
Anti-Dazzle Suggestions

LONDON, Nov. 7 (*By Mail*)—The third interim report of the Maybury Committee of the Ministry of Transport on dazzling headlights covers the following points by way of recommendation and comment:

(1) A reduction of the height of motor headlight beam is recommended so that the glare shall not come within the vision of cyclists and pedestrians, to which end it is suggested that the specification of a standard headlight should have a maximum height of 4 feet from the ground at 150 feet from the lamp, the lower edge impinging on the road not more than 50 feet from the face of the headlight.

(2) A minimum illumination for all vehicles is declared impracticable, and, in the event of a prosecution for driving to the danger of the public at night, it is recommended that the adequacy of the lights should be an element to be taken into consideration by the court.

(3) Swivelling or tilting headlights are dismissed as useful but too dependent on the courtesy of drivers.

(4) The use of an additional lamp fixed in a low position is suggested for use in fog, provided that its light projects downward and forward.

These recommendations though not to be taken as final, are likely to be embodied in the new Government legislation concerning automobiles and automobile traffic.

## NO NEW CEYLON TARIFF

LONDON, Nov. 14 (*By Mail*)—The effort to control the Ceylon automobile market by a preferential tariff in favor of British cars has been abandoned because of the opposition evoked. Therefore all automobiles will continue to pay the same rate, 7½ per cent ad valorem, irrespective of their place of origin.

## BANK CREDITS

*Written exclusively for AUTOMOTIVE INDUSTRIES by the Guaranty Trust Co., second largest bank in America.*

The district easing of money rates as evidenced in the quotations of the past week was a reflection in part of the gradual liquidation of frozen loans which has been going on for the last few months. Call money ranged from 4 per cent to 5½ per cent as compared with 5 per cent to 6 per cent in the previous week. Time money also showed an easier undertone, with quotations at 5 per cent to 5½ per cent for all maturities from 60 days to 6 months as against 5 per cent to 5½ per cent for 60 and 90-day paper, and 5¼ per cent to 5½ per cent for the longer maturities in the previous week. Prime commercial paper remained at 5 per cent to 5¼ per cent. Although funds were more freely available, no large loans were negotiated.

In the Federal Reserve statement as of November 16, the total reserve ratio showed a further increase for the week from 71.4 per cent to 71.8 per cent. Total reserves increased \$8,685,000, which was accounted for by a gain of \$7,602,000 in gold holdings and an increase of \$1,083,000 in other cash reserves. The total deposits increased \$10,851,000, while reserve notes in circulation decreased \$22,607,000.

The total reserves of the New York institution increased \$30,905,000, but there was a decline of \$87,958,000 in total earning assets.

## Sterling Reaches High Point

During the past week, sterling exchange rose above \$4.00 to the pound, the highest point of the year. Several reasons are assigned to this rise, among which are included the betterment of Great Britain's export trade, and the improved internal economic condition following the adjustment of the difficulties with the coal miners. Last week also marked the seventh anniversary of the inauguration of the Federal Reserve System. On November 15, the New York Telephone Company offered \$50,000,000 of 6 per cent Bonds at 97. This offering was oversubscribed nearly ten times, a fact which is significant not only of the demand of the investing public for sound securities but of the accumulation of funds seeking investment.

## MAY BUY ALLEN PLANT

BUCYRUS, OHIO, Nov. 23—L. A. Sommer, designer of the motor for the Allen car, is understood to be negotiating with the receiver for the Allen Motor Car Co. with a view to purchasing the plant and using it to manufacture motors.

## WILL SELL BETHLEHEM

ALLENTOWN, PA., Nov. 23—Calvin E. Woods, receiver for the Bethlehem Motors Corp., will apply to the United States district court at Philadelphia Nov. 28 for permission to sell the plant.

## MEN OF THE INDUSTRY

Edward H. Fitch has been appointed manager and J. H. Connors, manager of mechanical sales of the Republic Rubber Corp. Fitch served as district manager of the Philadelphia division of the Diamond Rubber Co. for fourteen years and upon the consolidation of the Goodrich and Diamond divisions in that city was placed in charge. For the past three years he has been manager of sales to automobile manufacturers for the Diamond division with headquarters at Akron. In June, 1920, he was appointed director of sales of the Diamond company covering tires and mechanical goods. Connors had been in charge of the mechanical sales in the Boston district for the B. F. Goodrich Co. for fifteen years. Subsequently he became manager of mechanical sales in the Philadelphia district and manager of mechanical sales of the Diamond division of the Goodrich company for the central district.

W. B. Mowbray, assistant purchasing agent of the Amalgamated Sugar Co., has been appointed general manager of the Aero Cushion Tire Co. He succeeds general manager W. E. Spencer who is planning to take care of his Wyoming interests, but will remain at the factory for several weeks. Major W. C. White becomes salesmanager and will be closely associated with Mowbray in furthering the company's business. The new management is planning important changes which will include the opening of a number of branches in the Intermountain West. Plans are under way for amending the articles of incorporation and re-financing the company.

William R. Petze has been appointed sales manager of the American Metal Parts Co. of Boston which manufactures piston rings. Petze has a record of 17 years in the automotive industry, the greater part of which has been spent with automotive and hardware jobbers in this country and in Canada. He is credited with having had much to do with working out the present jobber policy of distributing piston rings. Until recently he was sales manager for branches of the Splitdorf Electrical Co. of Newark.

J. H. Willson, former managing director of General Motors, Ltd., of London, England, has become president and general manager of the Maxwell-Chalmers Sales Co. of Chicago. Before going to London for General Motors he was manager of the New York, Brooklyn and Long Island territory for the Chevrolet Motor Co.

Arthur G. Hertzler, who has been sales manager of the Bearings Co. of America, Lancaster Pa., and connected with that firm in various capacities for eighteen years, has severed his connection with the company and will make his home in Salt Lake City. He has not announced his business plans for the future.

A. F. Pond, chief chemist for The Good-year Tire & Rubber Co. of Canada, Ltd., has been transferred to Los Angeles to succeed Burgess Darrow in similar work at the Goodyear's coast plant. Darrow returns to Akron as development manager of the parent company.

Claude C. Ostrom, formerly purchasing agent of the Locomobile and later general manager of the Washington Steel & Ordnance Co., has become associated with the Pennsylvania Forge Co. as vice-president, and in charge of sales.

Verne G. Orr, secretary and general manager of the Waterloo-Overland Co. of Water-

loo, Iowa, has been appointed manager of the Willys-Overland branch at Indianapolis. The territory under his control consists of Indiana, Kentucky and a part of Illinois.

D. J. Maloney, who for the past three years has been connected with the Carroll Engineering Co., as assistant general manager is now associated with the Columbia Engineering Co., Dayton, Ohio as president and general manager.

F. J. Jackson has been appointed manager of the Barley Motor Car Co.'s factory branch at San Francisco. George Clark, former manager, has been made sales manager of all territory west of Denver.

Rudolph Miller, who has been advertising manager of the National Motor Car & Vehicle Corp. of Indianapolis, has been made assistant sales manager.

W. A. Henderson, manager of the Dort Auto Body Works, Kalamazoo, since its purchase from the Lull Buggy Co., has resigned.

C. E. Sorenson and C. Burbaker, directors of the Ford Motor Co., are leaving for a tour of inspection of the Ford plants abroad.

Thomas Brooks, Inc., has been appointed Elgin distributor in Detroit and four surrounding counties.

## FINANCIAL NOTES

Ajax Rubber Co., it is understood, is planning to fund that portion of its bank loans falling due next month, approximating \$5,000,000, through the sale of notes or bonds. At present there is outstanding \$10,000,000 of an authorized issue of \$20,000,000 (\$50) capital stock. The company has no funded debt. The new financing, Ajax interests say, is not a matter of necessity but through the belief that bank loans can be eliminated on a favorable basis.

Stoughton Wagon Co., Stoughton, Wis., is starting work on a new group of buildings for its motor truck division to replace those recently destroyed by fire. The company announces that all orders will be delivered according to schedule, having made arrangements to care for production and prompt shipments.

Franklin Automobile Co., during the first ten months of this year, shipped 3,256 sedans which represents an increase of 16 per cent over the same period last year.

Kelsey Wheel Co. has declared an initial dividend of \$1.50 a share on the common stock, payable Jan. 2 to stockholders of record Dec. 20.

## Chevrolet Opens New Plant in Indianapolis

INDIANAPOLIS, Nov. 23—Chevrolet Bros. Mfg. Co. of this city is now located in its new factory here. Arthur Chevrolet is president; Louis Chevrolet, treasurer, and Arthur H. Serr, sales manager. The chief product will be Frontenac cylinders for Fords. The company will also build the Fronty-Ford racing cars.

Louis Chevrolet, designer and builder of Frontenac racing cars, will also have factory space in the new building, as will Arthur Chevrolet, Inc., manufacturer of steel gear rings for stripped fly-wheels.

## G. M. Contemplates No Radical Changes

## Gradual Improvements Will Be Made in Lines for 1922 Selling Season

NEW YORK, Nov. 23—General Motors Corp. has in prospect no radical or sensational plans, notwithstanding sundry reports to the contrary. The corporation will move along in the next year much as it has in the past, making gradual improvements in its lines and fully prepared for the era of keen competition upon which the industry has entered.

It can be stated positively that none of the divisions of the corporation will be discontinued in 1922 with the exception of Scripps-Booth. Notice of the dissolution of this company has been filed at Albany but it is understood the factory will not be sold. Announcement as to the uses to which it will be put is expected within 30 days.

## Era of Easy Sales Gone

The air-cooled development will be continued but showing or marketing at an early date is not to be expected as the work is still in the experimental stage and the General Motors Corp. policy is against production until exhaustive tests have been made and the corporation is assured that the product for which it must necessarily stand sponsor is everything that might be desired.

The General Motors Corp. realizes fully that the era of "easy sales" has gone, probably never to return. They are urging constantly the necessity of intensive and intelligent selling efforts. They insist that the salesman must go to the prospect and not wait for the potential purchaser to come to him.

## Efficient Servicing Necessary

As a corollary of successful salesmanship, they contend there must be efficient servicing so that a motor car user who once buys a General Motors product never will stray from the field. Hooked up closely with sales and service is a determination to give full value for every dollar paid for any of the General Motors models. The prices of the corporation's lines have followed closely the downward trend of materials, taking into consideration also the lower cost and greater efficiency of labor.

## Mooney Is Transferred from Remy to G. M. Export

NEW YORK, Nov. 23—Announcement was made to-day by President duPont of General Motors Corp. that J. D. Mooney, who is now general manager of the Remy Electric division at Anderson, Ind., will be transferred to the General Motors Export Co. as operating vice-president. I. J. Reuter, who is now general superintendent of the Remy Electric division will succeed Mooney as general manager.

# Calendar

## SHOWS

- Nov. 27-Dec. 2—New York, Automobile Salon, Hotel Commodore.
- Jan. 28-Feb. 4—Chicago, Automobile Salon, Hotel Drake.
- Jan. 7-13—New York, National Automobile Show, Madison Central Palace, Auspices of N.A.C.C.
- Jan. 28-Feb. 4—Chicago, National Automobile Show, Coliseum, Auspices of N.A.C.C.
- Feb. 6 to 11—Seventh National Tractor Show and Educational Exposition, Minnesota State Fair Grounds, Minneapolis.
- Feb. 6 to 11—Winnipeg, Can., Automotive Equipment Show, Western Canadian Automotive Association.

Feb. 20 to 25—Louisville, Ky., Louisville Automobile Show, Auspices Louisville Automobile Dealers Association.

## FOREIGN SHOWS

- Nov. 12-27—Buenos Aires, Annual Motor Show, La Pabellon de las Sosas, Automovil Club Argentino.
- Nov. 26-Dec. 3—Shanghai, China, Automobile Show.
- Nov. 28-Dec. 3—London, Motorcycle Show.
- Dec. 3-14—Brussels, Belgian International Automobile Show.
- March, 1922—Santiago, Chili, Annual Automobile Show.
- May, 1922—Quito, Ecuador, Agricultural Exposition, celebrating Centenary of Ecuador. Automotive Section.

Sept. 1922—Rio de Janeiro, Brasil, Automobile exhibit in connection with the Brazilian Centenary Associao Automobilista Brasileira.

## CONVENTIONS

- Dec. 6-8—Chicago, Second Annual Meeting of American Petroleum Institute.
- Dec. 10—New York, American Institute of Mining and Metallurgical Engineers.
- Dec. 20—Philadelphia, American Society of Mechanical Engineers.
- Dec. 27-29—Chicago, American Society of Agricultural Engineers, Auditorium Hotel.
- Jan. 17-20, 1922—Chicago, American Road Builders Association.

Jan. 30-31—Chicago, Fifth Annual Convention, N. A. D. A., La Salle Hotel.

Jan. 30-Feb. 2—Boston, Sixth Annual Conference of the International Delivery Association, Copley Plaza Hotel.

June 11-15—Milwaukee, Annual International Convention of the Associated Advertising Clubs of the World.

Sept. 18-23, 1922—Rome, Italy, Second Annual Meeting of the International Chamber of Commerce.

## S. A. E. MEETINGS

Detroit, Dec. 23, Feb. 24, Mar. 24, April 28, May 26.

New York, Jan. 11-14, 1922—Annual Meeting.

Chicago, Feb. 1  
Minneapolis, Feb. 8—Tractor Meeting.

## Harding Commended for Good Roads Aid

### A. A. A. Resolution Praises President and Townsend—Insurance Discussed

DETROIT, Nov. 23—Resolutions commending President Harding and Senator Townsend for their activity in behalf of Federal road legislation, were adopted following a two-day conference of the Automobile Association of America executives at the Hotel Tuller this week. The resolutions will be forwarded to the executive committee of the association at Washington for immediate action and it is further urged that these Federal officers and others be asked to continue their efforts looking for further Federal cooperation.

Other resolutions important to the American motoring fraternity which were adopted at the convention epoused the financing of the association on the basis of 25 cents a member of each affiliated club; that the present road marking system be replaced by a comprehensive system installed in each state under the approval of the Federal government; that the present basis of motor vehicle taxation is unfair in some cases, and that an investigation be undertaken to bring about a more equitable adjustment.

The conference went on record through resolution as considering the matter of motor vehicle insurance a local rather than a national concern. It was recommended, however, that this subject be carefully investigated by national headquarters and all affiliated clubs of the association be advised as to the best methods employed by the most successful local clubs in the handling of insurance matters.

The insurance study was one of the red hot features of the convention and the possibility of the formation of a national insurance bureau under the auspices of the A. A. A. was frankly discussed. Opposition on the part of J. L.

Haskin of the Omaha Automobile Club, who favored the local handling of the problem rather than through national action, decided the convention toward favoring the resolution finally adopted.

A study of standardized traffic regulations was also recommended by resolution to the executive committee and to make and carry out plans through its affiliated clubs and general membership calculated to secure the adoption of such regulations by states and cities.

## Jobbers Buy Heavily at Chicago Meeting

CHICAGO, Nov. 19—The Automotive Equipment Association's business exhibit came to a close here today with strong evidences of an upturn in business, in contrast to the feeling the first day or two, when buying was light. By the middle of the week the jobbers had passed their buying record for the entire show a year ago and when the doors were closed it was generally agreed among manufacturers that business on the exhibit floor had been the best since the association started this feature of its activities three years ago.

Statements of jobbers from various sections of the United States and Canada indicated that tonnage turnover of the average jobber in 1921 would be about 85 per cent of last year and dollars and cents volume about 70 per cent, the difference being due to price reductions.

Jobbers have had heavier retail buying since October 1 than before then, which is just the opposite of the usual condition. Reequipment lines naturally have run heaviest, but sales of car accessories, shop equipment and tools have been fair during the past six weeks.

## BRITISH PRICES TOO HIGH

LONDON, Nov. 14 (By Mail)—Sir Raymond Dennis, managing director of Dennis Bros., Inc., Guildford, back from a twenty months' world tour, says in effect that there is a call for British motor goods but that present prices are too high.

## Trade in Britain Declines in October

### Gross Decrease for Year Will Be Within 40 to 50 Per Cent of 1920

LONDON, Nov. 11 (By Mail)—Britain's imports of cars, trucks and chassis, tires, motorcycles, and parts of cars, trucks and motorcycles in October had a gross value of \$4,085,425 (at par).

Numerically their values were: Cars 126 (2150), trucks 67 (450), chassis 344 (698), and motorcycles 39 (212). The value of the parts imported were: Vehicle, \$1,327,760 (\$3,796,380); motorcycle, \$11,265 (\$132,030); tires, \$1,836,635 (\$2,442,900). The figures in brackets are the corresponding returns for 1920.

The month's exports of British automobiles and parts had a gross value of \$1,565,675 (\$6,514,115), and of tires \$857,380 (\$2,520,265). The numerical values and the destinations were: Cars 128, of which 42 (233) went to British India, 14 (74) to New Zealand, and 72 (334) to countries not specified; trucks, 5 (25) to British India, New Zealand none (31), and 18 (74) to countries not specified, making a gross total of cars and trucks of 151 (771). Chassis exports were 55 (385) to countries not specified, whereas in October, 1920, there were 8 specially scheduled for British South Africa. The month's motorcycle exports were 430 (2333), destination not given.

There has been a marked decrease compared with October, 1920, and the ten months comparative figures go to show that the gross reduction will be within 40-50 per cent of the January-October period of 1920.

## TOWER RECEIVER NAMED

GREENVILLE, MICH., Nov. 21—The Grand Rapids Trust Co. has been appointed receiver for the Tower Motor Truck Co.

# WALTHAM SPEEDOMETERS AND AUTOMOBILE CLOCKS

*World's  
Standard  
Speed and Time  
Recorder*

THE Waltham Air-Friction Speedometer indicates accurately and instantaneously the speed of your car. It is not affected by climatic conditions.

It is standard equipment on such leading cars as Cunningham, Daniels, Fergus, Lafayette, Lincoln, Leach-Biltwell, Packard, Pierce-Arrow, Renault, Rolls-Royce, Stevens-Duryea, Wills-Sainte Claire, and others.

No matter what the make of your car is, it should be equipped with a Waltham Speedometer.

*In the first place*, the name of Waltham is an assurance of quality and precision; *secondly*, the Waltham is the only Air-Friction Speedometer in the world; and *finally*, the builders of the world's leading cars, recognizing these

facts, specify that their automobiles shall be equipped with Waltham Speedometers and Clocks.

Indisputable proof of Waltham superiority is found in the international fame of Waltham Watches, Clocks and Speedometers. This fame rests upon a reputation for making the finest instruments of precision in the world.

Visit any of the automobile agencies representing any of the cars which we have mentioned and ask them to show you the perfection of this Speedometer's performance.

## Prices Must Be Governed by Costs

Price may vary temporarily without relation to costs, but must be in proportion to costs in general. Industry is entering period of declining costs. Marketing costs, especially, must be reduced. A striking analysis of present economic status of industry.

By Harry Tipper

**I**T has been customary to talk about cyclical business changes as though the cycle were a necessary consideration governed by absolute laws.

There is, of course, a law of action and reaction which governs all activities and there is a direct relation between the volume and the price cycles in non-economic products. The products of the farm and the forest vary in volume from year to year and these variations show a cycle change in their action and reaction, which has its effect almost immediately upon the price.

It is probable that there exists some relation between the action and the reaction and the volume of business at any particular moment, and several of the economists who have studied this matter expect to establish a relation between the volume of non-economic products and the volume of total business.

The action and reaction over the whole industrial fabric are subject to so many variable factors in connection with any particular line of business in its relation to the rest, that the prices obtained do not bear any visible relation to the cycle of change discovered in connection with non-economic products. Curves of wholesale prices, therefore, over a period of years are a record of past events only and do not indicate that the future will follow the past conditions.

The chart shown with this article indicates the

variance of wholesale prices in the United States from the War of 1812 to the World War, and it is to be observed that these wholesale prices show in cycles of change of approximately fifty years' duration each.

However, it is absurd to regard a war as a necessary part of a business cycle. If the Civil War had not occurred, the whole trend of this cycle would have been entirely different.

As a record of past events, this curve is very illuminating; as a forecast for the future, it is worth nothing, because the problems facing us are entirely different from the problems faced either at the end of the Civil War or the War of 1812.

When, therefore, the economist talks about our entering an era of declining prices, he simply means that our prosperity depends upon our ability to decrease prices without decreasing wages, because the surplus between prices and purchasing power builds up our wealth. There is no evidence as yet to indicate an era of declining prices.

While prices may vary through a short period without respect to costs, prices over a long period average themselves in proportion to the costs. Unless, therefore, we can reduce costs, we cannot reduce prices over any long period. The short fluctuations will indicate the proportionate amount we must receive to cover the costs.

If the periods of inflation and deflation due to wars are eliminated from consideration, an examination of the curve will show that the introduction of the mechanical system of industry, its growth and development have led to a long period of declining prices during which period wages were being increased constantly and the wealth was being increased.

This was the period when the introduction of mechanical means of production exercised the greatest influence upon the increasing productivity of the worker.

It will be observed that before the War of 1812 there was no period of rising cost for several years and that the rising cost immediately before the Civil War was not marked and was very short in duration. On the contrary, for fourteen years before the World War, the general costs had been rising steadily, so that they had reached the plane established in 1880 and in the period of 1840 to 1850. This rise was very steady showing very minor fluctuations and rising sharply from the minimum price area of 1897. It is obvious, therefore, that the factors operating on prices before the World War were entirely different from the factors operating before the Civil War or the War of 1812.

Further examination into the matter and research developed from all the fragmentary data available show that during the development of the mechanical system of industry the cost of those items devoted to distribution and marketing a product had been steadily increasing.

For the greater portion of that period the increased economies of manufacturing made it possible to absorb the increased cost of the distribution and marketing and still effect a decrease in the price.

The proportion of the sales price required to cover the cost of distribution and marketing, however, increased steadily as the system developed, consolidating the manufacturing in larger units and demanding markets spread over larger areas and developed with greater intensity.

At the period of the War of 1812 the amount involved in the labor, raw materials and capital of production was approximately 90 per cent of the sales price, leaving 10 per cent for distribution and marketing.

In 1900 the labor, raw materials and capital involved in production approximated nearly 50 per cent of the sales price, showing a constant increase in the proportion of the sales price devoted to the motions and costs

of distribution and marketing the goods.

Since 1900 this cost has been steadily increasing.

For a century, therefore, the cost of distribution and marketing has been increasing. For eighty years of that time the growth of the mechanical system permitted this increased cost to be absorbed and still provided cheaper goods. For the last twenty years the cost of distribution and marketing has been too great to be absorbed entirely by the increased economies in manufacturing and has obliged the manufacturer to secure increased prices in order to meet his costs.

The importance of the era from 1810 to 1897 is not understood unless we realize that this was the period of greatest expansion in percentage, of greatest decline in prices, of steadily increasing wages and of the largest increase in the wealth of the industrial countries.

It is not absolutely according to the facts to say that we are in an era of declining prices. The price will depend upon the costs, but it is strictly according to the lesson of the past to say that the future growth of industry depends upon our ability to decrease prices without proportionately decreasing wages. Thus we may add to the wealth what has been destroyed by war and increase the wealth above that amount sufficiently to record the necessary improvement of the industrial fabric.

It is further necessary to point out that our ability to decrease prices will depend not only upon the economies we can make in production and manufacturing, but our ability to make economies in distribution and marketing. In goods that are distributed through wholesalers and retailers the possibility of a 10 per cent reduction to the user from economies in the retail business and the wholesale business is greater than a 40 per cent reduction in the manufacturing cost.

The avoidable and visible wastes in distribution and marketing are sufficiently important to permit the introduction of radical economies in this direction which will influence the costs to a very considerable degree.

In most lines of business comparatively little attention has been paid to the expenses of marketing and distributing the goods, and there is little understanding of the factors entering into this question.

The future improvement of our wealth and general condition of our industry depends very largely upon the

economies we can make in these elements of business. The flow of product from the factory door to the user is slower than the flow of product through the factory. At each point in the journey more cost is accumulated than should be necessary because of lost motion, inefficiency, useless methods, wastes of time and effort concerned not with the increasing of the flow of product, but with taking care of the delays and frozen elements that impede the flow.

The cost in distribution and marketing is in direct proportion to the speed of the flow, and anything that impedes the flow operates to increase directly the cost of the product to the user.

Every element in distribution and marketing has increased in cost in the last twenty years, and the efficiency of the individual engaged in distribution and marketing has not increased, so that in every respect the cost of moving one thousand dollars' worth of goods has increased.

It is necessary, therefore, that the business man determine the factors of marketing, the cost of these factors, the necessities of the operations involved and ways in which they can be improved, so that they do not require the same amount of time and effort for the unit of result.

Declining prices without declining wages are necessary to the continued prosperity of industry, and these cannot be secured without an entirely new consideration of what constitutes industrial efficiency.

The proper analysis of marketing is the basis of this new efficiency, and this analysis must be considered from the character and extent and speed of the flow of product in proportion to the importance of that product in the industrial fabric.

Some of the factors to be considered are obvious at the present time. Others will be determined only as our experience grows.

## A New Model of Speedometer

**T**HE new A-C speedometer is a completely revised design of the instrument which the Champion Ignition Co. announced in 1919. While operating on the same principle, it incorporates several improvements.

This speedometer operates on the magnetic drag principle, having a stationary, permanent horseshoe magnet mounted within the housing. An armature rotates within the magnet, being driven by a flexible shaft from the driving mechanism of the car. Between the armature and the poles of the stationary magnet is a non-magnetic element in the form of an aluminum cup having on its periphery a dial graduated in miles per hour. This light weight cup is sensitive to the magnetic drag caused by the rotating armature which shifts the magnetic lines of force in the direction of rotation. Owing to the light weight of the cup, the dial is very sensitive.

Among the various changes made are the following: The magnet, which was formerly adjustable, is now fixed in position and instead the speed element is now adjusted into and out of the magnetic field by an adjusting screw A. This adjusting screw is set at the factory and then sealed and covered so that it cannot be tampered with after the final adjustment. In the former

instrument automatic thermostatic control was used for changing the relations of the armature laminations one to the other. In the present instrument a solid or single piece rotor is used and the thermostatic control has been eliminated, compensation for temperature rendered unnecessary by the heat treatment of the magnetic elements, it is claimed.

An important improvement in the instrument resides in the provision of automatic lubrication of the high speed bearings. These bearings operate within glands which contain oil that cannot be thrown out of the bearing. This tends to increase the life of the instrument and to eliminate the noise which often occurred after several thousand miles of use. The flexible shafting is of the so-called dental wire type which was developed during the war by the Bureau of Standards. It consists of four layers of piano wire wound spirally in opposite directions, and while permitting a drive through a very sharp angle, is practically free from torsional distortions under the stresses imposed by driving the unit. The odometer is driven off the worm B, while the rotor for the speedometer part of the instrument is driven by a short piece of the flexible shafting C.

Left—New A-C speedometer. Center—Important elements in new A-C magnetic speedometer: A, adjustable screw; B, odometer driving worm; C, flexible shaft driving rotor of magnetic iron; D, magnets; E, non-magnetic cup carrying dials; F, odometer wheel and driveshaft; G, rotor of soft iron. # Changes in Body Design at the Automobile Salon

The popular sedan is apparently giving way to inside driven cabriolets and berlines. Increased use of the soft roof is general and manufacturers show a tendency to revert to long discarded features. Much attention is paid to interior equipment. More domestic than foreign models exhibited.

By George J. Mercer

THE Automobile Salon, which originated as an Importer's Salon, is becoming more and more an exhibition of cars of domestic manufacture. This year twenty of the thirty makes of chassis on exhibition are American-made. These include the Biddle, Brewster, Cadillac, Cunningham, Daniels, Dorris, Duesenberg, Falcon, Fergus, Lafayette, Lincoln, Locomobile, McFarlan, Packard, Pierce-Arrow, Rauch & Lang, Richelieu, Rolls-Royce, Stevens-Duryea and Winton.

Of the foreign contingent Italy presents the greatest number of chassis makes, including the Fiat, Isotta-Fraschini, Lancia and Spa. Great Britain is represented by the Lanchester and Sunbeam; Germany by the Benz and Mercedes, while France and Belgium have but a single car each, the Hispano-Suiza from the former country and the Minerva from the latter. The absence of all the leading French makers—Panhard, Renault, De Dion, etc.—is noteworthy.

The salon, as a whole, however, presents a satisfactory picture of the new in body design. There is a total exhibit of approximately 60 bodies. These are divided into 12 cabriolets, six broughams, 13 berlines, three limousines, three sedans, 12 touring car bodies, one roadster, one brougham-landaulet and seven inside drive cabriolets.

This list serves to show that the line of bodies presented for inspection is, generally, the most expensive made, and this would indicate that the exhibitors have an optimistic feeling as regards the general trend of business. About one-sixth of the exhibits are open bodies, and it was noted that the closed bodies include more of the falling and semi-falling top bodies than ever before. These are even more expensive than the stationary top kind.

## Cabriolets Set New Record

There is a total of seven inside drive cabriolets, which is a record. In previous years there have been but one or two examples of this type, and these have invariably been on the British-made Rolls-Royce. These bodies, in fact, seem almost to have superseded the sedan, for there are but three of the latter bodies exhibited. One of these three is a short close coupled body that is being considered by manufacturers as a production car in the near future. It is designed to be a combination of coupe and sedan.

The exhibition includes yet another new feature in body design, or rather a reversion to an old feature. This is the large number of berlines. This type of body in appearance resembles a sedan. It has a division, however, back of the driver's seat, and the upper part of this division is formed by a window that raises and lowers. Thus the body can be made into one or two compartments at will.

Some years ago this type of body was the only style acceptable by many car users, but it drifted into abeyance. Whether its revival this year will mean much to the quantity built car manufacturer in the coming season is doubtful. The general run of quantity built cars have a short wheelbase chassis and this makes it next to impossible to have a division back of the driving seat and still allow sufficient room for the rear door entrance. There has always been a certain proportion of buyers for enclosed bodies that insist upon more privacy than the single compartment body permits, but if there is not sufficient wheelbase it cannot be considered. However, it is remarkable that a large number of manufacturers are practically making this type supersede the sedan.

As was stated, the inside drive cabriolet has come forward as another substitute for the sedan. The sedan has enjoyed a long run of popularity, but at this show it only equaled in number the limousine that passed out as a favorite several years ago.

## Trying for Cheaper Production

This change from the sedan to the inside drive cabriolet for short wheelbase cars indicates that there is a tendency to strive for cheaper production. Manufacturers are apparently attempting to make enclosed bodies as near the cost of the open body as possible.

A number of manufacturers have used fabric to cover part of the body sides in place of sheet metal, intending probably to use this measure as one to reduce costs. On the type of cars exhibited, however, this fabric is not cheaper, even though the cheapest fabric it is possible to buy should be used. It must be remembered that the fabric must be applied after the metal parts are painted and it requires expert workmen to properly put on the necessary moulding and apply the fabric. This work is less of an automatic operation than the task of putting on the metal. It is done at the time the painted surface is practically finished and the chances of marring such work are considerable. It is to be expected, however, that in time means will be found to cheapen this work and there will probably be seen more bodies with the sides covered with fabric. Such a development has advantages, for it is much lighter and lighter frame work can be used behind it than for the metal covering.

As to body equipment and accessories, it was noted that on all the close coupled bodies, as well as on those of the larger variety, the use of trunk racks is quite extensive. Many of these racks are of the folding type, and on some models the top of the tank is utilized as a base upon which to rest the trunk. The tank is protected by wood strips, and these give less of a conspicuous appearance than the

8—Fiat

ordinary rack. In most cases the use of the rack is accompanied by equipment of the back of the body with perpendicular rods to protect the finish.

There appears to be no general tendency to replace running boards with steps, although this has been done in a few instances on open cars. The steps used as a rule are made to fasten to the body with a shank, similar to the method used on carriages, rather than having a square casting run up to the shield.

The exhibit served to demonstrate the increasing hold the soft roof has gained upon the body builder. Of the total number of bodies exhibited there is but one equipped with a solid roof and this was of the coach type formerly used on carriage work. All the others are made of fabric. Some few had metal formed over the edges and the appearance from the side gives the impression that there is an all metal top. Many of the bodies are skeleton lined on the interior. The bows and slats on such jobs form a visible lattice work. The space between the squares is about six inches. This design affords a light appearing upper structure and shows the tendency of body builders to make bodies as light as service will permit. The roof at best is but an umbrella and it is in line with good sense to make it light. It is also an added attraction to make it light in appearance. Brewster has one body in which the fabric was also used in the side and back quarter. Their method of applying the fabric, however, could be improved upon. The screw heads appearing in the moulding give a rough appearance, as though the car was one only suitable for hunting purposes or for cross country use.

There is a general use of ventilators on the roofs, as well as ventilators on top of the shroud. On many of the open bodies the lower half of the windshield is stationary. This has been true in the past on high class enclosed bodies, but the open bodies had not before been so equipped.

Mudguards on the models exhibited are principally the full crown shape and rather large. Even the few cycle guards shown are made with a reverse turn at the rear end. A few of the cars from abroad use a shape nearly horizontal both for the front and the rear. One exhibitor has guards covered with imitation Spanish leather.

The fabric sun visor is fairly well represented and the Brewster and Healey types of windshield are shown on various cars. The large circular headlight is very general, although several examples of cowl lights are shown. In many cases the spare tire is carried at the front.

Apparently there has been a reversion to some of the features that were used in earlier days. In practically every case, however, the use of the older form of body building is well applied and there is not the appearance of drifting backward. Rather there seems to be a well directed effort to combine the old with the new for the benefit of change and the old gives a touch of newness all its own. This trend was particularly noticeable in the tops of open bodies.

### The Body Lines

The body lines of the open type include, for the most part, the flat top edge. An effect that is quite new has been produced with a Holbrook body on a Packard chassis. A recessed panel about three inches wide extends the entire length of the body and hood. This panel is sunk down about one-quarter inch and is painted red, while the body is brown.

New radiator designs are predominated by the round form. The rear corners of open bodies are also rounded.

Open body trimmings do not differ from previous years, except, perhaps, there is more plainness in design. Design leather is also common and interior lights are used on one open body, these being the small round pattern fastened to the rear bow on each side. Step lights are

also used in some cases. They are generally placed within the splashers. Foot rests and robe racks are the rule and the trimmings on the newest designs are made to conform to the body line all the way around, including the back seat. In other words, the top line of the body is distinct and visible throughout, giving a clean-cut look to the interior, although it is doubtful if the rear seat is as comfortable as it would be were the trimmings higher. The outside handle is dispensed with on half the open bodies, while the others use both the outside and inside.

A variety of designs is shown in the trimmings of the enclosed bodies. The wood panel with decorative designs is used largely on the doors and the inlaid natural wood strip is also used across the division on the doors. The designs of the seats and backs give an appearance of comfort, either when plain or pleated. The use of divided seats is quite common, the division being made in some cases to swing back out of place in the front seat. The rear seats, however, have a substantial arm chair division. The use of the arm rest on each quarter panel is general.

The interior appearance of practically all the enclosed cars gives the effect of study in design. There is, however, on some of the models, a tendency to crowd all the various appliances into too small a space. For instance, the visible vanity case, the dictograph inside the door, pull-to handles, regulator handles, etc., all within a small space, give the appearance of too much silver punched together. Corner and center dome lights are the rule, as are visible vanity cases. The interior wood finish, in most cases, is confined to the moulding around the windows. The seats are, in many cases, furnished with pillows and pillows are used as foot rests. The doors, generally, are plain. On some of the berlines pockets are provided on the doors in the driver's section and occasionally a panel effect on the rear door is seen. More often, however, the rear door is entirely without design and never with a pocket on domestic cars.

The upholstering material is principally worsted and wool fabrics, broadcloth and bedford cords. The color gray predominates. There was but one body covered with mohair. On the berlines the driving compartment is finished in leather, and on some models a shoulder division is used.

As to colors, there is, as usual, a wide range. Brown and red are used together with good effect. There are several grays and a few blues. There are two unfortunate combinations, one being due to an overdose of red trimming and the other having a similar fault due to nickel and bright aluminum. Striping is used to some extent on half the cars, the broad glazed stripe with two hair lines being the most common. In a few cases the hoods are striped.

Body builders having exhibits at the salon are Brewster, Brooks-Ostruk, Pease, De Causse, Derham, Fleetwood, Healey, Holbrook, Locke, New Haven, Rochambeau, Smith-Springfield, Walterm and Murphy.

A more detailed account of the salon will appear in next week's issue of AUTOMOTIVE INDUSTRIES.

### A Show Room for Foreign Buyers

**W**OLSELEY MOTORS LIMITED of England have just opened what the London *Times* declares to be one of the most handsome and most expensive show rooms in the world. The new building is located in Piccadilly at the corner of Arlington Street, London.

While this show room will by no means be closed to the domestic purchaser its prime purpose is to stimulate exporting. The site selected is one which gives the new building an international status, and the splendor of the place should attract many buyers from all parts of the world.

# Recent Developments in Bodywork on British Cars

Small four-passenger cars have scanty leg-room and lower sides than are usual in British practice. Many framed curtains or light removable window panels are employed. General body design similar to last year.

By M. W. Bourdon

**T**WO trends stand out prominently after a careful inspection of British open bodies at the Olympia show, both relating to the smaller sizes of car of from 10 hp. to 14 hp. The first is a lowering of the high standards of passenger comfort and protection hitherto characteristic of British cars in general, and the second the widespread adoption of framed side curtains—or light, detachable panels—which open with the doors or in some other way eliminate many of the drawbacks associated with side curtains of the usual type.

Dealing with the first of these developments, it is obvious that on four-passenger "light cars" of the power mentioned the comparatively short wheelbase must have the result of restricting the body space behind the dashboard, unless, as is sometimes the case, the very undesirable plan of making the rear seat greatly overhang the rear axle is adopted. But the fault is not so much in this as in the reduced height of the side panels from floorboards to elbow line.

This lowering of the sides implies less "freeboard" above the seat cushions, unless the latter are lowered to a similar extent. Some makers have followed this plan, but it is not appreciated by potential users who have passed middle age, owing to the difficulty they experience of rising from unduly low seats and the physical discomfort felt on long runs on rough roads.

## Reasons for Reduced Height

The reason for the reduced height of body sides is clear. The desire is not only to reduce the wind resistance area, but also to obtain a symmetrical outline for the car as a whole. Naturally the smaller cars have lower radiators and hoods, but sometimes the radiator is made higher as a compromise between chassis and body requirements. Thus the 11-hp. Humber has had its radiator height increased 5 in. as compared with its forerunner, the 10-hp. But while this has brought the top line of the hood almost horizontal and in line with a reasonable height of body side, it would not allow the latter to be raised appreciably without detracting from the appearance of the car. But instead of providing seat cushions reduced as a whole in their height from the floor, a more pronounced rearward inclination has been given to both cushions and back rest, of the front seat in particular; while, therefore, the haunches of the passengers are lower than usual in larger cars, the slope of the cushion keeps their knees at the same elevation, and their legs from knees to feet do not assume that approach to the horizontal to which objection is taken by the average owner when low and nearly flat cushions are provided and which, by imposing the whole weight of the legs on the backs of the heels, is so tiring on long runs.

This plan of increasing the rearward slope of seat cushions and back upholstery is of advantage in another way; it enables the front seat to be brought farther forward without cramping the driver and his companion. Thus another couple of inches or so are available for the rear compartment and increases to that extent the leg-room or cushion width at the back without affecting overhang. And, of further advantage, the front seat occupants are brought closer to the windshield, so receiving more protection from the latter.

The extent to which the body sides have been lowered in relation to the seat cushions varies pronouncedly, of course, on different makes of bodies; but whereas formerly this "free board" ranged from 12 to 15 in. for cars of 15 hp. and over, the average is now 9½ in. on 10 to 14 hp. cars. The difference is further increased in many cases by the reduction in the thickness of the cushion, which prevents the occupants from "sinking into" the latter so much.

In respect to British body design in general, there is not much change from last year. More makers are carrying the side panels over the top edge of the framing, some using aluminum or mahogany beading to cover the junction of panel and upholstery, though more often the latter finishes in a "cord" above the edge of the panel. Side panels, too, are more often of the curved-in-top design, the curve in pronounced form extending down the side some 3 to 4 in. and leading into a continuous sweep to the bottom edge.

Buttoned upholstery is still most favored, though not infrequently cushions are plain with a roll or thickening some 4 in. wide and an inch deep at the front edge. Seat cushions generally are not sloped so much as they were, though there are very few examples of the flat, plain cushions and none of the semicircular (inside elevation) pattern observable on many of the cheaper American cars. Almost without exception British cushions are thicker in front than behind, some showing considerable difference in this respect.

## Light Cars None Too Roomy

On light cars with 96-108-in. wheelbase, the four-passenger bodies are frequently none too roomy, and a driver or passenger of more than average height and leg-reach is decidedly cramped. Then, too, with their comparatively low sides they are somewhat draughty at the back, though the front seat occupants are usually cosy enough, owing to the setting back of the cowl, which in some cases extends to within 8 or even 6 in. of the front edge of the front seat, a feature which necessitates the seat cushion overlapping the doorway.

Ventilators at the sides of the cowl are provided in approximately 40 per cent of cases, but they are of little

## Body Dimensions of Various British Cars

1—18 hp. Armstrong Siddeley  
2—15 hp. Wolseley  
3—14 hp. Vauxhall

4—14 hp. Sunbeam  
5—12 hp. Rover  
6—12 hp. Swift

7—11 hp. Humber

11—10 hp. Calthorpe  
12—8 hp. Standard

advantage when the atmospheric temperature is over 75 deg. Fahr. Nearly all doors have front hinges and cannot, therefore, be set open to form air-scoops.

Very few British cars with open bodywork are intended for more than five occupants; that is to say, folding additional seats are found only on specially built bodies; as a result, there are very few rear compartments having as much as 26-in. floor space between the back of the front seat and the front edge of the rear cushion. This space averages 20-22 in. in cars of 15 hp. and over, with a cushion width of 18 to 20 in. front to back. It can be said, therefore, that full-sized, five-passenger bodies have very little overhang of passenger weight behind the rear axle.

Generally the axle lies approximately under the center of the rear cushion, though in the small sizes overhang is distinctly pronounced when the legroom is fairly adequate. Five-passenger bodies rarely have a rear seat wider than 44 in. inside measurement, and the majority of the cushions are only 42 in.

### A Standard Top

Quite a number of makers now standardize, for classes from 11 hp. upward, a sedan with fixed top and an "all weather" type—a folding top sedan with drop side glass. Both types of closed bodywork usually have only one door on each side, the top enclosing the passengers and driver in a single compartment. The door at the right is then generally at the front, 24 to 28 in. wide, the other, on the left, being at the back. Sliding and hinged back single bucket seats, or, alternately, single seats hinged to the floor allow communication from front to back. In some cases only two wide front doors are fitted, entrance to rear being by hinged or sliding front seats.

Concealed folding tops are not increasing in number; in fact, Austin in the next series of Twenties will return to the exposed folded top and Vulcain has already returned to it.

The accompanying diagrams prepared at the Olympia Show give twelve examples of British car bodies on chassis from 8 hp. to 18 hp. They are not drawn to scale, but the dimensions can be taken as approximately correct. They were originally prepared to indicate the seat cushion and back upholstery angles and shapes, and in this respect they have been drawn with particular care. Thin, unbroken lines indicate the outline and position of the doors.

The following remarks concerning the various constructions illustrated will give additional information indicating the trends of British standard bodywork design, as distinct from that on such cars as Rolls-Royce, Napier, Lanchester and other costly cars, for which the bodies are usually built to order.

**18 hp. Armstrong Siddeley.** This chassis, a new model with six-cylinder  $2\frac{3}{4} \times 4\frac{1}{8}$ -in. engine, has a wheelbase of 120 in. and a track of 51 in. It is supplied as a four-passenger car and its comparatively narrow track calls for "paddle-boxing" of the rear side panels to provide a seat width of 42 in. On present standards the leg room for the back passengers is above the average, the width between front seat back and cushion edge being 24 in., and this in effect is increased by the rear cushion being 22 in. wide. The body has four doors, 19 in. wide by 23 in. high, rear hinges, inside handles and leather buttoned upholstery, the front seat being a unit adjustable fore and aft. The cowl extends rearward to within 12 in. of the forward edge of the front seat cushion when the seat is in the position suggested by the diagram. The price of this model is £880.

**15 hp. Wolseley.** This also is a four-passenger body, the track (52 in.) prohibiting three passengers being

comfortably accommodated abreast at the rear; the wheelbase is 118 in. Here, again, more than enough floor space is available at the back and yet not enough for extra seats or luggage of any dimensions when four passengers are aboard. Only 3 doors, 18 in. wide by 22 in. high, are provided, the gear shift lever being on the right of the driver; but alongside the latter is a detachable panel in place of a door, normally secured by 4 studs and nuts and intended to be removable merely for chassis adjustments. The rear doors have their bottom corners cut away to clear the fenders. Adjustable front seats as a unit are provided for £24 extra on the car price of £800. The upholstery is of leather and buttoned; the cowl reaches back to within 12 in. of the front seat edge.

**14 hp. Vauxhall.** This is the new Four with a bore and stroke of approximately  $2\frac{15}{16} \times 3\frac{1}{8}$ , the chassis having a wheelbase of 116 in. and a track of 50 in. The body is a four-passenger with four  $\frac{3}{4}$  doors, the latter being only 15 in. wide and 15 in. high in body sides 22 in. deep, and therefore implying a sill 6 in. or so in depth. The cowl extends back to within 6 in. of the front cushion edge; the upholstery is of leather, plain, except for a single row of buttons near the top of each seat back; inside handles and front hinges are used for the doors and a metal framing for the folding top. The normal clearance below the steering wheel is decidedly meager, viz., 6 in., but with a flexible cushion it becomes ample even with a winter coat when the driver is in position. The car sells at £750.

**14 hp. Sunbeam.** Four-passenger open bodywork only is standardized for this new model Four with overhead valves ( $2\frac{7}{8} \times 4\frac{3}{4}$  in.). The wheelbase is 118 in. and the track 51 in. Three doors are fitted, 20 in. wide of the full height of the body sides, 21-22 in.; they have front hinges and inside handles. The front seats are adjustable fore and aft as a unit, the rear edge of the cowl being 16 in. in front of the cushion edge normally arranged; the upholstery is of leather, plain on the seat cushions and pleated on the backs. The folding top has steel tube framing. Price, £720.

**12 hp. Rover.** Despite its smaller "catalog" horsepower this has a slightly bigger engine than the Sunbeam, the dimensions being the same as the Vauxhall ( $2\frac{15}{16} \times 3\frac{1}{8}$  in.). It is a roomy four-passenger body, the rear seat being 42 in. wide and is often used for three adults. It has three doors 18 in. wide and 20 in. high, front hinges, inside handles; the leather upholstery is unusually "soft," thus giving a greater practical clearance between steering wheel and front cushion than the normal 6 in. implies. The front seat has two separate cushions, that for the driver extending 2 in. farther forward than the other, and the back of this seat is bulged slightly at the center, giving a slight curvature behind each of the occupants; the cushions and backs are buttoned, with plain side upholstery. The cowl extends to within 13 in. of the front edge of the driver's cushion. The price is £660.

**12 hp. Swift.** This is a four-passenger body on a wheelbase of 108 in. and a track of 48 in. The rear overhang is considerable (approximately 20 in.), the rear axle center being not far behind the front edge of the back cushion. This results in a by no means pleasing appearance—to say nothing of detracting from passenger comfort. There are three doors with front hinges, 18 in. wide by 22 in. high, the back ones being cut away considerably at their bottom rear corners to clear the fenders. The rear panels are "paddle boxed" and narrow arm-rests are fitted at the sides of the rear seat; the cowl extends to a point 14 in. forward of the front seat cushion. Price £600.

**11 hp. Humber.** The four-cylinder engine is 2 11/16 x 4 3/4 in., the chassis having a wheelbase of 105 in. and a track of 47 in. And yet in appearance the four-passenger car is much in advance of the Swift, with less overhang and yet quite ample leg room. The diagram, correct though it is in respect of the angle of the front seat back, conveys a rather false impression as to the natural pose of the occupants. That is to say, the greater slope of the cushion imposes more pressure on the bottom part of the back upholstery than usual and the latter "gives" to the passenger at the small of his back so as to make his normal pose more upright than the diagram suggests; it does not compel a semi-reclining attitude. Three doors are provided, 18 in. wide, the front cushion extending half way across the opening and reaching forward to within 8 in. of the back of the cowl. The upholstery is of leather and buttoned. The price of the car is £620.

**Morris Cowley.** Engine dimensions in this case are 2 3/4 x 4 in., the wheelbase is 102 in. and the track 48 in. Rear overhang is pronounced 22 in., bringing the axle almost under the front edge of the rear cushion. Only two doors are fitted, both on the left, though in a better grade model termed Morris Oxford, there are four doors and the upholstery is in leather instead of imitation, as in this case; body dimensions are, however, much the same in both types. The doors are 18 in. wide x 20 in. high and have inside handles; the cowl is 16 in. in front of the driver's cushion edge. This small four-passenger sells at £340.

**10 hp. Singer.** With a 96-in. wheelbase and 48-in. track this chassis with its 67 cu. in. engine has not been sold with anything but a two-passenger body until recently. The four-passenger appeared in public at Olympia for the first time. Passenger accommodation is meager, for too much of the chassis length is devoted to engine space and the somewhat excessive rake of the steering column makes the wheel too close to both seat cushion and back, viz., 5 in. and 9 in. respectively, before the driver is in position. (At Olympia it was stated that the steering column rake is to be altered to overcome this objection.) Three doors are fitted, the front one being 15 in. wide x 20 in. deep and the rear ones of the same width but only 13 in. deep—practically half doors, the object of which is to afford front support for the rear seat frame. The seats are narrow for two normal sized adults, viz., 36 in. only, but this is the usual width on these very small four-passenger models. There is 14-in. overhang behind the rear axle, the cowl extends to within 8 in. of the front edge of the driving seat, and the top line of the body is only 37 in. off the ground—a dimension which gives an idea of the size and low appearance of the car. The upholstery is buttoned and of leatherette, and the price is £420.

**10 hp. Wolseley.** This also was originally made only for two-passenger bodies, and its engine size (70 cu. in.) was considered small at one time even for that purpose. Even now, with its 99-in. wheelbase and 46-in. track, it is not offered as a full four-passenger, the makers styling it for "two adults and two young persons." But it is not infrequently used for four adults though, as the diagram indicates, the knee and leg room at the back is decidedly meager. There are two doors only, 15 in. wide, the opening at the back being reduced almost by half owing to the sweep of the front seat panel encroaching on the rear door space. Front hinges and both inside and outside handles are fitted, the top line of the body sides being 42 in. from the ground; above this the opened folding top extends for 28 in., which is distinctly high for a car of this type and gives it a somewhat top-heavy appearance—besides increasing the

wind resistance when the top is raised. The rear edge of the cowl is 12 in. forward of the front seat cushion. Price £525.

**10 hp. Calthorpe.** This chassis also has a 70 cu. in. engine with a 99-in. wheelbase, but the track is narrower than any other of these small four-passenger cars, viz., 44 1/2 in. Rear overhang from the axle to the back panel is considerable (24 in.) and this, too, with quite a shallow seat (17 in.) and scanty upholstery for the driving seat back. Leg room at the rear is increased by sinking the floor boards into a pronounced "well." The three doors are 16 x 16 in., the back ones cut away to clear the fenders. From the front of the driving seat cushion to the back edge of the cowl is 12 in.; the upholstery is buttoned throughout and of leather. The price is £375.

**8 hp. Standard.** In engine dimensions this new model is similar to the Singer (66 cu. in.), but it has been designed for either two or four-passenger bodies and has a wheelbase of 102 in., the track being 48 in. The four-passenger body affords an example of the plan of lowering the cushion height to obtain more free board—at the front only, however, for the axle center compels "boxing" of the rear seat base and gives the cushion a height of 12 in. as compared with 6 in. at the front. The front seats are separate, adjustable fore and aft and have hinged backs so that the fore and aft dimensions given on the diagram are subject to variation on account of this construction. The body has three doors, all of which are exceptionally wide, viz., 24 in. at the front and 22 in. at the back; they are 18 in. high and those on the left are separated by an ironed pillar 3 in. wide to carry the latch of the front door and the hinges of the rear one. The cowl is very distant from the front seat, its rear edge being 18 in. in advance of the cushion, and in this respect the car is almost unique among British productions of any size; this does not add to passenger protection and warmth, though facilitating entrance and exit. The back upholstery is detachable, to provide space behind it for the framed side panels of the folding top. The rear axle is only 12 in. in front of the back panel, the latter being the only one of the body which has not an absolutely flat surface. The upholstery is plain and of leatherette; doors have inside and outside handles and the top line of the body is only 36 in. from the ground. The price is £340.

## New Zealand Tariff Proposals

THE Coach-Builders' Association of New Zealand are urging the following scale of tariff on automobile imports: Two- or three-passenger roadster body, £30, with £40 surtax for foreign manufacture; four- or five-passenger touring car body, £50, with £60 surtax; six- or seven-passenger touring car body, £55, with £65 surtax; bodies fitted with canopy tops, fixed or movable, £65, with £75 surtax, or 50 per cent and 55 per cent *ad valorem*, whichever is the higher duty; imported chassis, excluding rubber tires, unassembled, 5 per cent, with 10 per cent surtax *ad valorem*; assembled chassis, 10 per cent, with 20 per cent surtax *ad valorem*; parts of bodies from 15 per cent with 20 per cent surtax and upwards *ad valorem*. The present duty on imported bodies is 20 per cent *ad valorem* and 10 per cent preferential surtax on bodies non-British or not from British Dominions, and 10 per cent *ad valorem* and 10 per cent surtax on British bodies.

The intention behind these demands obviously is to develop a native body-trade and it is noteworthy that the home built automobile bodies are accounted better and cheaper than those imported on cars, excepting the best grade chassis.

# Stevens-Duryea Producing High Grade Six

Successor to older company has modernized the chassis formerly built and is now active in competition for quality trade. Changes made in bringing the chassis up to date are here described and illustrated.

By Herbert Chase

**S**TEVENS-DURYEA, INC., is now producing at its new plant a high-grade passenger car which is similar in most particulars to the car formerly produced by the old Stevens-Duryea company. The latter company, it will be remembered, retired from business and sold its plant several years ago. The present concern is an entirely new organization, but has continued, with some modifications, the manufacture of the same chassis formerly produced by the older company.

The Model E powerplant, which was one of the earliest unit types ever built, is substantially identical in most mechanical features with the older Stevens-Duryea powerplant, but incorporates a number of refinements and changes in external appearance made with a view to bringing it up to date and adapting it for use with present-day fuels. The cylinders are cast in pairs and mounted on an aluminum crankcase. The crankshaft is of the four-bearing type. The main bearings are  $2\frac{3}{8}$  in. in diameter and the crankpins  $2\frac{1}{16}$  in. in diameter. The changes include the addition of a Lanchester vibration damper inclosed within the pulley from which the fan is driven. There has also been fitted an entirely new set of manifolds. The exhaust manifold, which formerly had its outlet at the rear, has been changed to give a front outlet, thereby making it easier to prevent

overheating of the floorboards in the driver's compartment. The central portion of the inlet manifold is now exhaust-jacketed. Hot gas discharged through the jacket returns to the exhaust pipe at a point below the carbureter. A throttle in the exhaust by-pass is arranged to open as the carbureter throttle closes, with a view to adding maximum heat to the charge at low throttle positions. A stove surrounds the exhaust pipe where it passes under the carbureter, and all the air entering the carbureter is drawn through this stove unless the sleeve on the carbureter inlet elbow is open, as it may be, if desired, in warm weather. The lower portion of the inlet manifold is jacketed with hot water taken from the top of one of the cylinder head jackets. Fuel is fed to the Stromberg carbureter by a Stewart-Warner vacuum tank of large size. This takes fuel from a 25-gal. tank in the rear of the chassis, whereas fuel was formerly fed by gravity from a tank under the front seat.

The engine is provided with pressure lubrication on the main bearings, but the connecting rods depend upon splash from troughs which are kept filled to a constant level by streams of oil from the pump.

The engine is said to develop a maximum of 90 hp. at 2000 r.p.m. The clearance volume is 26 per cent of the total volume (clearance volume plus piston-swept vol-

ume). Cast iron pistons with split skirt, made in accordance with the drawing here shown, are employed.

The cooling system includes a centrifugal pump driven from a cross-shaft at the front of the engine. A thermostatic valve mounted on the discharge pipe from the engine is arranged to short-circuit the radiator while the engine is warming up or operating below a given temperature. A G. & O. radiator is used.

Ignition is now furnished by a Berling magneto which,

however, carries a second distributor, enabling the use of battery ignition for starting. A Westinghouse starting motor is mounted just below and to the left of the clutch case. It can be easily removed by taking out the flange bolts and pulling it to the rear. Starting is effected by throwing a small switch on the dash which operates, in turn, a relay and switch in the armature circuit. The lighting generator is mounted to the right of the clutch housing and is driven off the rear end of the same shaft which drives the magneto. This construction is made possible by having the timing gears in the rear instead of in the front of the engine. A six-volt, 120-ampere-hour Vesta battery, mounted amidship in a cast aluminum cradle attached to the outside of a chassis frame is employed.

All connections between the engine and rear axle are of the squared-shaft type, long a feature of Stevens-Duryea construction. The flywheel is mounted on a tapered square instead of a flange, this construction being used for the reason that the timing gears are at the rear of the engine. Helical gears, running in oil, are employed. They are made of Fabroil and are inclosed by a plate which separates the clutchcase from the crankcase.

The powerplant has a three-point suspension, one of the early features of Stevens-Duryea construction. No underpan is used, but the space between the crankcase and chassis frame is inclosed by deep U-shaped sheet metal troughs which slope aft and have at their rear end large air discharge openings, so that louvres are not required in the hood.

The clutch is of the dry, multiple-deck type. It has seven driving and six driven plates, the former have molded Raybestos linings.

A split-type square coupling is used for connecting

Instrument board, showing wiring and method of mounting instruments and switches

The full-floating rear axle, showing separate housing for pinion shaft and its bearings, and the substantial truss-rod employed

the clutch to the transmission. By taking out the bolts which hold this coupling together and slipping back the clutch it is possible to remove the latter without disturbing other units.

The transmission used is of the same progressive type formerly employed. This is operated by a lever at the left of the driver. The lever moves over a so-called "self-finding" quadrant which is said to make it impossible to mesh the wrong gear in shifting. To the transmission has been added a Kellogg air compressor, the mounting of which is shown clearly in the accompanying photograph of the powerplant.

The universal joints are of the hollow-cross type and are filled with grease which lubricates the pins under the influence of centrifugal force. The joints, in common with nearly all other units in the car, are made in the Stevens-Duryea plant.

The rear axle is of full-floating type and spiral bevel gears are employed. The pinion shaft, with its housing and bearings, forms a separate unit which can be easily removed for bearing adjustment. Ball bearings are used throughout. The central housing of the axle is of malleable iron. Into it are pressed and brazed steel tubes. The assembly, which appears rather light for a heavy

The frame is 1 in. deeper than formerly and is made of heat-treated chrome nickel steel. Arrangement is made for supporting the body on brackets attached to the outside of the chassis frame. These are provided with taper wedges for adjustment.

The steering gear employed is practically the same as that formerly used. It is mounted to the chassis frame by a single but substantial bolt which permits the steering column to be adjusted at an angle to suit the type of body employed.

The Alemite lubricating system is used for all chassis parts requiring grease.

The muffler, which is of Stevens-Duryea construction, employs a series of conical baffles, as shown in the accompanying cut. It is supported by sheet metal hangers from studs rigidly attached to the chassis frame. The hangers are sufficiently flexible to readily take care of the heat expansion of the long exhaust pipe.

The standard equipment for all models includes a long-distance Moto-Meter with dial indicator on the dash, a combined Waltham clock and speedometer, tire rack and two rims. Cord tires, either 33 x 5 or 35 x 5, are provided all around.

The seven-passenger touring car with full equipment

The muffler, showing conical baffles and method of support by flexible hangers

car, but is said to be amply strong, is reinforced by a substantial truss-rod. Standard gear ratios are 3.92 and 4.1 to 1.

Both brakes are on the rear wheels and operate on 14-in. cast iron drums. The external brake has cast malleable shoes with asbestos fabric lining. The shoes are held against an adjustable stop in the off position. The clearance of upper and lower shoes is established by an adjustment on the top of the upper shoe, and the spring which holds the two shoes of each pair apart prevents dragging. The internal expanding hand brakes have bronze shoes made in one piece. The latter are sprung into contact with the drums on engagement by action of toggles.

The rear springs are of the three-quarter elliptic type, 57½ in. long. They are underslung and pivoted on the rear axle. The drive is taken through the front end of the rear spring, but torque and brake reaction are taken by a torque tube.

An adjustable bushing is used to take up side play and wear on the shackle at the front end of the rear springs. The bushing is screwed into the eye of the bracket, as will be noted by reference to the accompanying cut.

The front axle is of the conventional Elliott type, of Stevens-Duryea make, and has ball bearings in the wheels and ball thrusts on the steering pivots. Half-elliptic springs, 40 in. long, are used in front, and Gabriel snubbers are employed all around.

and tanks filled is said to weigh 4700 lb. The wheelbase is 138 in.

A number of body models are provided, but while these are more or less standard in some particulars, nearly all incorporate special features and are, therefore, practically custom made. They are lower than the earlier bodies, are constructed of high-grade materials and are well finished and appointed. The use of left-hand gear shift and hand brake gives a clear front compartment. The new instrument board and its fittings are shown in one of the cuts.

The price of the Model E chassis is \$5,600.

**A** LENGTHY report from the Government's department of Overseas Trade deals with the trade situation and trade prospects of China. The authors are H. H. Fox (Commercial Counsellor), and H. J. Brelt (Commercial Secretary), and they show that China, despite all sorts of adverse factors, is progressing steadily toward Western modes and usages. Included in this progress is a recognition of the need and economic value of good roads and of automobiles for connecting towns and opening up territories. Almost 5 million dollars worth of automobiles were imported into China in 1920, the great bulk of them from the United States, though British cars are an increasing quantity, which would be larger but for the high cost of the cars compared with American.

He reports favorably of the prospects of trucks which he says are coming into general use.

# A New Rotary Valve Engine

Chief advantage claimed is that of absolutely silent operation. Absence of valves and tappet rods at side of cylinder block allows location of accessories close to cylinders and a consequent narrow engine. The valve design remains the same in principle as the one first produced in 1914.

**T**HE original design of rotary valve engine developed by Eugene Bournonville was described in *The Automobile* of Dec. 24, 1914. Mr. Bournonville at that time had rebuilt a Fiat four-cylinder car, having removed the original cylinder block and substituted therefor a new block with valves of his design. We are informed that after this change was made the engine ran better and more efficiently than before, and the old car is still in use, doing truck duty for the plant. During the war, development work ceased for a while, but recently it has been taken up again, and an entirely new six-cylinder design has been created which is now in production on a small scale. By "entirely new" is meant that the design of the engine is in no way based on that of the Fiat on which the early experiments were made; the valve design, while remaining the same in principle, has been improved in many respects.

A number of sectional views of the latest design of engine, known as the Bournonville rotary six, are shown herewith. The rotary valve is located within a cylindrical casting which also forms the cylinder head, but is referred to as the valve head. The valve consists of two identical hollow cylinders located end to end, which are driven at one-sixth crankshaft speed. The drive is

communicated to the two halves of the valve from a shaft extending all the way through them, through a cross-shaped spider keyed to the shaft and engaging into slots in the valves proper, this spider being located between the two halves of the valve.

While on the subject of the valve drive, it may be well to at once describe the rest of this drive. From the crankshaft the drive is communicated to an accessories shaft through a Link-Belt silent chain which runs over a self-tensioning idler. A vertical shaft is driven from the accessories shaft through a pair of helical gears and another pair of helical gears at the top end of the vertical shaft communicates the drive to the valve shaft. A downward extension of the vertical shaft drives the oil pump of the lubricating system, and through a spur pinion on the vertical shaft near its upper end is driven an oil measuring device delivering lubricant for the valve to the stream of combustible gases entering the valve chamber. All this portion of the engine is clearly illustrated in the front elevation with cover removed, shown herewith.

Reverting to the valve head, the combustion chamber is formed in this casting and is of such form that it can be easily machined. Disregarding the cylinder port, which

A number of sectional views of the Bournonville rotary valve engine

extends vertically upward, the compression space is of the form of a body of revolution and can be machined by feeding a tool of the precise section down into it. A horizontal outlet type of carburetor is fitted to the valve head on one side at the middle of its length, and delivers combustible mixture into the passage within the valve. This mixture then flows through the passages of the two halves of the valve, to both ends of the valve, and then enters a passage, called inlet passage, which is cored in the valve head. This passage extends the whole length of the valve head, and mixture can enter it from both ends. This inlet passage is placed in communication successively with the different cylinder ports by pockets in the valve. Each half of the valve has three sets of three such pockets, each set being in line with the cylinder port of one cylinder. As the cylinder needs to be placed in communication with the inlet passage once every two revolutions of the crankshaft and there are three pockets on the same circumference of the valve, it follows that the valve needs to make only one revolution to six of the crankshaft. The same pockets in the valve which serve for the inlet also serve for the exhaust. There is one exhaust port cored in the valve head for each cylinder, and the pockets in the valve place the cylinder port in communication with the exhaust ports in the proper rotation. The very moment that communication between the cylinder port of any cylinder and its exhaust port ceases, communication between that same cylinder port and the inlet passage is established. Using the same valve for the inlet and exhaust tends to prevent excessive heating of the valve by the exhaust and at the same time to promote vaporization of the heavy ends of the fuel which may enter the inlet passage unvaporized.

#### Valve Timing

All ports and passages are accurately machined and the timing is therefore quite definite. The inlet valve opens 5 deg. past top dead center and closes 35 deg. past the bottom dead center; the exhaust valve opens 45 deg. ahead of the bottom dead center and closes 5 deg. past the top dead center. Owing to the uniform speed of rotation of the valve, the effective valve opening area increases uniformly, remains at the maximum for a while (longer for the exhaust than for the inlet valve) and then decreases uniformly. The maximum valve opening area (for a  $3\frac{1}{2} \times 5\frac{1}{4}$ -in. engine) is 1.507 sq. in. The cylinder port is rectangular in section  $\frac{1}{2}$  in. wide by  $3\frac{3}{8}$  in. long. The valve is  $3\frac{3}{4}$  in. in diameter and its peripheral speed is 187 ft. per minute at an engine speed corresponding to 1000 ft. piston speed per minute.

It is this low surface speed of the valve combined with the small clearance allowed between valve and valve bore that permits satisfactory lubrication by a small amount of light cylinder oil. The valve is ground on

its outside and the bore of the valve head is lapped out with white cast iron (malleable iron) laps and so called 15-minute carborundum lapping compound, so as to obtain a clearance of between 0.0017 and 0.002 in. By a special feeding device, one drop of oil is fed into the inlet pipe between the carburetor and the valve head for every 12 revolutions of the crankshaft. An illustration of this oil-feeding device is shown herewith. It is mounted on the gearcase at the upper end of the vertical shaft on the forward end of the engine. It consists essentially of a spur gear which meshes with a spur pinion on the upper end of the vertical shaft. This spur gear is provided with an oil pocket which fills up with oil every time it comes into register with the oil inlet passage (communicating with the regular pressure lubricating system of the engine). After a motion of a little more than half a turn the pocket in the spur gear comes into register with the delivery port communicating with the charge inlet pipe, and the oil then subject to the suction in the inlet port and is drawn into the charge stream therein, together with which it enters the inside of the rotary valve. Here the oil tends to separate out, owing to its greater inertia than the gaseous charge, which asserts itself every time there is a change in the direction of motion, and to collect in eight internal circumferential oil grooves, four in each half of the valve. From these grooves radial holes are drilled to the outside of the valve. Through these holes the oil is gradually fed at several points to the bearing surface of the valve.

#### Valve Well Jacketed

The whole of the valve head is water-jacketed, except that portion where the inlet passage is located, which does not require any provisions for cooling it. The water jacket extends around the spark plug bosses. Water enters the valve head jacket through ports communicating with ports in the top of the cylinder block and leaves the valve head jacket through two openings on top to which the water return manifold is bolted. An interesting point in connection with the production of the valve head is that the casting is made with six core print holes on the sides, and in setting the part for the boring operation it is located by means of pins from the outside of the cylindrical wall to be bored out, thus insuring uniform thickness of wall. There is a valve timing hole drilled in the valve head on top at the rear end; when this hole registers exactly with a hole of the same size in the valve, the piston in No. 1 cylinder should be in the top dead center position. When the explosion oc-

curs in the cylinder the valve has the maximum seal on both sides, viz.,  $\frac{3}{4}$  in.

The outstanding advantage of the rotary valve is its absolutely silent operation. An incidental advantage is that, owing to the absence of valves and tappet rods at the side of the cylinder block, the accessories can be located close to the cylinders and the engine made quite narrow.

# Various Methods of Chassis Lubrication

The need for convenient and adequate methods of chassis lubrication is emphasized, and the various devices and methods intended to accomplish this function are briefly described. Lubricating materials are compared.

By Cornelius T. Myers\*

ONE of the commonest experiences in our daily life is that of the efficacy of lubrication in minimizing surface friction, thereby reducing effort and operating cost as well as prolonging the life of the device. There is hardly an instance of mechanical movement among the millions of devices that surround us daily that does not depend for existence upon adequate lubrication.

The automobile industry early faced and has persistently improved the lubrication of engines, gear-boxes and rear axles because lack of good lubrication in these units was quickly followed by ominous noise and real disaster. But there are many other parts of a motor car or motor truck, commonly referred to as chassis parts, which depend on good lubrication for even reasonably long life. As temporary lack of lubricant on these parts does not stop the running of the car or make its operation uncommonly disagreeable, much less attention has been paid to their welfare, although the total of the damage due to this neglect amounts to a large sum annually.

For four or five years more and more attention has been given to the subject of chassis lubrication.

The main reason why chassis lubrication is neglected by owners and operators is because it is an inconvenient dirty job. The secondary reason is that many chassis bearings will function for a considerable length of time in spite of lack of lubrication. Sooner or later, however, they fail and often cause the early failure of other parts. Especially is this true of such parts as spring-bolts, steering pivots, clutch bearings and universal joints, where bearing pressures or rubbing speeds are relatively high.

Investigation will show a staggering bill chargeable to lack of chassis lubrication. It can easily reach \$10 per year for the average size touring car and can run above \$50 per year for a large truck in heavy service. I estimate that the charge runs about \$5 per year for 4,000,000 Ford cars, plus \$8 for 5,000,000 other cars, plus \$20 per year for 600,000 motor trucks, or a total of \$72,000,000 annually.

If proper attention were given to lubricating the chassis parts of cars and trucks, as they are built and equipped to-day, it would call for a minimum of 2 hr. per week per vehicle. At 50 cents per hr., this would bring our annual bill for attention to \$500,000,000 per year. Since this would result in saving only \$75,000,000 to \$125,000,000 per year in repairs, there is small hope that users as a whole will devote their attention to the dirty job. In other words, the inattention of the user is justified and he saves money by refusing to be bothered.

I see no reason why machines cannot be so built and equipped that 6 hours per year will suffice to give them far better chassis lubrication than most of them now receive. This would reduce the attention charge to \$29,000,000 and save a minimum of \$46,000,000 per

annum and possibly more than double that sum, which would be available to purchase new cars that would have a greater sales appeal and would be less of a service station problem.

One way to avoid lubrication difficulty is to eliminate rubbing surfaces. Recently there have been some attempts to do this, and effort naturally enough centered at points, such as the spring shackle bolts, where pressures up to 1000 lb. per sq. in. are sometimes encountered. The result of one effort in that direction is the Belflex fabric shackle. (Described in AUTOMOTIVE INDUSTRIES for Nov. 10, 1921.)

Another development which eliminates spring shackle bolts is the rubber shock insulator used on the Mack bus chassis. (Described in AUTOMOTIVE INDUSTRIES for Sept. 15, 1921.)

Fabric and rubber shackles are still in the development stage and it may be some time before their good and bad points can be evaluated by experience. Both have been tried before with indifferent success, but the applications cited above embody detail modifications which may overcome past failures. A number of years may elapse before experience enough is gained with these devices to have warranted their use on more than a small percentage of our motor vehicles. Meanwhile, we shall have with us hundreds of millions of rubbing surfaces that must have lubrication.

Self lubricated bushings are being used extensively for bearings where pressures are light and rubbing action comparatively infrequent. They serve well where they are protected from dust and moisture as in the clutch pilot bearing and sliding sleeve, steering gear post tube, etc.

Self lubricated bushings do not stand up for any satisfactory length of time under heavy or steady loads, especially where they are exposed to dirt and moisture. For spring eyes, spring shackles, axle steering pivots and steering cross rods they will stand up only when given an additional source of lubrication. Such service needs a far greater amount of lubricant than can possibly be held in the bushing. When this gives out some wear immediately takes place and the particles rubbed off become imbedded in the soft material in the bushing. The bushing then becomes a lap and begins to eat into the pin or shaft. When any wear has taken place atmospheric moisture can enter and oxidize the pin, the oxide later being rubbed off and held by the bushing. This can often happen before any other wear takes place. Further, the indentations for holding graphite decrease the load carrying area by 10 to 30 per cent. The Cleveland Graphite Bronze Co. having had experience with many hundreds of thousands of self-lubricated bushings in all kinds of service for the past 4 years, no longer recommends them except for oscillating light load bearings or intermittently rotating light load bearings.

\*Condensed from a paper recently presented before the Metropolitan Section of the Society of Automotive Engineers.

The grease or oil cups of the average passenger car are seldom given attention more than once a week, and the great majority of cars are lucky to receive such attention more than once a month. Motor trucks, when cared for under a good garage inspection system, get somewhat better attention, but the chassis bearings of thousands of trucks get but slightly more attention, comparatively, than does the average passenger car.

In gearboxes we have an instance of careful thought for lubrication in an inaccessible position. The details have been carefully worked out so that, under ordinary conditions, two fillings with moderately heavy oil per year will suffice for satisfactory service. The same practice applies to rear axles, so far as the lubrication of parts in the housing is concerned. The lubricating method in these two instances is that of retention of lubricant and exclusion of dirt, to which method the design and operation of these parts lend themselves. This also applies to wheel hubs, and might be extended to universal joints, steering-gear housings and some types of fan mountings.

### Continuous Lubrication

The lubrication of engines has been given careful and constant attention until very reliable systems have been developed. These systems are all based upon a continuous supply and wastage of lubricant, and the exclusion or removal of foreign matter. It is upon this principle that the lubrication of most chassis parts should be handled, involving a more or less continuous flow of lubricant. The more continuous this flow when the vehicle is being operated, the more efficiently will the bearing surfaces be lubricated, other things being equal. This being the case, care must be exercised to see that dirt, moisture or other non-lubricating matter is not picked up and led to the bearing surface.

Ball and roller bearings must operate behind tight closures, or at least closures that allow but a trace of moisture or dirt to enter. Bath lubrication is very satisfactory under these conditions, which are found in gearboxes, rear axles and wheels. Where the ends of bearings are in any way exposed to the elements, bath lubrication, of course, is not available, both on account of contamination and excessive wastage. A plain or bushed bearing must then be used; and to constantly maintain an oil film, preventing surface abrasion and oxidation by moisture, a clean automatic feed must be supplied.

The most important consideration in the design of the chassis lubrication devices is the choice of lubricant. Shall grease or oil be used? Each has advantages and drawbacks. Grease is stiff enough, as a rule, to be more cleanly than oil and not flow over painted surfaces near the grease cups. It lends itself to compact and simple design of cups integral with spring bolts and its firmness allows grease cups and fittings to be set at an angle or even in an inverted position, which is often very convenient where holes for the cups must be tapped in restricted locations. Some claim that grease will support heavier bearing loads, but the difference is more apparent than real. Grease can be forced by hand screws from the cups to the various surfaces. On the other hand, grease must stand under heavy indictments. It is a dirt carrier, and the methods of handling it expose it to dirt at every turn. Grease cannot easily be cleaned when dirty whereas oil can be filtered and much partly used engine oil can be used for the parts of the chassis. Another important consideration is that most greases contain considerable amounts of soap and inert matter which make them more or less stiff and heavy, but which have a negative qualification as a lubricant. Grease

does not readily spread itself in a film over the wearing surfaces, especially if it is applied when they are loaded or when cold. This offsets the apparent advantage of being able to force grease through cups or fittings for it escapes from the end of a bearing without actually spreading over the bearing surface, the appearance of the grease being a misleading sign that the bearing is properly lubricated. If all parts of a bearing are not lubricated the dry spots will soon accumulate dirt or inert matter and start a cutting action. When very cold it is almost impossible to force grease through small drilled holes and channels.

An improvement over the ordinary method of handling grease in grease cups is that of Searing. Grease is packed in small paper cartridges, which can be slipped into the cup, and the grease forced to the bearing by the thumb screw. This assures clear grease and the messiness of filling the ordinary cup is avoided.

Within the past three years a notable attempt has been made to increase the effectiveness of grease lubrication by means of pressure application. The Alemite and other similar systems are used by a large number of concerns building passenger cars and trucks. They provide a much handier and more effective way of applying grease than by means of grease cups, and have the additional merit of being comparatively inexpensive to install, even on cars in service. They have most of the failings of the older methods, however; for handling a grease container around the average chassis is always a dirty job. The fittings and hose sooner or later accumulate dirt which is forced into the bearings. When the fittings are not closed with caps, dirt and water from the washing hose will enter them. The number of times per month that individual attention is necessary is still excessive, and for the best results a special grease must be used. On such parts as wheel hubs, universal joints and radiator fans, which with difficulty retain oil and have a reservoir for a considerable amount of grease, this system is very satisfactory.

A modification of the grease gun system calls for an air-tight grease pail to which pressure can be applied by a tire pump, and the grease forced through a flexible tube to the various fittings. This eliminates the filling of the grease gun and protects the grease from dirt—a very desirable feature.

### Oil the Best Lubricant

Oil as a lubricant, has great advantages over grease, but its proper application to chassis bearings has required more painstaking design than has usually been given to it. This has previously militated against its use, especially on passenger cars, but the advantages that follow are appealing more and more to designers and to users:

Oil will maintain as heavy a gearing load as grease, and with less friction. Oil fed to one properly located point in a bearing will quickly spread over the entire bearing surface. It will flow through a very small hole, and it can be conducted a considerable distance by means of capillary attraction and surface tension. It carries much less dirt than grease, it can be filtered, and it is not nearly so much exposed to dirt when in bulk or when being applied. It contains no inert matter to clog holes and channels. The oil used in the engine can be used in the chassis oils. Oil is much more easy to apply automatically than grease. A flow of clean oil tends to clear a bearing of any dirt which it may contain, and a bearing arranged for oil lubrication can be flushed and cleaned with gasoline or kerosene. When oil is used on spring bolts the seepage works down into the spring leaves and keeps them from rusting, then stiffening and sometimes breaking.

After studying and endeavoring to improve chassis lubrication of motor vehicles, and having tried almost every kind of device and method known to-day, the au-

thor has come to the conclusion that the best results will be attained when following requirements are met:

Oil should be used (preferably engine or axle oil) unless pressures or rubbing speeds are very light and intermittent. Devices should be built into the chassis or its parts, so that they are not excesses liable to be damaged; should need attention but once in two or three months; should not require special filling attachments, which get dirty, damaged or misplaced; should feed automatically when lubrication is needed; should feed clean oil, eliminating dirt and moisture; should be simple, sturdy and have no moving parts to wear, get out of adjustment or be misplaced.

The feed should be constant when in action so as to flush the bearing at points remote from the feed opening. In general each part to be lubricated should be independent of the others so that failure of lubrication at one bearing does not affect other bearings.

The devices or system should not interfere with the accessibility of other chassis parts which may need adjustment or repair; should have a minimum number of filling points, all to be quite accessible; should not waste oil and should be as cleanly as possible.

Surprisingly small amounts of oil constantly fed will maintain the necessary film between surfaces. By choking down a copious supply to a minimum there need be but a small amount of seepage. In some cases even this need not be wasted, but can be led to another rubbing surface. Seepage from spring bolts, for instance, will gradually work between spring leaves, seepage from the steering gear housing can be led to the steering arm and from pedal shafts to clutch and brake linkages.

#### Various Oiling Devices

The last few years have seen numerous oiling devices offered for lubricating chassis parts. Among the more serviceable are the Bowen wick oil cup.

The Blooming cup operates somewhat on the manner of the Bowen, but lacks the wick. It depends on splash to feed oil through the small hole in the vertical center tube. The Madison-Kipp oil cup has a spring closed plunger which when pulled out and pressed in, forces a small charge of oil past the ball check valve to the bearing. It holds enough oil for quite a number of injections, which are easily and quickly applied.

The Van-Oiler is mechanically fed by a vibrating valve from a reservoir above to a little basin in the bottom of the cup where a constant level is maintained by the student-lamp principle. As oil washes over the edges of the basin due to car motion, it is replenished from above. The Vibra oil cup has a spring controlled valve which allows drops of oil to pass as it vibrates due to the motion of the vehicle.

One Roberts & Monroe system is similar to the Alemite except that it employs oil, usually of the grade 600 W, as a lubricant. The oil pressure is built up by means of the spring plunger and is automatically released when the hose connection is pressed into the fitting. This pressure flushes as well as lubricates the bearings, and is a great improvement over grease cups or the used variety of oil fittings.

The other Roberts & Monroe system, the Romon, is a most elaborate attempt at thorough chassis lubrication. It consists of a multiple plunger oil pump in a chamber which holds 2 or 3 qts. of oil and contains 10 to 16 plungers actuated by cams which are operated by a hand ratchet lever. A pipe from each plunger feeds the various chassis bearings, each bearing being supplied with a fitting containing a ball check valve. Once per day, or oftener if thought necessary, the driver of the vehicle operates the ratchet lever a number of times, forcing clean oil to every bearing that has a pipe connection. Whether the flexible connections to front and rear axles will stand up under continued vibration is yet to be demonstrated, while the complex piping makes a repair

job awkward and reduces accessibility. The system has great merit from the owner's standpoint, as it is handy and clean to operate.

The Myers magazine oiling system employs hollow brackets, shackles, etc., holding  $\frac{1}{2}$  to  $1\frac{1}{2}$  pints of oil, which lasts 30 to 90 days. This oil is automatically fed, in small but sufficient amount, to the various pins, shafts and bearings by means of capillary attraction and surface tension. Felt wicks reach from the bottom of the oil cavities or magazines to the tops of tubes or drilled holes down which they pass to the bearing to be lubricated. The tops of the tubes or of the drilled holes are located near the top of the magazines and the felt wicks completely fill the holes. This prevents excessive feed or loss of oil by gravity or splash, and the wicks act as filters as well as feeds. Vibration or oscillation of the bearing causes a very slow but steady flow of oil to feed the bearing which ceases when motion ceases. With loose fitting wicks there is a tendency to overfeed the bearing. This can be controlled by attachments which fit in the tube or holes and regulate the flow to suit the need. This system was used on the 20,000 Class "B" military trucks. Several magazines can be piped to one accessible filling point, and 15 minutes once in two months should be sufficient to give thorough chassis lubrication.

Wick oiling of spring bolts has recognized advantages. The Franklin car for a number of years has been equipped with hollow spring bolts into which dipped wicks that lead to the bearing surface of the bolts. Some trucks are similarly equipped, but the supply of oil which can be carried in the pin is necessarily quite limited. The clutch and brake controls of the Franklin car are also equipped with wick oiling devices; and the Lippard-Stewart light truck provided lubrication for clutch and brake controls by wicks in hollow shafts and by magazine oiling brackets.

Drag links for the steering mechanism made by the Cincinnati Ball Crank Co. are arranged so that they can be filled with oil and fed by wicks through the ball sockets to the ball connections at either end of the drag link.

Clutch sleeves, release bearings and pilot bearings have always been difficult to lubricate. Pilot bearings have for the most part been ball bearings which received little or no lubrication, and they have given very good service when dirt or moisture did not reach them.

#### Spring Lubrication

There has been some argument against the advisability of lubricating spring leaves because it lessens the damping effect of interleaf friction; but spring makers put graphite between the leaves to cut down friction, and there is no doubt but that cars ride better when new than when the springs are old and rusty. Most instruction books state that springs should be taken apart once a year and regreased, and there are numerous devices on the market, evidently in response to a demand for such things, for applying oil to springs. Among them is the Sterling oil saturated felt pad held to the side of the spring. The Dilso system calls for cupped end spring leaves, each cup containing a small oil soaked felt pad. The Anderson boot provides a complete enclosure in which grease is packed.

EDITOR'S NOTE.—The paper was concluded by quoting Norman F. Smith, superintendent of the garages of the Consumers Co., Chicago, as saying that over 50 per cent of the repairs on trucks are the result of bad lubrication. As a standard method of lubrication Mr. Smith recommended that some grease cups be filled every four or five days, and that a definite schedule be worked out, and adhered to, for filling other cups.

# State Laws and Their Effect Upon Motor Truck Sales

The tendency of many states is to bar the heavy truck from the highways either by imposing weight restrictions or through an extremely heavy tax or registration fee. The lack of uniformity of these fees stands out as a distinct feature. Present taxes should be made a part of sales studies.

STATE legislation concerning motor trucks has become so widespread and so strenuous as to be an important factor in truck selling. It is obvious that motor trucks should bear their share of the tax burden and thus pay from their earnings certain sums for maintenance of the highways which they use. Certainly, too, they should be subjected to weight and other restrictions. At the same time the truck must be recognized as an economic factor in transportation and its tax burdens and restrictions imposed with that thought in mind.

While there is a general agreement as to these facts, at least among automotive interests, state laws dealing with fees and restrictions show little evidence of any general agreement among legislators as to methods of practically or uniformly applying the principles of taxation or restrictions. Truck manufacturers have interested themselves in striving to secure a scientific study and analysis of these matters, with the result that they have pretty generally accepted the proposed Uniform Vehicle Law advocated by the Motor Vehicle Conference Committee. This committee is composed of representatives of the American Association of State Highway officials, N. A. C. C., American Automobile Association and the Highway Industries Association.

## The Uniform Law

So far as tax impositions are concerned the proposed Uniform Vehicle Law recommends that none but State taxes should be imposed on motor vehicle operation, and for this purpose only the two factors of horsepower and weight should be used. As for actual amount, the proposed Uniform Vehicle Law sets forth the following:

Equipped with	Per hp.	Per 100 lb. gross weight of vehicle and load
Pneumatic tires .....	25c.	25c.
Solid tires .....	25c.	35c.
Iron, steel or other hard tires .....	25c.	50c.

While the highway maintenance requirements of one State may make this schedule of fees unnecessarily high—while in other states they may not be high enough, nevertheless the Conference Committee believes that as a practicable working basis for the majority of states the new rates proposed are fair and equitable.

In the matter of size and weight restrictions, the following specific recommendations are set forth in the proposed Uniform Vehicle Law:

28,000 lbs. gross weight distributed not more than 22,400 lbs. on one axle nor more than 800 lbs. per in. width of tire measured between the flanges of the rim.

While for one reason or another all of the State legislatures that have given consideration to the proposed Uniform Vehicle Law since its promulgation have not

seen fit to adopt its specific recommendations in these matters of fees and restrictions, it is gratifying to know that during the course of the present year, when 42 states held regular sessions of their legislatures, many laws to a greater or less extent were passed with provision based upon the fundamental principles of the proposed Uniform Vehicle Law. Even so, a careful analysis of the various laws as they stand shows what a vital concern, in the matter of sales promotion of motor trucks, these various phases of State motor vehicle laws have.

In a certain sense every tax is an added sales resistant, as it adds so much to the original price or the operating cost of the vehicle. Thus, from a marketing standpoint the details of variations in State laws as regards fees and regulations must be carefully considered. The accompanying table, prepared from data collected by the Motor Vehicle Conference Committee, presents these variations in detail.

The sales possibilities of a given truck type and the sales resistance to be overcome, however, vary considerably from State to State because of the fees and regulations peculiar to individual territories. Twenty-one states have recently passed new laws that would increase the registration fees in those states. A study of these new laws reveals a number of points bearing upon the marketing possibilities in individual states. Certain general facts stand out clearly.

The distinct increase in each State in which a new law has been passed reaches in one State as high as 1900 per cent for a 5-ton truck, while there is an average increase of something like 432 per cent for this type of vehicle. The different bases used for computing fees render impossible an exact computation of fees, but fairly accurate comparative data can be obtained on the basis of a given typical truck. This basis of comparison is used in this article.

## Heavy Fees for Heavy Trucks

The tendency is, of course, to impose heavier fees upon the heaviest trucks. An examination of the grading of fees, in fact, indicates that the taxes have probably been devised in certain instances with the idea of taxing the heavy truck off the road. An interesting light on this topic is given by a comparison of Figs. 1 and 2.

Fig. 1 compares the cost of registering a given 2½-ton truck under the old and new laws in the states where changes have been made. Certain physical characteristics have been assumed for this typical medium-sized truck that the fees might be computed for each State. The results obtained from the 2½-ton truck are typical, in a relative way, of all trucks under 3½ tons. Fig. 2 is a chart for a 5-ton truck constructed on a similar basis. It may be said that the chart for the 5-ton job

Fig. 1—Chart showing the increased cost of registering a 2½ ton truck in the various states in which new laws have been enacted increasing registration fees. The chart is based on the assumption that the truck is of 30 hp.; has a chassis weight of 5,000 lb.; body weight of 1,000 lb.; a gross weight of 11,000 lb.; is equipped with solid tires with a width of 7 in. each and originally cost \$3,000

is typical of what would be shown for other trucks of greater weight, except that the tendencies indicated in the 5-ton chart would merely be somewhat accentuated in the case of heavier models.

A comparison of these two charts shows clearly that the percentage of increase in fees on heavy trucks is greater in most cases. The extent of this tendency is shown in the following comparative figures, showing percentage of increase on the typical 2½-ton and the typical 5-ton trucks in the various states where changes have occurred:

State	Per Cent Increase	
	2½-Ton Truck	5-Ton Truck
Florida	146	130
Oregon	75	66½
New Hampshire	365	775
Texas	56	50
North Carolina	87½	200
Pennsylvania	133½	100
Minnesota	1,100	900
Maine	133½	192
Utah	450	1,300

State	Per Cent Increase	
	2½-Ton Truck	5-Ton Truck
Arkansas	400	1,400
West Virginia	100	311
Wyoming	11	26
Rhode Island	360	300
New Jersey	38	23
Connecticut	60	150
New Mexico	60	177
Kansas	650	1,900
Montana	50	50
South Dakota	250	400
Indiana	25	87½
Arizona	50	150

An idea of the sales importance of these figures can be gained from the fact that under existing laws in the 48 states there is a difference of \$392.50 in the cost of registering this typical 5-ton truck in West Virginia, where the rate is highest, and in Louisiana, where the rate is lowest. The difference in the case of the 2½-ton truck is \$115.50 in Florida, where the rate is highest, and in Louisiana, where it is lowest. Louisiana, however, is likely to soon rise from her position at the bottom of the list, for while this article is being written the legislators in that State are considering drastic increases.

The chart shown in Fig. 1 may be properly used as a basis for discussing truck fees in general, as the truck used in making the chart gives typical results for the middle and low capacity vehicles.

Fig. 2—Chart showing the increased cost of registering a 5 ton truck in the various states in which new laws have been enacted increasing registration fees. The chart is based on the assumption that the truck is of 36 hp.; has a chassis weight of 9,000 lb.; body weight of 1,500 lb.; gross weight of 20,500 lb.; is equipped with double solid tires with a width of 6 in. each, and has an original cost of \$4,500

In this class there are two states in which the registration fee will be \$100 or more, the highest being \$123, in Florida. A fee of this size will probably be of little moment as a sales resistant in the case of certain types of sales. The big fleet owner who operates his trucks as a part of a business of considerable volume, either as a trucking company or as a transportation unit of another business, will not be greatly influenced by a fee even as large as this. A fee of even \$123 is not, of course, any appreciable per cent either of the original cost of such a vehicle or of the operating cost for a year.

In the case of the single truck buyer, however, who is likely to have little capital to begin with, a cash payment of this size may weigh materially in his determination to buy and operate such a vehicle. Even a cash payment of \$50 required of such a man at the beginning of each year is likely to act as a distinct sales resistant. And there are 18 states where the fee for this truck would range between \$50 and \$100.

As a matter of fact, an addition of \$50 or \$100 to the operating cost of any truck is a decided factor in sales at the present time, when sales depend to a greater extent than ever on low original cost and possible operation economies.

### Additional Expenses

Additional expense factors are present, moreover, in many states which tend to increase considerably the cost of operating a truck. These include the gasoline tax, which is now operating in 14 states, and personal property taxes which are imposed, in addition to the registration fee, in 35 states. If this truck were assumed to use approximately 2000 gal. of gasoline a year, this would mean an additional tax of \$20 in 13 of the gasoline tax states and \$40 in the other. The personal property tax would vary, of course, in accordance with the rate and method of assessment in each State and each locality, but it is probable that some \$11 or more would be added in this way.

These figures are, of course, pure guesses and would vary considerably in any given case, but they serve to visualize clearly the various tax burdens with which the truck salesman must contend in different instances.

An analysis of the various State laws shows extreme variation in methods of computing registration fees. There has been no systematic or uniform action in this respect, for there are no less than eight different methods of determining the fees. These methods, and the number of states having each in use, are as follows:

Load capacity .....	26
Gross weight .....	10
Horsepower .....	4
Percentage of cost .....	2
Horsepower and gross weight combined .....	2
Horsepower and load capacity combined .....	2
Chassis weight .....	1
Tire width .....	1

The states in which the fee is based upon load capacity are as follows: Alabama, Arizona, Arkansas, Colorado, Connecticut, Georgia, Indiana, Iowa, Kansas, Kentucky, Maine, Maryland (on solid tires), Massachusetts, Mississippi, Montana, New Mexico, North Carolina, Oklahoma, South Carolina, South Dakota, Texas, Utah, Vermont, Virginia, West Virginia and Wyoming.

The eight states basing their fees upon the gross weight of the vehicle and load are as follows: Delaware, Florida, Idaho, Illinois, Nebraska, Nevada, New Hampshire, New Jersey, New York and Washington.

Maryland, Louisiana, Missouri and Ohio are the four determining the amount by charging so much per horsepower, while North Dakota and Minnesota are the only

two charging a percentage of the cost. A combination of a certain amount per horsepower plus a certain amount per 100 lb. gross weight is used in California and Michigan, and the combination of horsepower and gross weight is used in Rhode Island and Tennessee. Oregon hit upon an original scheme when it was decided to base the fee upon the total width of the tires, and Pennsylvania stands alone as the State in which chassis weight is the basis.

Even the variance in the methods of determining fees, however, is but a part of the story, for no matter what methods are used practically every State charges a different sum. In a few cases the result comes out practically the same, but a glance at Fig. 3 will show the variations in the various states. The two curves showing the costs of registering a 5-ton truck and a 2½-ton truck both reach the same low point. The high point, however, is reached in different states, which might be taken as another indication that there is a tendency to charge a higher rate for heavier trucks than for those of medium weight. For example, West Virginia hits the high mark of \$400 for a 5-ton truck, while for a 2½-ton the price is \$50. The peak in the 2½-ton curve is in Florida. This chart clearly shows the differences in registration costs that were mentioned previously.

Naturally, all this would be eliminated if the proposed Uniform Vehicle Law should become effective. Its adoption in every State would result as indicated by the straight lines across each curve in Fig. 3. Thus the fee for the typical 2½-ton truck in each State would be \$36, which is \$28.50 higher than the lowest and \$87 less than the highest fees now in effect. Thirty of the 48 states charge fees above this figure for the registration of a 2½-ton truck.

The fee for the typical 5-ton truck under the uniform law would be \$80.75, which is about \$73 higher than the lowest and \$320 lower than the highest fees now in effect. Twenty-four, or exactly one-half, of the states charge above this rate.

It will also be noted that three states charge more for registering a 2½-ton truck than the uniform law would require for a 5-ton truck. Conversely, six states charge less for the 5-ton truck than would be charged for the 2½-ton were the law in effect.

It should also be noted that the proposed law recommends that the proceeds be used exclusively for highway purposes. In this connection the Motor Vehicle Conference Committee believes that these highway purposes should only include maintenance and repair of highways properly located and adequately built to carry motor vehicle transportation efficiently and economically. The Conference Committee regards as unsound and inequitable the use of such money for capital outlays involved in highway construction and reconstruction.

### Weight Restrictions

Reverting to the weight restrictions imposed by the proposed law, the Conference Committee expressed the opinion that the restrictions would be liberal enough to permit a State to take advantage of the economies which come from the use of the larger commercial motor vehicles; on the other hand, they are low enough and of such a character that vehicular travel on the highways is amply safeguarded and highway foundations and surfaces fully protected from destruction.

Leaving all such conditions aside, however, and assuming that the limitations would be effective in localities where they are needed, it is certain that the adoption of this provision of the proposed Uniform Vehicle Law would give highway engineers a definite working basis. Road construction in the future would be carried on

Fig. 3—Chart showing the cost of registering the typical 2½ ton and 5 ton trucks in the 48 states under existing laws. The heavy curve indicates the cost of the 5 ton truck, while the dotted curve indicates the cost for the 2½ ton. The straight lines drawn across the curves represent the cost of registering each truck under the Proposed Uniform Vehicle Law

with the idea in mind that trucks of the weight specified were to pass over them.

Weight limits are now imposed in 32 states and about as much variance is seen in this matter as is the case of the registration fees. In 10 of these 32 states the changes brought about by new laws have decreased the size of the load permitted. Four of these ten, however, are states in which there were no former restrictions along this line. In three states, California, Colorado and Utah, the limits have been changed so as to permit the hauling of heavier loads than were previously allowed.

It will be noted that in four states weight limits have been imposed that would bar from the highways a 5-ton truck such as is used as a typical example in this article. In the accompanying figures, however, the fee for such a truck has been computed on the assumption that it would be allowed to operate and to show what the fees would be were these restrictions removed without changing the cost of registration. These states are Florida, Maine, South Carolina and Utah.

There are various methods of determining what loads shall be carried, but the one prevalent in most states is dependent upon the width of the tire. Usually the states permit a gross weight of something over ten tons and then specify that there shall not be more than a certain number of pounds per inch width of tire. This figure ranges from 500 to 800 lb. A few states specify the number of pounds to be carried on an axle, and in 10 states greater restrictions are imposed if other than pneumatic tires are used.

A study of all these variations, not only as regards weight, but taxes as well, forces the conviction that

adoption of a uniform law such as the one proposed would produce beneficial results to all concerned. It would, however, give highway engineers something definite upon which to base their plans.

It is scarcely to be expected, however, that its adoption will be immediate. This would be desirable, but legislative action in the past has never immediately reflected anything like the best results of scientific conclusions, and it is not likely to do so in the future. The determining factor will be the necessities of economic transportation. As the motor truck further proves its usefulness and further convinces legislators that it has filled an economic need, this type of vehicle will neither be unfairly taxed nor ruled off the roads. To prove itself a proper unit of commercial transportation, its economies will, of course, be proved to overcome the cost of building and maintaining roads suitable for its use. Sufficient data are not yet available to settle the question decisively, but work along this line is being carried on and ultimately will aid in solving this complex problem.

The relation of truck design to road maintenance, the operating costs of various types of trucks under given conditions, the practical possibilities of road construction from a theoretical and a financial standpoint and other similar studies, many of which are now going on, will have a definite bearing in finally determining legislative regulations. The influence of these studies will be reflected as well in shaping markets.

In the meantime, the various factors of existing laws and the legislative trends shown by comparison with past laws should form a definite part of sales studies in connection with motor trucks.

## State Laws Governing Motor Truck Regulation

State	Date New Law Effective	Registration Fees Previously in Effect	New Fees	Weight Limits		Dimension Limits		M. P. H. Speed Limits		Gasoline Tax	General Tax
				Old	New	Old	New	Old	New		
Alabama	No new law	Tons capacity 1 and less.....\$15.00 1 to 2.....22.50 2 to 3.....37.50 3 to 4.....56.25 over 4.....75.00	No change					30	No change		Registration fee in lieu of all taxes
Arizona	Jan. 1, 1922	Horsepower 25.....\$5.00 26 to 40.....10.00 over 40.....15.00	Tons capacity 1½ and less.....\$10 1½ to 3.....15 over 3.....25						City.....10-15 Country.....30	1 cent per gallon	Personal property
Arkansas	May 1, 1921	Flat rate of \$10	Tons capacity 1 and less.....\$15 1 to 1½.....20 1½ to 2.....25 2 to 2½.....30 2½ to 3.....35 3 to 3½.....40 3½ to 4.....45 4 to 4½.....50 4½ to 5.....55 5 to 6.....60							1 cent per gallon	Personal property
California	No new law affecting fees. Amendment 1921 with respect to weight limit.	40 cents per h.p. plus the following unladen weight: Less than 2 tons.....\$5 2 to 3.....10 3 to 5.....15 5 and over.....20	No change	Maximum gr. wt. for 4 wheels, 30,000 lbs.; 6 wheels and 3 axles, 40,000; per in. width tire base, 700 lbs.		102 in.	No change				Personal property
Colorado	Amended 1921	Tons capacity 1.....\$10.00 1 to 2.....17.50 2 to 3.....25.00 3 to 4.....37.50 4 to 5.....50.00 for each ton over 5.....25.00	No change	Maximum gr. wt., 8 tons.	Gr. wt. on 4 wheels, 10 tons.		Width, 12 ft. in prairie districts; 9 ft. elsewhere.		General, 35; mountain highways, 20; curves, 18; vehicles of gr. wt. over 3 tons, 15.	1 cent per gallon	Personal property

# A Distribution Policy for the Brazilian Market

The country, as large in area as the United States, is divided into at least seven definite districts. An agency for each of these territories, instead of one for the entire nation, would facilitate distribution and selling. The necessity for studying the foreign market is emphasized. The opinions expressed are those of a salesman who spent much time in Brazil.

**E**STABLISHMENT of selling and distribution policies in foreign countries has been carried out along somewhat vague lines in the past. This condition, however, could probably not be well avoided, for in an industry as comparatively young as the automotive industry, there has not been any too much time to permit the establishment of sound methods at home. Yet, this latter has been done to a certain degree, and some stern steps have been taken in getting things on a more or less sound basis abroad.

The time is coming, however, and at no very distant date, when the American manufacturer who desires to market his goods away from home must establish definite methods in the countries he enters, and must develop the possibilities of those countries with as much care and study as he has spent in developing the home markets. The domestic merchandiser has at his finger tips the needs of practically every section of the United States and knows to a pretty fair degree of accuracy what type of automobile will sell best in California and what type is more prevalent in Maine. He knows the various degrees of prosperity which each community is undergoing and he acts accordingly. However, when he considers a foreign market he is apt to look at it as a whole and make no attempt to analyze the varying needs of the different sections there.

Exporting is increasing in volume and will increase still more in the near future. This is particularly true of South American exports. Conditions are rapidly righting themselves, and men who have spent considerable time there have declared that there is a shortage of motor cars. Recent figures showed that there were approximately 1000 cars in customs at Buenos Aires, while normally there should be about 2500 at this time, which is the opening of their sales season. American-made cars are popular in South America; they have won their way into the hearts of the Latin-Americans. The dealers there are good business men and they know what they want and why they want it. The economy and ease of operation of American cars has appealed to them, especially since gasoline is selling for something like 67 cents a gallon.

The fact that in Rio de Janeiro there are some 28 Pope-Hartford cars of the vintage of 1908 still scooting about the streets, with a new horn attached for every year of service, indicates that the South Americans are convinced that American cars will stand the tests. These old cars not only make their way about the city streets, but they may be observed climbing the difficult hills of Tijuca and bumping over the rough roads of the state of Minas. American cars have proven their ability in

that part of the continent. And there are many parts of Brazil that are practically virgin territories for the manufacturer of automobiles.

Brazil is the largest political division of the South American continent. It is larger in area than the continental United States, excluding Alaska, and slightly larger than the great bulk of Europe lying east of France. Despite this fact many American manufacturers have attempted to sell automobiles over the whole of Brazil through the establishment of one agency in the entire country.

Many, too, have tied up their foreign business with export agents. Whether or not this latter is a sound policy permits considerable discussion, but those who have made a close study of exporting methods have agreed that the manufacturer himself or his direct representative, is far better equipped to handle American automobiles in foreign countries than the export agent who may be marketing oil cloth, phonographs and a brand of canned goods in addition to the automobile.

## Divided Into States

In giving one firm the agency for all of Brazil, manufacturers have apparently forgotten that the country is divided into states similar to this country, and that there is keen competition among states there. Commercially the country has not progressed as rapidly as has her neighbor, Argentina, but it must be remembered that she is not so old from the standpoint of colonization. Brazil is also handicapped in that she has no gold standard, but that bids fair to be righted within the next year.

There are at least seven separate and distinct districts of Brazil, and the far-sighted exporter will look to the establishment of branch agencies in each of these districts. In each there is a principal city, and that city represents the center of some particular industry.

Some 900 miles up the Amazon, a journey of five days from the mouth of that river, there is Manáos, with a population of 80,000. This city is in the heart of the rubber country and practically every form of motor vehicle could be sold there. The port city for this Amazon territory is Para. The rubber industry also predominates there and the city is well equipped with docks and is an important maritime and commercial center.

To the south of Para on the coast is a city that has been practically untouched by automobile salesmen from the United States. That city is Pernambuco, an extremely wealthy city of some 150,000. The sugar industry stands out above others, although cotton is a large

crop, and trucks, passenger cars and tractors are needed. Still further south is Bahia, abounding in poor roads, rough streets and tobacco. The tobacco industry in this section is on a par with that industry in the United States and goods from there can be found in all European markets. Bahia and the country roundabout have not developed to the extent of other districts, but plans are under way for much road work. The market there for cars and motor trucks is not yet as good as in other sections. However, the market for tractors is fair, and the coming of cars and trucks will, without doubt, force the building of better roads and improvement of streets. There is another city between Bahia and Rio de Janeiro which is not included as a headquarters for one of the districts, but which is of more or less importance nevertheless. This city is Victoria, the coffee center. Its streets are rough and atrociously kept. Only light cars exist there, but there are opportunities for development.

Next along the coast comes Rio de Janeiro. The possibilities of this city are too well known to cause much discussion. In fact, many exporters have seemed to consider Rio de Janeiro a good big part of Brazil and conclude that when they have supplied the market there they have about supplied the Brazilian market. It is, of course, the most important city of the country, but not by any means the only important one.

To the south of Rio de Janeiro there is the city and state of São Paulo, where numerous industries abound. Coffee, cattle, cotton growing, cotton factories and packing plants are in the district, and, generally, it is the commercial center of the country. This is a state where crops can be grown three times a year and on the mountain tops and sides rice grows wild. The city is typically American and English is spoken almost as much as Portuguese. The section is unusually wealthy and offers a market for all types of cars, trucks and tractors.

The last district is the state of Rio Grande do Sul, sometimes called the "Iowa of Brazil." The state is wealthy in agricultural products and the principal city

there, Porto Alegre, is the center of the rice industry. There are many other prosperous cities about Porto Alegre, including Pelotas, Rio Grande do Sul and Blumenau.

### Progressive Developments

There is much more that could be said about these districts, enough, in fact, to fill a book of travel, but the brief outline presented shows a few of the possibilities in Brazil if a careful plan of distribution were worked out. Each of these cities serves a territory that is rich and still in the process of development. There is more road building going on in Brazil than in any other country of South America. There are reasons for this, however. In the first place Brazil possesses all the necessary materials for this work. Secondly, the government is determined to open up the interior of the country and thus far has been successful in their attempt. They are lending every possible aid to promote road building.

Agriculturally, Brazil is progressive. Tractors are wanted and wanted badly. Brazil will pay the transportation charges, or furnish the transportation for tractors in order to get them down there. The government controls the steamship line, Lloyd Brasileiro.

Unlike some other South American countries, the duty on trucks in Brazil is low, being only 5 per cent ad valorem. It must be remembered, however, that on city streets dual tires are required and chains are forbidden. In the country, however, trucks are being used for all purposes and chains may be used.

The motor car in Brazil has advanced beyond the pleasure stage, and the many people there regard it as a necessity. Chauffeurs, taxicab drivers and owners take better care of the motor cars than they do in the United States.

Coming back to the distribution problem, the situation in Brazil is much the same as in the United States, so far as territory and the number of industries to be served are concerned.

## German Automobile Exports for 1920

**D**URING 1920 there were exported from Germany automotive vehicles, chassis and airplanes of a total weight of 437,400 Doppel-centner (220 lb.), and 31,906 Doppel-centner of parts. The number of complete vehicles exported was 17,534 and their value, 1,184,295,000 marks. The value of the parts exported was 89,912,000 marks. In addition there were exported 3,541 motorcycles, valued at 25,564,000 marks. The figures for complete vehicles show a large increase as compared with the last full year before the war (1913) when the number of exported passenger cars and trucks combined was only 9,848. There was only a slight increase in the exports of motorcycles, however, from 3214 in 1913 to 3541 in 1920, and also only a slight increase in the exports of parts, from 25,679 Doppel-centner in 1913 to 31,906 in 1920. The distribution of Germany's exports in 1920 is shown by the following table, the figures representing Doppel-centner.

German imports of automobiles in 1920 were of very little consequence. There were imported 223 passenger cars and chassis for same, as compared with 1830 in 1913; 124 trucks and chassis for same, as compared with 159 in 1913, and 50 motorcycles, as compared with 503 in 1913. It is not unlikely that most of the trucks imported were intended for the Armies of Occupation and do not represent commercial imports.

### German Exports of Motor Vehicles, Chassis and Dirigible Aircraft

Country of Destination	Complete Vehicles (Units of 220 lb.)	Parts (220 lb.)
Belgium .....	7,532	2,083
Denmark .....	32,451	2,057

## Neglect of Details in Finishing a Car

Editor, AUTOMOTIVE INDUSTRIES:

I have had some interesting experiences with a certain 1921 six cylinder car and I believe that a discussion of them will prove interesting to readers of AUTOMOTIVE INDUSTRIES. On the whole the car has been extremely satisfactory, but it certainly has failed in a great many trifling ways which, however, have much to do with the pleasure and profit of motoring.

There are two things that particularly stick in my crop at this moment. One is the fact that as far as I have been able to discover, it is impossible to buy a single headlight lens simply because headlight manufacturers prefer to sell a man two new ones when he breaks one. This is an imposition that is going to force me to put in plain lenses of the Ford style rather than be played for a sucker.

The other thing that particularly annoys me is the difficulty of obtaining a single leaf for an automobile spring. As you know, when a spring fails, usually only one leaf gives way. But it is not an easy matter to buy a single leaf, particularly from an automobile dealer. I am informed by the dealer who sells my car that he has tried very hard to purchase individual leaves, but spring makers are reluctant to sell single leaves because it is more profitable to force the unfortunate owner to purchase a complete spring when he breaks a single leaf.

Engine, clutch, transmission and axles, and other important units on this car are perfect, after some 12,000 miles of use, but the details might be improved without the expenditure of very much cash. Take the case of headlights, for example: both small and large sockets have had to be replaced because they were made out of aluminum instead of brass, and this metal was so soft and the general construction of the socket was so faulty that the sockets became useless after a few thousand miles. The doors to the headlights are hinged at one side and retained by a snap catch on the other side. These catches were defectively designed, with the result that a severe shock would jar open the doors. The wiring of the headlights was so skimmed that it was impossible to open the doors more than part way. This in itself was an inconvenience, and, due to frequent jarring open of the doors, the wires soon became chafed away and new wiring was therefore necessary. The conduit system in which this wiring was enclosed is so laid out that the job of removing just one headlight wire required one hour, and the replacement of this particular wire took just as long. Five cents of improvement at the right points would have eliminated all this trouble, and trouble it was. It is no fun driving with lights that are flickering and threaten to go out any minute. A man must be able to place confidence in his lights, and this has only been possible since the car has been re-wired. The taillight socket, by the way, was also replaced.

The latches in the door locks were originally of cast bronze and these cracked one by one with the result that all four locks on the car had to be replaced. It was not

possible to buy new latches, but complete new locks had to be purchased.

A right rear spring broke in the main leaf, close to the front spring bolt, and a complete new spring had to be purchased because it was impossible to obtain a single leaf except by ordering it from the spring maker. Because of difficulties in disassembling and assembling this spring, including the bad fit of the bolts it took two good mechanics six hours' hard work to do the job, and the running board apron was mutilated in the process, because it was impossible to withdraw the front spring bolt without knocking a hole in the running board apron.

Casual inspection of the under side of the car one day disclosed the fact that none of the cotter pins on either the service or emergency brake had been spread. I discovered to my horror that the cotter pin on the clevis pin connecting the service brake rod to the pedal had dropped out and that the clevis pin itself was almost ready to drop out. Any automobile manufacturer who fails to spread cotter pins ought to be jailed!

The service brake mechanism is so laid out that it is impossible to adjust the brakes so that they will hold well and yet not drag when five people are in the car. If they are adjusted to give maximum stopping ability, they will drag with five people in the machine almost without exception.

One other thing that is worth mentioning, is that the high tension ignition wires are wrapped around the end of the engine and that every once in a while the heat melts off enough rubber on one of the wires to short circuit some spark plug. The spark plugs, by the way, are placed so close to the under side of the exhaust pipe that it is almost impossible to screw one in or out without burning your fingers, and, in fact, in performing this operation, the shell of the plug actually touches the pipe. Care must be taken in connecting a spark plug to prevent the high tension current from jumping to the exhaust pipe.

There are many other points that need attention. If you want my private opinion, I think that this particular company tried conscientiously to build a good car and all the units are good, but they failed because they have never really finished the job. Details which cause the owner trouble and expense have not been given proper attention.

HAROLD F. BLANCHARD.

## Relation of Gearset Construction to Economy

Editor, AUTOMOTIVE INDUSTRIES:

Since your issue of November 17 requests comments on the fuel economy question, the view of an outsider may be of some interest. Of all the articles which have appeared on this subject the one in which Mr. Nelson described the results of tests using high axle ratio seems to offer the largest gain in economy. This gain was obtained without the use of any special constructions.

The chief obstacle preventing the universal attainment of economy in this way is the difficulty of making

gear changes, except at low speed. The noise of the intermediate gears in present-day transmissions is also an objection.

If the constant mesh type of gearset were made with herringbone gears it would be practically noiseless. If an individual clutch of small size were used to bring the members of the positive jaw clutch to the same speed before engagement, gears could be changed easily and noiselessly at any speed.

If the American driving public is to learn economy before it becomes a necessity the all-high-gear car must be replaced by a more economic type which can be easily handled by the ordinary driver. A silent overdriven fourth speed would add economy to the virtues of most of our present-day cars without sacrificing performance.

## Counterbalancing Two-Cylinder Vee Engine

Editor, AUTOMOTIVE INDUSTRIES:

I have a problem in automotive design which I hope you will be able to solve for me.

I have built a two-cylinder engine from certain Curtiss Model OX parts, utilizing the first two cylinders. These two cylinders project radially from the crankshaft, and are set at an angle of 90 deg. The motor is of 4 in. bore and 5 in. stroke. It was built, but developed excessive vibration. Of course, due to the displacement of the cylinders, the explosions did not occur 360 deg. apart, but varied from 360 by this 90 deg.

I believe the vibration is due to a lack of crankshaft counterbalancing, and I now desire to counterbalance the crankshaft. The complete piston, connecting rod, and bolt assembly weigh  $4\frac{3}{4}$  lb. apiece. The questions I desire answered are these:

1. In counterbalancing, is only the offset weight of the crankshaft considered, or is the weight of the pistons compensated for?

2. What weight of counterbalance and what shape are necessary to counterbalance this engine? L. R. L.

In a two-cylinder 90 deg. Vee engine the so-called primary components of the inertia forces due to the reciprocating parts in the two cylinders combine to make a constant, uniformly rotating force which can be balanced completely by the application of balance weights to the crank arms, and only the secondary components of the inertia forces, which rotate at twice the speed of the crankshaft, cannot be balanced. The value of the constant rotary force which is the resultant of the primary components of the inertia forces on the two sets of reciprocating weights is

$$F = 0.0000142 W l N^2 \text{ lb.,}$$

where  $W$  is the weight of the reciprocating parts of one cylinder (piston, piston pin, rings, pin locking screw and one-third of the weight of the connecting rod);  $l$  is the length of stroke in inches and  $N$  is the number of revolutions per minute.

This force must be balanced by the centrifugal force on the balance weights, which is

$$F' = 0.0000284 W' N^2 r,$$

where  $W'$  is the weight of the balance weights required for this purpose, and  $r$  the average distance of this weight from the axis of rotation. Hence,

$$0.0000142 W l N^2 = 0.0000284 W' N^2 r$$

from which it follows that

$$W' r = W l / 2$$

The lower ends of the connecting rods are rotating weight and they are virtually centered at the center of the crankpin. As already stated, these lower ends are generally

considered to represent two-thirds of the total weight of the rods. Hence, if the weight of each connecting rod is  $W''$ , the rotating weight of the connecting rods is  $4 W''/3$ , and as this weight is located at a distance  $l/2$  in. from the axis of rotation, its moment around this axis is

$$4 W''/3 \times l/2 = 2 W'' l/3$$

This also must be balanced by the balance weights and the weight required for this purpose is  $W'''$  where

$$W''' r = 2 W'' l/3$$

In addition the balance weights must contain weight sufficient to balance the offset parts of the crank itself, that is, part of the crank arms and the whole of the crank pin. The moment of these parts around the center line of rotation should be carefully determined from the drawing of the crankshaft, and weight should be provided in the balance weights to equal this moment. Suppose that the unbalanced moment of the crank is found to be  $A$  lb-in.

The two balance weights must then be made of such moment around the crank axis that the centrifugal force on them will equal combined effects of inertia on the reciprocating parts, centrifugal force on the lower ends of the connecting rods and centrifugal force on the unbalanced parts of the crank itself. The moment, therefore, should be

$$W_l r = W l/2 + 2 W'' l/3 + A,$$

where  $W$  is the weight of the reciprocating masses of one cylinder, including one-third the weight of the connecting rod;  $l$  is the length of stroke in inches;  $W''$  is the weight of one connecting rod and  $A$  is the moment of the unbalanced portion of the crankshaft around the crankshaft axis.—Editor.

## Wants Manufacturers to Adopt Standard Gear Shift Positions

Editor AUTOMOTIVE INDUSTRIES:

Almost every issue of your paper carries something about standardization of various parts of the automobile. I notice in your issue of November 17th you have an article on transmission standardization.

Why don't the automobile manufacturers get together and standardize the gear shift? Practically everything else has now been taken care of with this exception and it is very confusing to a man driving different cars. At the present time I have a Buick and a Cadillac, and am continually getting the two shifts confused. Most of the cars are now using what is called standard shift, that is, the same as that used on the Cadillac, but there are several, such as the Buick, Dodge, Hupp, etc., with distinctive ones. Can't something be done to standardize these and help the drivers? R. B. LINSLEY.

## Passenger Car Body Standards

THE Passenger Car Body Division of the Standards Committee of the Society of Automotive Engineers is working on proposed standard specifications for door handles, plate glass, leather, door hinges, fender irons, nickel plating, rolled sections and moldings, top irons, wood screw drills and windshield side arms. The Division is also preparing definitions of the various types of passenger car bodies now in common use.

G. W. Kerr, chairman of the Sub-division on Leather, believes that the formulating of standard specifications covering the thickness of leather, the thickness of buffing, and allowable imperfections and methods of grading, is one of the most useful things the Division can at present undertake. Representatives of a number of prominent leather manufacturers are co-operating to this end.

## Market Analysis Data

THE work of the Bureau of Foreign and Domestic Commerce has been described in detail and automotive manufacturers are rapidly recognizing the service which this bureau and its automotive division may render.

The Bureau of Census is another agency to which the manufacturer may well give attention in connection with his domestic marketing studies. This Bureau, as well as the others which form a part of the Department of Commerce, has been thoroughly reorganized. Its figures and studies in the past have been routine to a large extent and its industrial figures, in particular, have been published so long after the date to which they refer as to be almost useless for practical business purposes.

To meet the current needs of business, however, a monthly survey of production and stocks is being published by this Bureau with the assistance of various trade associations. This summary should be of direct value to the automotive industry.

The bureau has recently issued, as well, surveys of

different cities, showing the ownership and encumbrance of homes in the given cities. These brief reports show the number of homes, the number of owner occupants, the number of mortgaged homes, the average market value of mortgaged homes and a number of other detailed facts along this line. Such data is of very practical value to the automobile sales manager, who is interested in intensive market analysis.

Doubtless the Bureau of Census will publish other material of similar value. It will be worth while to follow its work rather carefully and to profit by the studies which it makes.

## The Owner to the Manufacturer

WE hope every automobile manufacturer will read the letter entitled Neglect of Details in Finishing a Car, which appears in this week's Forum, and pass it on with instructions that it be read by responsible persons in the engineering, production, inspection, purchasing and service departments. The letter contains a message from an intelligent car owner who deserves to be heard. Present car owners are future car purchasers and the manufacturer who persistently refuses to heed just criticism on the part of the owner will, sooner or later, lose, and deserve to lose, his business.

In the case cited, assuming that each of the departments concerned were given a reasonably free hand, it would appear that the engineering department was at fault for making a poor wiring layout, for so locating the running board apron that the spring bolt could not be readily removed, and the spark plug too close to the exhaust pipe, and for the design which made it impossible to prevent dragging brakes. Probably the production department was at fault for a wiring job that made it impossible to open the headlamp doors, and for poorly fitted spring bolts. Certainly the inspection department should not have passed the defective wiring and should have seen that all cotterpins were in place, before the car left the factory. No doubt the purchasing department (possibly with the expressed or tacit consent of the engineering department in the form of inadequate specifications) was responsible for the cheap headlights with poor catches and the unsatisfactory door latches which broke and required early replacement. The inability to buy single headlamp lenses or single spring leaves indicates a shortsighted service policy.

So we find that a lack of attention to details, manifest in a number of different departments or due to carelessness and a lack of proper thought or co-operation, resulted in spoiling what would otherwise have been a very satisfactory car. We fear that similar shortcomings are characteristic of many cars produced in large quantities. The purchaser is expected to stand the grief, and the consequent expense which the lack of thoroughness entails, when a few dollars spent in cleaning up these troublesome details would have saved the purchaser a much greater expense not to mention the delays and annoyance which gives him just ground for complaint and causes him to be a critic rather than a boost to the car.

Doubtless the car was never built at any price which is entirely free from certain annoying troubles, but we venture to state that a very large percentage of purchasers who have owned and operated cars would willingly pay the few additional dollars which it might cost if greater care and thoroughness were used to assure him reasonable freedom from the petty annoyances and delays which are caused by carelessness somewhere in the factory. The service station can and often does care for such troubles, but usually not until they have annoyed the purchaser and made him more or less dissatisfied. How much better (and probably less expensive, in the end, to all concerned) it would be if the difficulty were cured or prevented altogether by exercising proper care in all departments of the manufacturer's plant.

## Transformation of Hydrocarbon Fuels

OUR present motor fuel and the fractions of crude petroleum immediately below it in the scale of density consist of a series of hydrocarbon compounds which differ comparatively little in chemical composition but vary materially in their physical properties. As far as heat values are concerned, there is almost no difference when the comparison is made on the weight basis, and on the volume basis the heavier members of the series are even superior. As regards chemical composition, the lighter members contain slightly more hydrogen and less carbon than the heavier members. If it were possible to easily and cheaply convert the heavier into the lighter members of the group, not only could the possible supply of motor fuel be greatly increased, but the fuel could be better adapted to present-day engines.

The transformation indicated evidently can be made in two different ways, viz., by eliminating some of the carbon in the heavier fractions or else by adding to their hydrogen components. As the hydrogen and carbon are chemically combined it means in either case a breaking up and a re-formation of the molecules. The first-mentioned process is now in practical use and is known under the name of cracking. The heavier fractions of petroleum distillate are subjected to heat and pressure, which break up the molecules, cause some of the carbon to separate out in the form of coke, and convert the fuel into hydrocarbons of higher volatility, the proportion of hydrogen to carbon atoms in the molecules being greater. While commercially successful, it is understood that this process gives considerable trouble from coking in the apparatus.

The second plan, that of combining additional hydrogen with the hydrocarbon molecules, has not been practically developed so far as we are aware, but the fact that German chemists have succeeded in "hydrogenating" naphthalene, a hydrocarbon compound of another series makes it appear possible to also "hydrogenate" the paraffin hydrocarbons. There are comparatively little differences between the heats of formation of the different members of this series, the more volatile members having the greatest heat of

combination on the weight basis. The transformation is effected by a catalytic process, in which the elements to be combined—in this case the hydrocarbon of low volatility and hydrogen gas—are brought together in the presence of a third substance, a catalyst, which has the property of favorably influencing their chemical activity. Such catalytic processes are now extensively used in industrial chemistry, notably in the synthetic production of ammonia. The catalyst used for many of these processes is iron, which, being a common metal, renders the process relatively inexpensive. In this way acetylene gas can be combined with additional hydrogen to form a new hydrocarbon, which is liquid at ordinary temperatures and is said to be similar to Pennsylvania petroleum.

It would seem that the possibilities of transforming the heavier into the lighter paraffin hydrocarbons by means of catalytic hydrogenation should be looked into if they have not already received the attention of our petroleum chemists.

## Who Will Make the Buses?

TRUCK manufacturers are the logical makers of motor buses. As this potential field develops, truck manufacturers should be in a position to supply its needs and to reap the resulting profits. There is a general feeling among experts that specially designed chassis will be necessary for satisfactory bus work and that considerable research and experiment will be necessary before suitable designs are developed. If this development is left to agencies outside the industry, to these outside agencies will properly accrue the bus business.

Some truck makers have already recognized this fact and are doing considerable work along bus lines. One executive, for example, stated recently that "we have decided that there are three big fields for truck sales well worthy of our serious consideration and we are going to exploit them for all they are worth. We have in mind the school bus field, the roadmaking industry and the motorization of electric railways. We believe that potential sales here are very great."

An executive of a big parts concern, interested in bus development, stated recently that he did not think the truck industry was fully alive to the possibilities of the bus field and that he feared they would awake some morning to find that outsiders had stepped in and taken the business of this growing field. The subject is worth serious consideration in any case.

## Legislation and Trucks

ATTENTION is called to the tables accompanying an article in this issue on "State Laws and Their Effect Upon Motor Truck Sales." These tables contain the latest available information on registration fees, size, weight and speed restrictions, gasoline taxes and other impositions laid down in the various states. The data show the tendency in many states to attempt to rule heavy trucks off the highways.

These tables should furnish interesting information to the truck manufacturer or sales manager.

# Making Ready for Post-Show Sales

## Car Manufacturers Add to Inventories

### Export Trade Also Contributes to Keeping Parts Business to October Level

NEW YORK, Nov. 29.—While November production of motor cars undoubtedly will show a total less than for October, the business of parts and accessory manufacturers this month will hold close to the level of last. This somewhat paradoxical situation probably is due to the fact that car makers are replenishing their inventories in preparation for the business which will come with the New York and Chicago shows. In many instances they are preparing to bring out entirely new models or make improvements in the old lines.

The parts makers have been frankly surprised at the volume of orders this month. They looked for a lean thirty days and feared a long, hard winter. In many cases, sales the first third of the month fell off as expected, but after that there was a rapid and substantial increase both in releases and new business. Equally gratifying is the fact that many plants already have booked substantial orders for December.

While preparations for post-show sales are responsible for a part of these purchases of units and accessories, another factor has been the increase in foreign trade. There has been a distinct betterment in export sales this month, especially for the past fortnight, and as a consequence it is probable production for the last two weeks will exceed the first two. This business is beginning to take up the slack, or the final 10 per cent, which means profits.

The rapid rise of the pound sterling has made possible the sale of American made motor vehicles in all the English-speaking countries. Sales have been larger also in northern Europe as well as in Australia and the Far East. There has been some improvement in South Africa and in certain parts of Latin America. Business in Mexico has held its own. Trade in Latin America has been helped by the fact that this is the real selling season there, but general conditions are improving.

## OCTOBER SALES OF M. A. M. A. MEMBERS SHOW DECLINE OF LESS THAN 5 PER CENT

NEW YORK, Nov. 28.—Sales by members of the Motor and Accessory Manufacturers Association for October showed a falling off of approximately \$1,000,000, as compared with September, but the decline was less than 5 per cent. This showing was much more satisfactory than was expected, because it was believed production of motor cars last month would be considerably curtailed.

It is a striking commentary on the stability of the automotive industry that October marked the eighth successive month in which the volume of business of the parts and accessory manufacturers was practically the same. Beginning with March, which showed a gain of 93 per cent, as compared with February, the greatest fluctuation for any month was in June, which showed a decrease of 15 per cent over May. Increases were reported in July, August and September, but the change from the preceding month in each instance was less than 2 per cent.

The total of notes outstanding reported for October showed a decline of 5.82 per cent. This reduction was almost identically the same as was reported in August and September. The figures for each month this year follow:

Month	Total Purchases	Per Cent Change	Total Past Due	Per Cent Change	Total Notes Outstanding	Per Cent Change
January	\$6,264,587	.....	\$8,099,727	.....	\$4,359,871	.....

The position of the larger passenger car manufacturers in relation to inventories is steadily improving and every effort is being made to get them straightened out by the turn of the year. Many already have written off their losses. There is no disposition on the part of the stronger companies to evade their commitments with suppliers, although they are asking price concessions.

## Signal Motor Corp. Files Incorporation

DETROIT, Nov. 28.—The Signal Motor Corp. has filed articles of incorporation and will continue the manufacture of the line of trucks formerly made by the Signal Motor Truck Co. at the Detroit factory. The new company has a capitalization of \$85,000 which is based upon the assets purchased from the receiver of the Signal Motor Truck Co. The officers of the new company are: President and treasurer, M. B. Hoagland; vice-president, H. S. Sternberg; secretary, H. H. Emmons; assistant treasurer, J. C. Dibsall. The directors include the officers and J. L. Dryden and W. K. Hoagland.

Production of the new line will be started at once. The models will be the same as in the past except for refinements. Reduction in prices already has been announced.

## Michigan to Act on Durant Request to Sell Stock Dec. 1

LANSING, MICH., Nov. 29.—Application of the Durant Motor Co. of Michigan for permission to sell stock in this State has been taken up by the Securities Commission and a hearing will be given on Dec. 1. The company seeks permission to market \$5,000,000 worth of common stock at \$10 par with commissions which are not to exceed 15 per cent.

The Michigan company is one of the four subsidiaries of Durant Motors, Inc., and soon will begin production of cars for the middle section of the country. Stockholders of the parent company as of May 12 when 507,572 shares of the authorized 1,000,000 at \$10 had been issued were: W. C. Durant as trustee or members of his family, 234,271 shares; R. H. Collins, 10,000 shares; A. B. C. Hardy, 1950 shares; A. H. Sarver, 1775 shares; F. W. Hohensee, 1000 shares; G. H. Hannum, 2000 shares; Fred W. Warner, 1100 shares, and T. W. Warner, 10,000 shares.

## DURANT ANNOUNCES PRICES

NEW YORK, Nov. 29.—The following prices have been announced on the Durant Six which will be made by the Durant Motor Car Co. of Indiana at the Sheridan plant in Muncie: Roadster \$1,600, touring car \$1,650, coupé \$2,250, sedan \$2,400.

# Parts Contracts Again Looming Up

## Violations Charged Against Car Makers

Feeling Grows That Action  
Should Be Taken to Rem-  
edy Situation

NEW YORK, Nov. 28.—Indifference to contractual relations on the part of motor car manufacturers has again become a question of importance, according to manufacturers of parts and accessories. The complaint is made that with the exception of solidly established companies in the vehicle building field, there has become apparent a disposition to disregard obligations and resort to shrewd horse trading methods.

### Customers Seek Releases

Several parts makers have complained recently that customers have sought release from contracts on one plea or another and then gone into the open market to buy the same supplies at more advantageous prices. Another practice which is said to have become more or less common, is to threaten that unless sharp price concessions are made on old commitments, the purchaser will shift his business to some other house. In the present era of keen competition threats of this character have in many cases carried considerable weight.

The following statement on this subject was made by one of the largest and most substantial parts makers in the country:

"We are of the opinion that the position taken by many of the motor car manufacturers is indeed an unjust one, and works a hardship on the parts manufacturer. For example, considerable expense is incurred by the parts maker in soliciting manufacturers business. He is successful in receiving a contract, but instead of that being an asset, as it should, it becomes a liability.

### Assumes Arbitrary Position

"The parts maker covers on material, has same shipped into his plant on what he believes is a bona fide release; conditions change somewhat and the automobile manufacturer slows up his production and immediately wires the parts maker to hold up shipments. He has no regard for the contract which is entered into with you nor for the release he has given you. He takes the arbitrary position that unless shipments are withheld, he will discontinue the use of your product, that you are not cooperating with him, etc. Should you contemplate shipping him material ready, he will advise you he will refuse to accept shipments.

"The parts maker has gone to considerable expense in making up patterns and is losing money on the initial order for parts, expecting to realize his profit, however, when the customer uses a fair quantity of his prod-

## HARDING IS INVITED TO N. A. C. C. DINNER

NEW YORK, Nov. 29.—President Harding has been invited to speak at the annual dinner of the National Automobile Chamber of Commerce which will be held Monday evening, Jan. 9, while the automobile show is in progress here. The invitation has been based on the ground that the automotive industry is the second largest in the country and that the dinner would afford the President an opportunity to carry a message of good cheer to the country on the revival of business.

A real turn for the better is expected soon after the first of the year. He has been told that the great transportation industry is filled with enthusiasm and that an address from him would inspire new confidence and determination to progress.

The conference on the limitation of armaments undoubtedly will have been ended by that time and an address here would give him an opportunity to discuss the success of the international parley.

uct. The material is in his plant, which he has been compelled to pay for. Product is in the process of manufacture; he has paid for the labor in making up the parts in question up to that given point. If he stops the manufacture of those parts at the first operation, it only means he must carry same along in his warehouse, hoping that some day the manufacturer will give him a release; that is, if by that time he has not changed the dimensions or design of same.

"His inspection department is more rigid and in order not to make his liability too great, he rejects parts which would have been acceptable in normal times to them.

"When the question of payment for material, which he has received, is brought up for consideration, he first delays payment of same, and then he wishes you to take notes or trade acceptances in payment, and in many instances, requests dating besides the paper settlement.

"We believe the parts maker should insist on his contract and teach the automobile  
(Continued on page 1096)

## CORINTHIAN MOTORS FORMED

PHILADELPHIA, Nov. 28.—The Corinthian Motors, Inc., this city, incorporated under the laws of Delaware, will manufacture the Corinthian, a 4-cylinder passenger car equipped with a Wisconsin motor. The company is directed by Charles B. Lewis, president and engineer, formerly of the Lewis Motor Truck Co. of San Francisco, builder of the Lewis truck.

## Will Build Knight Engine 20 in Pontiac

Operations at Elyria Plant Will  
Be Continued for Other  
Models

TOLEDO, Nov. 29.—Gradual realignment of production and scaling down of costs is seen in the announcement of Vice-President Charles B. Wilson of the Willys-Overland Co., here that all model 20 Willys-Knight engines will be built in Pontiac, Mich., at the plant of the Wilson Foundry & Machine Co., a corporation which was formed and developed by Wilson as an ally of the Willys-Overland organization.

These engines have been produced in Elyria. The iron castings have been made in Pontiac and aluminum castings in Toledo. Now the whole process is brought to Pontiac. The model 88-4, of which there is not such a large demand, will still continue to be turned out at Elyria.

The change will take effect Feb. 1, 1922.

The Elyria plant will be retained by Willys-Overland Co. It was taken over from the Edwards-Knight Co., when Willys secured the Knight motor franchise. The engines for the new Knight motored Republic passenger bus will also be made at Elyria.

The Willys-Overland plants at Toledo will be closed on Dec. 15 for the annual inventory which it is estimated will not take more than two weeks this year. The results of the New York automobile show are expected to govern the production after the middle of January. Plant officials hope to get back to 750 daily production.

## Alfred Named to Assist in Directing Willys Sales

TOLEDO, Nov. 28.—Joseph H. Alfred has been appointed assistant sales manager of Willys-Overland, Inc., a position newly created. He will have direction of the operations of the branches of the company and of general sales promotion and sales development work throughout the dealer organization.

Alfred has been assistant comptroller of the company for the last two years and during the three years previous served as Willys-Overland traveling auditor.

F. H. Thompson, formerly traffic manager of the company, will continue to act as direct assistant to A. C. Barber, sales manager. Leo I. Longfellow, manager of the car order department, has had his field of duties greatly extended.

## Navy Advertises Old Battleships

### Ford Has Proposed to Buy Vessels to Obtain Metal from Them

WASHINGTON, Nov. 28—Efforts of the Navy Department, through a canvass of steel makers, shippers, builders and scrap dealers of the country to organize a large salvage company for the purpose of salvaging old war vessels, has renewed interest in the recent efforts of Henry Ford to purchase these vessels.

The automobile manufacturer has made a proposal to take ships of this type for the purpose of dismantling them and using the metal in the manufacture of tractors and automobiles. While the proposal has not yet assumed definite form, the Navy Department already has begun an advertising campaign to dispose of a large tonnage of old battle ships, cruisers, destroyers, monitors and yachts. Added to this list would be four battle ships and six cruisers in the event the American proposal of disarmament is adopted.

#### Salvage Company Proposed

Recognizing that the purchase and salvage of these ships would require an enormous capital, the department has in mind the suggestion of interesting private capital to incorporate a salvage company. Whether or not Ford would be willing to enter into such an undertaking with other interests is a question, and by some is considered doubtful, but it is believed he might be ready to take a large part of these ships and do his own work of salvaging. The Navy Department does not want to engage in any of the work of salvaging itself, but is proposing to sell the ships "as is," leaving it to the salvage interests as to how the ships shall be disposed of.

In this connection, it is thought that it would be feasible to adopt the plan used in England. Under this system, the vessels are purchased for salvage, taken to shelving beaches and dismantled, the metal being disposed of to steel makers and used in the open hearth furnaces for the manufacture of steel. In addition to the steel in the vessels, there are large quantities of non-ferrous metals, such as copper, and also high grade Scotch boilers and machinery. While some of the latter is not of a commercial type, part of it can be used in industrial plants.

## Yellow Cab Doubles Production Schedules

CHICAGO, Nov. 28—The manufacturing program of the Yellow Cab Mfg. Co. for the year 1922 will be double that for the year 1921. The company states that this increased production schedule and greater efficiency on the part of employees enable it to reduce prices on its taxi-

## BUSES CARRY 15,000 MONTHLY IN TOLEDO

TOLEDO, Nov. 28—Motor buses on Toledo streets are carrying approximately 15,000 passengers a month at the present time. There are nearly 70 buses in service. Many developments are expected in the next few months.

cabs, effective Jan. 1, 1922. No orders are being accepted for delivery during the months of November and December. Deliveries are being made, however, on orders already on file.

Cash prices on Model O, five-passenger brougham taxicabs, effective Jan. 1, according to the number purchased, are as follows:

Cabs		Chassis	
1 to 10.....	\$2,340	1 to 10.....	\$1,440
11 to 25.....	2,290	11 to 25.....	1,390
26 to 50.....	2,240	26 to 50.....	1,340
51 and up....	2,200	51 and up....	1,300

The new prices represent a reduction of \$400 on fleet orders. Prices of extra equipment have also been greatly reduced and in some instances extra equipment has been included as regular. Special Timken-Detroit axles and Continental engine are used on the cars.

## Body Builders to Hold Exposition in January

NEW YORK, Nov. 28—The Automobile Body Builders Association will put on a motor car body exposition in the Twelfth Regiment Armory, this city, Jan. 9 to 14. Although the show will run concurrently with the national automobile show it will have its own distinctive features. One of the purposes will be to visualize the economic importance of the body builders as a group. Another will be to make it easier for automobile manufacturers by drawing up practical specifications, and also easier for the body engineers to adopt the most advanced ideas.

The exhibits will be confined to commercial and passenger car bodies and to the materials used in fabricating them. Bodies of every type will be shown. Some will be finished and trimmed while others will be unfinished, making possible an examination of framing, metal-ling and other constructive features. A large number of entries for the show already have been received.

#### HOLM RADIATOR BANKRUPT

MILWAUKEE, Nov. 28—The Holm Radiator Corp., manufacturer of radiators for passenger and commercial cars, tractors, farm lighting plants, etc., has been declared a bankrupt, and Victor L. Gleans has been placed in charge of affairs as trustee. Liabilities are given as \$36,118 and assets of \$67,244 are claimed. The concern was established about 18 months ago. H. H. Holm is president and W. V. Simmons secretary.

## Court Approves Sale of Portage

### Seiberling Purchase of Plant Goes Through Following Action of Stockholders

CLEVELAND, Nov. 28—Following the action of stockholders in withdrawing their petition of protest, Federal Judge D. C. Westenhaver in this city has approved the sale of the Portage Tire & Rubber Co. to Frank A. Seiberling, president of the Seiberling Rubber Co., a \$55,000,000 Delaware corporation.

#### Stockholders Agree

AKRON, Nov. 28—Stockholders of the Portage Tire & Rubber Co., who protested against the sale of the company to Frank A. Seiberling have withdrawn their petition and agreed to the sale. It is stipulated that Seiberling shall set aside \$750,000 worth of stock in the recently incorporated Seiberling Rubber Co. and to hold this stock 30 days subject to purchase by Portage stockholders on the basis of two shares of the preferred and five shares of the common for \$250.

Seiberling will pay \$800,000 for the Portage plant and will buy the inventory at its appraised value of nearly \$1,000,000. He will incorporate the Portage company for \$800,000 preferred and \$750,000 common and also will incorporate the Lehigh company at New Castle, Pa., for \$750,000 common. Production of the new Seiberling tire will be started within 30 days.

#### Asks to Sell Stock in Ohio

COLUMBUS, Nov. 28—The Seiberling Rubber Co., of which Frank A. Seiberling, former president of the Good-year Tire & Rubber Co. is the head, today applied to Arthur L. Stewart, commissioner of securities, for authority to issue and place on sale \$5,000,000 in preferred stock and 500,000 shares of no par common.

Commissioner Stewart has dispatched examiners to look over properties at Akron and New Castle, Pa., which Seiberling proposes to purchase with money raised from sale of the stock.

## Mitchell Down 10 Days for Inventory Taking

RACINE, WIS., Nov. 28—The Mitchell Motors Co., Inc., has reduced its force from 60 to 70 per cent for about ten days in order to facilitate inventories and balancing of stocks. Usually this recess is not taken until about the middle of December. It is expected that former schedules will be resumed the early part of the month.

The new model of the Mitchell Six, known as the F-50, is regarded as the best product the factory has ever turned out and is meeting with an excellent response among distributors and dealers.

## New Foreign Cars Reach Far East

### Italian, German and French Makers Conduct Vigorous Sales Campaign

LOS ANGELES, Nov. 28—European automobile manufacturers, especially the makers of Italian, German and French cars, are directing vigorous sales campaigns in the Far East and are meeting with considerable success, according to W. J. Grinnan, trade emissary of Pacific Coast interests, who recently returned from a year's tour of Japan, China, Straits Settlements and the Dutch East Indies. While American cars have a very firm hold in the overseas Pacific markets and enjoy a very good reputation, the stiff European competition that is developing threatens to cut materially into the American trade.

#### Germany Ships Opel

In Japan, Grinnan says, the prohibitive sales tax imposed last April has almost completely stopped the sale of the large high priced cars. Automobile dealers and owners are organizing vigorous opposition to the high taxes and it is now considered likely that they will be modified.

The first shipment of Opel cars from Germany was received in Tokio recently and created wide interest. The Opel is described as of typical German production, very solidly made, with transmission amidships, transmission brake, and both torque tube and radius rods. Japanese enclosed bodies will be fitted.

The large Italian car, Isotta-Fraschini, fitted with the first eight-cylinder-in-line engine to be seen on the Japanese market, was recently imported by a Tokio firm. The Isotta is declared to be one of the best Italian cars, and the eight-cylinder model is fitted with four-wheel brakes and other modern refinements.

#### Fiat Goes into Japan

The Fiat Co. is reported to have shipped about 100 automobiles of different types into the Japanese markets during the last few months. A. J. Sutermeister, general agent for the Far East of the Fiat Co., is quoted as saying that his company at present is paying much attention to turning out open cars, usually four seaters, which can be placed in the Japanese market at the price of about 5000 yen.

The new Eco, expressly designed for the Australian market, is receiving considerable notice not only in Australasia but also in the Far East. The car was especially designed to meet high temperatures, bad roads and lack of available water for re-filling the radiator during long trips. Also, the high cost of gasoline in Australia has been taken into consideration. The new car has an improved and enlarged cooling system, better springs, ample water capacity and is declared to be more economical to operate than the average auto-

## HIGHER FREIGHT RATES WILL FORCE TRUCK USE

ATLANTA, Nov. 28—Leading sand and gravel dealers of the Southeast testifying before the Georgia Railroad Commission here in the hearing for increased freight charges, declared that if rate increases are permitted the carriers the sand and gravel industries of the State will have to use motor trucks entirely for transportation. The increases sought would make freight charges in excess of the value of the material if granted.

mobile. The Eco has been assembled of American parts and it is planned to make future assemblies in Australia, using American components.

## Studebaker-Wulff Buys Business of Rotary Tire

ZANESVILLE, OHIO, Nov. 28—The Studebaker-Wulff Rubber Co. has purchased the Rotary Tire & Rubber Co. which has been in the hands of a receiver. The creditors will be paid in full and Rotary stockholders will have an opportunity of taking stock in the new company.

While the debts of the Rotary Tire & Rubber Co. will be paid in full by Studebaker-Wulff, they will be deferred over a period of five years. The plant will begin producing tires about Dec. 1.

Peter E. Studebaker is president of the company. The vice-president and general manager is B. F. Wulff, formerly assistant district manager of the Kelly-Springfield Tire Co. at San Francisco and Chicago. H. C. Buchanan, director and superintendent, was formerly production superintendent of the Akron plant of the Kelly-Springfield Tire Co. The secretary and export manager is F. A. Rendon, previously export manager for the Lee Tire & Rubber Co.

The Rotary Tire & Rubber Co. was organized in January, 1918, and equipped a factory in this city for the manufacture of both pneumatic and solid tires. Before the plant was well into operation the post-war readjustment began to effect them adversely and they were thrown into receivership.

## Old Timers to Dine in New York on Jan. 9

DETROIT, Nov. 28—The Old Timers' Club, which was reorganized last year during automobile show week in Chicago, will hold its first annual New York dinner on Monday evening, Jan. 9. This meeting promises to be a distinct novelty, since the "S. S. Flotilla," restaurant, at 55th Street and Sixth Avenue, has been engaged exclusively for the Old Timers and their guests, and all speeches and other forms of banquet forensics are barred.

## Starts to Revise New Revenue Law

### New York Senator Introduces Bill to Create Tax Commission

WASHINGTON, Nov. 28—Enactment of the tax bill at the extraordinary session of Congress has proved such a disappointment that already a movement is under way to set it aside next year by another revision of internal revenue laws. Senator Calder of New York has introduced a bill to create a tax commission in this country which would be empowered to study the whole question of internal taxation and report to Congress at the earliest possible moment.

This commission would be authorized to investigate the effect upon Federal revenues of tax-exempt State and municipal securities, and possible methods of Federal taxation of such securities; to investigate the effect of the existing differences in law between the Federal taxation of individuals and partnerships and of corporations; to investigate the taxation of expenditures and the reduction of the tax rates upon savings, as means of raising revenue, stimulating thrift, and redistributing the burdens of taxation; to investigate the effect of income and profits taxes upon the accumulation and investment of liquid capital; and to make from time to time such recommendations as it deems advisable pursuant to such investigations and to report on or before the first Monday in December of each year to the President of Congress as to its activities.

It is significant to note that Senator Calder told his associates that "the tax bill is a disappointment to the people of the country, particularly the men who have looked forward to its enactment in the hope that it would inspire the business men of America to renewed activity."

## Martin Urges Guides to Aid Night Flyers

CHICAGO, Nov. 28—Glenn L. Martin, president of the aircraft company of Cleveland, bearing his name, in an address before the Chicago Rotary Club said that some kind of government aid to aviation was needed.

"We need airplane signals or lighthouses every 15 miles to guide night flyers," Martin said. "Within 15 years airplanes will be going between all our larger cities at a speed in excess of 100 miles an hour, with a death rate no higher than that of the railroads at the present time."

"The motor truck uses between four and six gallons of fuel an hour and travels about 15 miles carrying a load equal to half of its own weight empty. This is about 50 per cent efficient. Airplanes are now 40 per cent efficient, measured by the same standard, using as much as 20 gallons of fuel an hour, with an average speed of 100 miles an hour. Soon it will take only 7 hours to fly from Chicago to New York."

## Goodrich Makes Big Cut in Inventories

Also Reduces Bank Indebtedness in Nine Months—Goodyear Current Assets \$67,000,000.

NEW YORK, Nov. 29—In the first nine months of this year inventories of the B. F. Goodrich Co. were reduced from about \$72,000,000 to \$38,000,000. This reduction necessitated increased production to maintain adequate inventories in finished products.

During the same period the bank indebtedness has been reduced by over \$23,000,000, and it is expected that the company will have entirely liquidated this indebtedness by the end of the current year. The company's balance sheet as of Sept. 30, 1921, shows current assets and liabilities as follows:

Assets: Cash in bank and on hand, \$2,298,041; United States Liberty Loan and Canadian Victory bonds, \$41,242; bills receivable, \$978,872; trade accounts receivable, after deducting reserve to cover doubtful accounts, discounts and allowances, \$19,524,219; other accounts receivable, \$433,943; raw materials, partly manufactured and finished stock, \$38,294,325; total, \$61,570,642.

Liabilities: Bills payable, \$5,900,649; accounts payable, \$3,994,555; sundry accrued liabilities, \$1,875,234; total, \$11,770,438.

Since the period noted, the company states it has been able to increase its cash balance to approximately \$3,500,000 and has reduced its bills payable to about \$3,100,000 as a result of additional inventory liquidation. Notwithstanding the reduced volume of business the company expects to make a satisfactory showing of its earnings for the year.

### Goodyear Balance Sheet

Balance sheet of Goodyear Tire & Rubber Co. as of Sept. 30, 1921, showed current assets of \$67,000,000 or \$10,000,000 in excess of \$57,500,000 aggregate bonds and debentures outstanding. Under sinking fund provisions of these securities the \$57,500,000 liabilities which they now represent will be turned into that much added book value, approximately \$60 a share, for the common stock.

From profits each year the company must take sufficient funds to retire \$1,500,000 first mortgage bonds and at least \$1,363,600 of the debentures. Interest saved on the debt thus retired must be used to purchase prior preference stock at not over 110.

In 10 years more than \$30,900,000 of value should be added to common stock through retirement of prior liens. This would be equivalent to \$35 a share on the 885,474 shares of no par common stock outstanding.

### WELBORN CORP. FORMED

KANSAS CITY, Nov. 28—The Welborn Corp. has been incorporated under the laws of Delaware for \$4,000,000, of which \$1,500,000 is preferred stock and

has acquired the business of the Coleman Tractor Co. Frank I. Welborn is president of the corporation. The other officers are Earl L. Woods, long associated with tractor manufacturers, vice-president and general manager; Arthur Coleman, originator of the Coleman tractor, secretary, and Louis N. Burns, for thirty years identified with tractor work, merchandising counselor. They, with Roland Hughes, constitute the board of directors.

## Indiana to Investigate Standard Oil Co. Rates

INDIANAPOLIS, Nov. 29—U. S. Lesh, attorney general of Indiana, has determined to institute an investigation of the Standard Oil Co. under a complaint that the corporation is selling gasoline on a smaller margin of profit here than elsewhere and at a price lower than independents can meet with the purpose of stifling competition.

The chief question at issue is whether the Standard Oil Co. established a 1-cent profit margin instead of 2-cent as had been its practice and that of independents because of the superiority of its marketing organization or as a direct attempt to stifle competition. The inquiry will determine whether State and national anti-trust and restraint of trade laws have been violated. If a special investigator finds cause for action Lesh will confer with the Federal authorities and ask their co-operation in legal action which will be instituted.

## Majority of Tire Makers Oppose Mileage Guarantee

NEW YORK, Nov. 29—Eighty-six tire manufacturers representing more than 90 per cent of the total production in this country have given their approval to the recommendation of the executive committee of the tire manufacturers' division of the Rubber Association of America for the elimination of mileage guarantees and the substitution of the new form of warranty.

There has been considerable speculation concerning the probable course of the B. F. Goodrich Co., which was one of the pioneers in the mileage guarantee movement but this company is one of those which have approved the warranty plan and the elimination of guarantees.

## Plant Used by Packard for Testing to Be Sold

DETROIT, Nov. 30—The plant formerly occupied by the Packard Motor Car Co. for testing Liberty engines will be sold at auction to-day together with a large store of materials and complete power house equipment. The plant consists of three one-story, concrete buildings containing 60,000 sq. ft. of floor space and 200,000 sq. ft. of concrete-paved yard space with a loading platform on the Michigan Central Railroad. The material to be offered includes a large quantity of steel of various kinds.

## Says Lincoln Owes \$4,500,000 Taxes

Government Files Claim Growing Out of Manufacture of Airplane Engines

DETROIT, Nov. 28—Through the collector of internal revenue in Detroit, the United States Government has filed in the office of the clerk of the United States District Court, in which the Lincoln Motor Co. receivership proceedings are pending, the claim of the Government for \$4,500,000 additional income and excess profits taxes.

Ralph Stone, president of the Detroit Trust Co., receiver, explains that this claim is based upon profits of the Lincoln Motor Co., a Michigan corporation, arising out of the manufacture of Liberty airplane motors during the war. The Lincoln company already has paid to the Government \$4,126,000 taxes on these profits, this sum having been arrived at by agreement with the War Department.

### Expect Deductions Allowed

However, the Treasury Department reopened the case, says Stone, "and without admitting the settlement made by the War Department, is making claim for these additional taxes without reference to the allowance for amortization of the plant and other property agreed to by the War Department.

"Subsequently, the Lincoln Motor Co. of Delaware was organized to enter the automobile manufacturing business, and took over the property of the old company and assumed its debts. It is the position of the present Lincoln Motor Co., and likewise its receiver, that the matter of the government profits tax is settled and adjudicated and that the agreement with the war department is binding.

"A few days ago the receiver and its attorney made representations to the commissioner of internal revenue and his solicitor in Washington and arranged for a hearing in the matter, which will be held as soon as the present appraisal of the property by appraisers appointed by the United States District Court is finished.

"The receiver believes that when the facts respecting the value of the property in 1918 and at this time are laid before the commissioner, the treasury department will allow the deductions admitted by the war department and that the present additional claim will then be practically wiped out. The receiver also takes the position that whatever claim is finally established, if any, is a general claim against the assets of the present Lincoln Motor Co."

### Ancillary Receiver Named

WILMINGTON, DEL., Nov. 28—William H. Joyce of Dover, Del., and the Detroit Trust Co. of Detroit, Mich., have been appointed Delaware receivers for the Lincoln Motor Co. of Detroit, a Delaware corporation. The appointment was made in the United States District Court on the application of William H. Murphy, a stockholder, and indorser of the company's paper.

## Hoover Outlines Department Plans

### Meets with Business Paper Editors—Discusses Government Publications

WASHINGTON, Nov. 28—Plans of the Department of Commerce to increase its usefulness to American business were outlined to-day by Secretary of Commerce Hoover and Dr. Klein, head of the Bureau of Foreign and Domestic Commerce at a conference of these officials with members of the National Conference of Business Paper Editors, of which AUTOMOTIVE INDUSTRIES is a member.

Forty-six business paper men, including a number of publishers, spent several hours in conference with Secretary Hoover and his commercial assistant and also with Fred M. Feiker, assistant to the secretary. Discussion centered on *Commerce Reports* and *Survey of Business*, two publications of the department.

*Commerce Reports*, which formerly contained reports from United States consuls and commercial attachés in various parts of the world, is being steadily improved in its usefulness to American business by getting better field reports from the department representatives abroad and by technically editing these reports when they are received. Circulation of this publication is now about 12,000 a week and it is desired to build it up to 25,000 or 30,000.

#### Editors Make Suggestions

*Survey of Business*, which has been coming out monthly with indexed tables of conditions in various business and industrial lines, is to be given more of an editorial than a statistical character from now on except that each third issue will carry for a quarterly period the statistical information previously carried every month.

The editors made a number of suggestions for improving both *Commerce Reports* and *Survey of Business* and Secretary Hoover and his assistants agreed to carry them out.

Secretary Hoover gave some interesting information about the activities of the commodity chiefs of the department appointed under the new administration to study American industrial and commercial conditions and co-operate with industrial and commercial leaders in improving them. These commodity chiefs are spending fully half their time in the field conferring with and assisting men in industry.

As an evidence of the demand for assistance from the Government in directing individual business affairs, he said that trade inquiries are now averaging 1000 a day.

#### COLLEGE STARTS COURSES

LANSING, MICH., Nov. 28—The department of farm mechanics of the Michigan Agricultural College will give four

truck and tractor courses this year each of which will be divided into four units of one week each. The subjects taken up will be gas engines, tractors, ignition and electricity, and trucks. Two hours a day will be devoted to lectures and discussions and five hours to laboratory work. The dates for the courses follow: Nov. 28 to Dec. 23, Jan. 9 to Feb. 3, Feb. 6 to March 3, March 6 to March 31.

### Wetmore-Reamer Sells Controlling Interest

MILWAUKEE, Nov. 28—The principal owners of the Wisconsin Tool & Supply Co. have acquired the major interest in the Wetmore Reamer Co. and consolidated offices and operations at the Wetmore plant in this city. The merged concerns will continue under the name of Wetmore Reamer Co. Officers are: President and general manager, Edward J. Waltzer; vice-president, Charles G. Forster; secretary, Charles F. Puls, Jr.; treasurer, Carl A. Forster; general superintendent, Edward D. Johnson.

The Wetmore company will continue to specialize in the production of expanding reamers for high speed and quantity output work, adding a line of expanding machine reamers under 1 in. which have been developed under the new management within the last six weeks. The manufacture of tools, dies, jigs, fixtures and thread gages will be continued as well, with additions to the line developed by the Wisconsin company's engineers, who remain associated with the enterprise in its consolidated position. The Wetmore company is about to undertake an aggressive sales campaign in all automotive and machinery manufacturing centers of the United States.

### Conditions Spotty in Chicago District

CHICAGO, Nov. 28—Business conditions in the automobile industry in the Chicago territory, including the northern half of Illinois and a section of Indiana, Michigan, Iowa and Wisconsin vary widely.

Conditions in Illinois are dependent upon the banks, some of which have plenty of money and are backing the dealers. Banks in the villages appear to be loaded up with paper and are not in position to finance farmers regardless of how well secured they may be. In the northern end of Illinois, where dairying is the chief industry, conditions are unusually good.

City conditions are especially encouraging. There are many instances where dealers are entirely sold out, while there are others where dealers have a number of used cars on hand.

#### MAIBOHM SALE POSTPONED

TOLEDO, Nov. 29—The reorganization sale of the Maibohm Motors Co., which was to have been held to-day, has been postponed until Dec. 12 because of the filing of a Federal tax claim.

## Fisher Body Plant Opens in Cleveland

### New Unit of General Motors Represents Outlay of \$10,000,000

CLEVELAND, Nov. 29—What is generally regarded as one of the most important developments of the year in the automobile industry here came with the announcement that production had been started in the mammoth plant of the Fisher Body Ohio Co.

This mammoth plant, which is controlled by the General Motors Co., has been in course of construction for many months and it represents the expenditure of approximately \$10,000,000. The plant is situated in the eastern part of the city, near the big plants of the Chandler Motor Co. and the Cleveland Co.

The actual delivery of bodies will start this week. The week also marks the formal entry of General Motors as a production unit in Cleveland. The first completed body to come out of this plant will arrive on Wednesday, Nov. 30, and the management says that it will come through on scheduled time. The body will be delivered to the Chandler Motor Car Co., which is only two blocks away.

#### Working on Chevrolet

Chandler bodies until the present time have always been built in the Detroit plant of the Fisher Body Co. From now on they will be built in the Fisher plant here. So will all bodies for the Cleveland Co. The bodies delivered by the Fisher company will be upholstered in Chandler and Cleveland plants. These companies will require a month or so in the finishing process so that the Fisher company deliveries are scheduled to commence a month ahead of the actual 1922 schedules.

It also is understood that the Fisher plant has commenced work on the 1922 schedule of the Chevrolet company.

New departments of the big establishment are being opened every week, and it is expected that the entire plant will be tuned up for steady production by the middle of January or a little later. Actual work in the plant commenced in October and workmen were turning out material that could be supplied and for which there was urgent need. Since the time work was started material has been assembled until now all is ready for the production of bodies for the 1922 schedule.

It was learned, however, that the new plant starts out with many orders on the books and with prospects that are exceedingly bright. On account of the advantages of railroad distribution which this city offers, it was stated that bodies for cars made in cities more accessible to Cleveland than to Detroit will be transferred to this city and the Detroit plant will handle contracts on which deliveries can be made more expeditiously and with less expense than from here.

## New American Prices May Affect British

Questioned, However, If Corresponding Drop Can Be Made in View of Conditions

LONDON, Nov. 18 (*By Mail*)—Estimates of attendance at the recent Olympia and White City Motor Show vary, but there is reason to believe that it exceeded last year's attendance by about 35 per cent. On the most crowded day it was reported that 70,000 people had passed the turnstiles.

In view of the dissatisfaction resulting from holding the show in two sections it would not be surprising if a show next year were abandoned. If such a decision is made it will probably be the prelude to an alternative show every second year. Such a policy has many more supporters now than when first broached.

### Optimism Continues

Now that the show is over and people are able to estimate its results the fact is emphasized that while the dealers ordered freely actual sales to the public were relatively few. The optimism apparent at the show continues but it is more indicative of activity in outside trade than of anything that immediately attaches to the automobile trade itself.

The reason is obvious for the automobile trade reflects the state of other industries and of the national trade at large, a fact testified to recently by the failure of the truck show to elicit orders; such few as did pass being mostly from municipal and public service bodies. Reports from the car makers in the Midlands inclusive of Birmingham, Coventry and Wolverhampton point to an expectant revival of demand early in the New Year. There is the further reason for not expecting an indication of renewed activities in the trade, in the fact that makers, due to past experience, have become cautious concerning the stability of dealers' orders.

### Anticipate Overseas Demand

The great factor looked for, however, is revival of the overseas demand, and as this trade will begin to declare its value after the turn of the New Year, it is probable that the rate of exchange will then have so risen as to affect the competition of America in these markets, as well as in the British home market. To-day the Chevrolet four-five seater at £260 is the cheapest competing car in Britain, and with the present rise in the dollar-pound value, obviously it stands to gain appreciably. The effect must tend to pull down British car prices, though probably there will be little change before the season opens about the middle of March.

If American importers mark down their cars corresponding to the improved exchange, possibly this step will be hastened even before the British output is

scheduled, but considering the tight financial state of the bulk of British firms, it is a problem if a retaliating move by way of a corresponding price drop can be possible. The hoped-for reduction of the automobile license fee and the new concession as to dating a license actually from the period it is taken out no doubt will help the home situation, but far more depends on the portents of better trade in the industries on which the car side of the industry depends for its prosperity.

## Places Responsibility on Truck Manufacturer

NEW YORK, Nov. 29—F. W. Fenn, secretary of the motor truck committee of the National Automobile Chamber of Commerce, has sent a bulletin to members informing them that the Connecticut highway and motor vehicle authorities have ruled that any person desiring to register a commercial motor vehicle for an increase over its rated capacity must obtain from its engineering department a certificate to the effect that in the opinion of the manufacturer such vehicle is capable of being safely operated under all conditions at all times when loaded to the increased capacity. The bulletin says:

"It is possible that the granting of such a certificate would constitute a warranty against possible mechanical failures in the motor vehicles resulting from the overloading authorized. Moreover, in case of accident arising from the operation of such an overloaded vehicle, the manufacturer issuing such a certificate might be liable for any injury to persons or damage to property.

"Members should further realize that by issuing such certificates they place themselves in the position of sponsoring or even fostering the overloading evil which the truck committee has been steadfastly opposing."

## Production Is Doubled on New Jordan Model

CLEVELAND, Nov. 29—The announcement of the new Jordan model, it is stated at the factory, has doubled production at the plant in this city.

The Jordan company is regulating production to meet the requirements of distributors, thus preventing an accumulation of finished cars. The production for October and November will exceed by 30 per cent the total production of the third quarter of the year. Confirmed orders from distributors indicate that production for the fourth quarter will be about twice that of the third quarter.

### POSTPONE BETHLEHEM HEARING

PHILADELPHIA, Nov. 28—The hearing in the application of Calvin E. Woods, receiver for the Bethlehem Motors Corp., for permission to sell the plant at Allentown, Pa., before Judge Dickinson in United States District Court this morning, was postponed until Dec. 7, at 10 o'clock. In the meantime, it is expected that there will be a meeting of creditors of the corporation in Allentown.

## Milwaukee Industry Shows Few Changes

While There is Tendency Toward Decline Some Manufacturers Increase Sales

MILWAUKEE, Nov. 28—"Although the general tendency during the last three to four weeks has been toward a falling off in production and sales, one Milwaukee concern making motor vehicle power plants reports a 20 per cent gain in sales in this period, and another making automotive parts a smaller increase for the period, but a gain of 133 per cent over the corresponding period of 1920." says the current issue of *Business and Financial Comment*, issued monthly by the commercial service department of the First Wisconsin National Bank, Milwaukee's largest bank. It continues:

"The manufacturing and business situation in Milwaukee presents few important changes since last month. The number employed in the metal trades, 25 firms reporting, decreased from 9935 in September to 9541 in October, but in November there has been a gain of 2 to 3 per cent. A slight improvement has taken place in iron and steel castings.

"The number of men employed in metal working industries other than iron and steel increased 21 per cent, indicating that a substantial improvement is going on here. It is quite apparent from a survey of Milwaukee industries that the stocks being carried by manufacturers are within the limits that the volume of sales warrants. Makers of iron and steel products are carrying stocks averaging three to four times current monthly sales, which is a normal proportion for the industry."

### Weather Affects Sales

Retail sales were unfavorably affected in the last week to ten days by the first prolonged spell of freezing temperatures this winter, which was accompanied by light snows. As usual, this has been discouraging to many prospective buyers, for in previous years, when the season was open until December, November sales were always of fair proportions, while reactions, such as this year, invariably followed similar climatic conditions.

Enclosed car business is holding up well and sustaining former ratios to open car trade. The effect of enclosed car week is abiding. Trade admittedly is quiet, but generally speaking, dealers express themselves as satisfied because activity is of greater proportions than most of them had expected.

### TO USE SEVERIN INVENTORY

KANSAS CITY, Nov. 28—The Metropolitan Motors Corp., organized to take over the assets of the old Severin company, has decided to use the inventory on hand in the manufacture of cars. It is understood there are on hand enough parts to make 300 cars which will be sold for about \$900 cash.

# Parts Makers Join in Service Plan

## Will Open Stations Early in New Year

### Cost of Maintenance Will Be Borne by Manufacturers Who Participate

DETROIT, Nov. 29.—A combined parts service plan will be inaugurated soon after the first of the year by the leading unit parts makers. The preliminaries of the plan have been practically completed and definite steps are being taken to locate satisfactory service stations in the larger cities of the country.

Uniting in the plan will be at least one manufacturer of each important unit entering into the construction of a motor vehicle. A second manufacturer of any unit can join in the movement only with the consent of the first company to accept the plan. The cost of maintaining the stations will be borne proportionately by those participating.

### To Carry Complete Stocks

The purpose of the plan is to provide general parts for all replacements and to supply them with the least possible delay. Stations and substations will be so located that any unit will not be more than six hours distant from any place in the United States. Each station will carry a complete stock of all parts used in motor vehicles with particular attention to those subject to the hardest wear.

Prices on the parts will be fixed by the factories and will be uniform in all sections except for differences resulting from shipping costs to points far removed from the factories. Field men will keep in constant touch with the stations to see that stocks and prices are maintained as required by the factories.

The principal stations will number about 40 and each will have six substations. This would mean a total of 280 stations in operation under the plan. Each will be locally owned and operated except for the conditions as to prices and stocking set up by the unit parts makers.

In planning the inauguration of the new service system, the factories are working in close co-operation with the manufacturers in specialized unit vehicles.

### DODGE ESTATE REDUCED

DETROIT, Nov. 30.—Taxes and unpaid bills will reduce the estate of the late John F. Dodge from an approximate value of \$26,000,000 to \$15,000,000, according to Edward A. Barnes, a trustee,

who testified before Judge Richter in connection with the settlement of the estate.

The court declared legal the settlement of the protested will which had been agreed upon by the heirs outside of court. By this agreement, John Duval Dodge will receive \$1,600,000 in cash. Payments of \$1,000,000 each will be made to Mrs. Matilda Dodge, the widow; Winifred Dodge Grey, Isabel Dodge Sloane, Frances Matilda Dodge and Daniel George Dodge, either in cash or property.

## Manufacturers Prepare for Post-Show Business

(Continued from page 1086)

It is becoming apparent that buying is less on a hand-to-mouth basis than it has been for some time. This bespeaks confidence in the future, but it means primarily a belief that prices of most of the materials which go into the manufacture of motor cars are as low as they will go for some time, at least. The stronger manufacturers have liquidated much of their past due merchandise indebtedness and are discounting current bills.

The feeling is growing that the industry is getting pretty well shaken down. Companies in a comparatively strong position soon will go ahead while those which are weakest will succumb. It is likely another year will see a material reduction in the number of companies in the field. This applies both to passenger car and truck makers. Several are in a precarious position at present. While there will be failures, there also will be combinations and consolidations.

Bankers are practically unanimous in their contention that there are too many companies in the field. They have unkind things to say about the business acumen of the industry. It will be harder in future than it has been in the past to get bank backing for new automotive enterprises. Pooling of resources will be fostered by bankers both in the automobile and tire fields. They see ahead a period of exceedingly keen competition with a survival only of the fittest.

### BRAENDER RECEIVERSHIP LIFTED

RUTHERFORD, N. J., Nov. 28.—Judge Charles F. Lynch in the United States District Court has discharged the receivership under which the Braender Rubber & Tire Co. has been operating. The company has been incorporated for \$1,100,000 and is increasing its tire production 66 2/3 per cent and tube production 400 per cent.

## Receiver Appointed for Gary Motor Truck

### Petition Charges Company Is Insolvent—Plant May Be Reopened Soon

GARY, IND., Nov. 30.—G. H. Semmes of this city has been appointed receiver of the Gary Motor Truck Co. upon a petition filed by William H. O'Donnell, owner of 125 shares of preferred stock valued at \$12,500. The receiver was named by Judge Crites of the Hammond Superior Court. His first official act was to close the plant here and announce that it will remain closed until he can "get a line on the business."

The company, which was incorporated in Indiana in 1915, has a capital of \$1,000,000 in common, of which \$615,000 has been issued and \$75,000 in cumulative preferred. The capacity of the plant is 10 trucks a day.

The petition charges that no dividends have been paid for a year, that the company is insolvent and that it is unable to pay insurance or taxes. The books show a loss of \$80,000 from Jan. 1, 1921, to Oct. 31. It is asserted that the company is unable to pay its debts and that \$50,000 is due on a mortgage. The company made six trucks in October and sold only eight.

Frank Dawson is president of the company.

Notwithstanding the court order, it is believed here the plant will reopen in a short time. F. R. Schaaf, bank president and president of the Gary Chamber of Commerce, has announced that his organization will support the company officials in efforts to resume operations.

## Robert McLaughlin Dead: Founded Carriage Company

DETROIT, Nov. 30.—Robert McLaughlin, founder of the McLaughlin Carriage Co., Ltd., at Oshawa, Ont., which later became the nucleus of the General Motors of Canada, Ltd., is dead at his home in Oshawa.

The carriage business was founded in 1869 and in 1907 the McLaughlin Motor Car Co., Ltd., was formed with R. S. McLaughlin as president and G. W. McLaughlin as treasurer. Both are sons of the pioneer carriage builder, who was a director of the company. In 1915 the carriage business was sold and the Chevrolet Motor Co. of Canada was formed with G. W. McLaughlin as president and his brother as treasurer. This company became a unit of the General Motors of Canada in 1919.

# Willys Corp. Consents to Receivers

## Concurs in Petition to Conserve Assets

Purpose to Split Corporation into  
Parts—Willys-Overland  
Not Involved

(BULLETIN)

NEWARK, N. J., Dec. 1—Federal Judge Bodine late to-day removed C. O. Miniger and Frank P. Kennison of Toledo as receivers for the New Jersey property of the Willys Corp. He continued Clifford J. Voorhis, an attorney, appointed by him Monday to serve with the other two, and appointed James Kerney, publisher of the *Trenton Times*, in place of the ones removed.

Removal of Miniger and Kennison was demanded by attorneys claiming to represent 95 per cent of the bank and merchandise creditors. They contended that John N. Willys was attempting to dominate the receivership. Judge Bodine decided that both Miniger and Kennison had a direct personal interest in the affairs of the company and for that reason would be unable to serve impartially.

NEW YORK, Nov. 30—The Willys Corp., which has been more or less of a football for conflicting interests for months, has been placed under the protection of the courts in the hope that a reorganization and refinancing plan can be worked out which will be equitable for everyone concerned.

The Willys-Overland Co., which is an entirely separate corporation, is not involved in the receivership in any way, although 30 per cent of its stock is owned by the Willys Corp. Willys-Overland is in a stronger position than it has been at any time in two years.

### Hostile Action Averted

Court action which resulted in the simultaneous appointment of the same men as receivers by Federal judges in this city and Toledo, was taken last Saturday. It was based on a friendly proceeding undertaken by the Ohio Savings Bank of Toledo, which has a claim for \$100,000. The petition was filed with the knowledge and consent of the directors of the corporation through President John N. Willys. All the directors may be said to be representative of the Willys interest. They feel that under a receivership reorganization plans can go on without being subjected to the hostile in-

## OVERLAND BUSINESS GOOD, SAYS WILLYS

NEW YORK, Nov. 30—The following statement regarding the Willys-Overland Co. was made by President John N. Willys to-day:

"The current orders received at the factory last week were the largest in number and in dollars and cents for several weeks. Our retail sales reports show that the sales by our branches and dealers all over the country were the best last week for the last three weeks, although the week included a holiday.

"Particularly gratifying are the results already secured by our wholesale sales organization in signing up dealers for the new year. In only three weeks of effort, two-fifths of our dealer representation has been signed up and \$70,000,000 worth of cars for next year contracted for with shipping orders attached.

"Yes, business is good with Willys-Overland."

fluences of individual creditors and others.

One purpose of the receivership was to conserve the assets and avert hostile action by disgruntled creditors. Action became necessary when mechanics' liens aggregating \$500,000 were filed against the big new Chrysler plant at Elizabeth. It is understood that other creditors also contemplated drastic steps.

Committees representing bank and merchandise creditors, first and second preferred stockholders, have been struggling vainly for months to hit upon some plan of reorganization which would be mutually satisfactory. This task has been complicated by the provision in the first preferred stock that the consent of 75 per cent of the holders must be obtained before any lien can be placed on the assets of the company.

The corporation has been virtually in the hands of its creditors for months. The most powerful group has been that of the banks, headed by E. R. Tinker of the Chase National of New York. This committee has made no secret of its belief that a receivership was inevitable unless the preferred stockholders agreed to the issuance of some form of bonds or notes.

It had been understood that Kuhn, Loeb & Co. were about ready to loan \$15,000,000 with the Elizabeth plant as the main part of the security. Negotiations had progressed so far that it was

(Continued on page 1095)

## Start Conferences for Reorganization

Receivers Meet With Federal  
Judges Relative to Adminis-  
tration—Bond Fixed

NEW YORK, Nov. 30—Receivers Miniger and Kennison of the Willys Corp. arrived here Monday to confer with Federal Judges Knox and Bodine concerning the administration of the receivership. Their bond has been fixed at \$50,000 by the Ohio court. Guy W. Kinney, a Toledo attorney, has been appointed a special master to marshal claims against the corporation. Clifford J. Voorhis of New York has been appointed one of the ancillary receivers in this State to handle the affairs which may develop within the southern district of New York.

The receivers already have begun what probably will be a long series of conferences with the officers and directors of the corporation as well as the bank and merchandise creditors to determine upon a plan of reorganization which will be satisfactory to all the interests concerned and which it is hoped will place the finances of the company on a substantial foundation.

### Elizabeth Plant at Fault

The Auto-Lite Corp. and the New Process Gear Corp. have not been closed at any time since the depression began and each of them is understood to have returned a substantial profit. President Miniger announced only a few days ago that the Auto-Lite Corp. would increase its force to 2100 soon after the turn of the year. Approximately 1400 workers are now employed. It is probable there will be no change in the plan of closing the plant for inventory Dec. 17, but it is expected to be idle only a short time. There has been a very material improvement in the business of the corporation recently and a large volume of orders for future business has been booked. The Auto-Lite supplies several other companies as well as the Willys-Overland Co. with starting and lighting appliances. Its sales have more than doubled in the last 90 days.

The Elizabeth plant is the cause of all the difficulties of the corporation. It was built at a cost of \$8,000,000, and was expected to employ 8000 men. After buying the former Duesenberg factory, which was almost new, the Willys Corp. gave a contract to the American Concrete Steel Co. for the demolition of the Duesenberg plant and the building of the new factory. Much of the work was done on a cost plus basis during the

(Continued on page 1095)

# Action Is Independent of Bankers

## Tired of Bickering, Willys Acts Himself

### Failure of Conflicting Interests to Agree on Reorganization Real Reason

(Continued from page 1094)

stated only three weeks ago that production of the Chrysler "six" would begin in the near future. There evidently was an unexpected hitch in the negotiations, however.

The bank creditors' committee, headed by Tinker and representing a very powerful financial group, had no knowledge of the proposed receivership petition, and regarded it as a defiance of them by Willys. They were taken completely by surprise and vigorously protested to Judge Knox on Monday against appointment by him as receivers of C. O. Miniger, president of the Electric Auto-Lite Corp. as well as a vice-president of the Willys Corp., and Frank P. Kennison of the Ohio Savings Bank, who were named also by Judge Killets at Toledo. Judge Knox has reserved decision on this motion by the bankers, but he announced to-day the appointment of Col. Francis G. Caffey, former United States District Attorney, and entirely disinterested, as a third receiver.

The real cause of the receivership action, it is said, was to dissociate the paying properties from the burden of carrying the plant at Elizabeth which, because of the business depression, never began production and therefore has no assets.

Judge Bodine signed an order in Federal court at Newark, N. J., to-day, directing all those concerned in the receivership to show cause why the receivership should not be vacated. One of the allegations of the persons who object to the receivership is that the Willys Corp. loaned the Willys-Overland Co. \$6,000,000 with Willys-Overland stock as security.

An involuntary petition in bankruptcy, which is not regarded very seriously, was filed against the Willys Corp. yesterday by three small creditors with claims aggregating \$1,500.

The outcome of the receivership action, it is believed, will result in the sale of the Elizabeth plant, thus reducing materially the operating expenses of the Electric Auto-Lite Corp., the New Process Gear Co. and the United States Lighting & Heating Co., and the complete divorcement of each of the component parts will follow, allowing each to operate independently.

The unlimited development of the Electric Auto-Lite Corp., which is declared by those interested in the case to

be one of the most successful and most profitable plants of its kind in the United States, is assured under the receivership. Even now, in the face of business readjustment, it is being operated at a large profit.

### Appeals to Stockholders

The following statement in reference to the receivership was made by Willys:

"The receivership proceedings brought against the Willys Corp. at Toledo should be regarded by all classes of creditors and stockholders as protective of their interests. It is, of course, much to be regretted that a receivership should be deemed necessary at all. These proceedings against the Willys Corp. do not affect the Willys-Overland Co. in any way. The Willys-Overland Co. is one of the best known automobile companies in the country and its position is sound. Its business is satisfactory under the conditions of to-day and is showing constant improvement."

"In view of the inability of the protective committee representing the creditors and stockholders of the Willys Corp. to get together on a plan of reorganization satisfactory to all, and on account of daily increasing danger of hostile action by individual creditors or others, the board of directors has deemed it best not to oppose the application of the Ohio Savings Bank & Trust Co. for a receiver. A plan of reorganization which will be fair to everybody can now be worked out under the protection of the court."

"The embarrassment of the Willys Corp. came about when it was overtaken by the business depression a year ago with its new automobile plant at Elizabeth, N. J., in an unfinished condition. I feel confident that in the remaining large value of its assets and in the proven power of its operating units it has resources with which, if given reasonable time, the corporation can take care of all its creditors and preserve substantial equities for all classes of stockholders. I particularly urge the stockholders not to sacrifice their investments, but to have patience and hold on while the situation is being worked out. The return of normal business conditions will see a great improvement in the condition of the corporation."

## Conferences Started for Reorganization

(Continued from page 1094)

war when wages and material costs were at their peak. Machinery has been installed and it was reported only a fortnight ago that production of the Chrysler Six would be started in the near future. The company had intended to bring out this car more than a year ago, but the plan was frowned upon by bankers who were heavy creditors, on the ground that the time was inauspicious. The car has been thoroughly tested and while no details concerning it have been made public, it is said to have been entirely satisfactory. This development work has cost more than \$1,500,000.

(Continued on page 1096)

## Overland Exports Doubled in Quarter

### Increase May Reach 175 Per Cent —December Anticipated as Record Month

TOLEDO, Nov. 28—The last quarter of this year will see a total increase of between 100 and 175 per cent in the export sales of Willys-Overland cars, officials of the John N. Willys Export Corp., now located here, believe. They base their figures on the results obtained in October and the large increase of overseas business in November. December is looked forward to as a record month for that field.

Figures at the close of the year will show that about 60 per cent of foreign business has been done in the last three months of the year.

Better international trade relations are noticeable and it is believed that this is due in no small measure to the efforts toward limitation of armaments now going forward at Washington.

"The revival of business throughout the world will not come with a rush," said John N. Willys, president of Willys-Overland, "but it may be counted upon that any reduction in armament means that more money will be released for trade. I feel sure that a successful conference at Washington will bring to Willys-Overland a wonderful increase in export trade."

### Domestic Trade Improves

Most of the recent orders have come from England, Australia, Brazil, Belgium, the West Indies and India. Most other countries showed increase in demand for automobiles.

The domestic distribution is also picking up. The company has the largest number of unfilled orders on its books for enclosed models in its history, and the 1922 orders booked for Willys-Knights show that production in these models will exceed the combined total for 1920 and 1921.

Willys announced that orders on hand will call for production of 150,000 cars next year and mean employment of 12,000 men in the plant here.

## Price of Ford Tractor Reduced \$87.50 in Peru

LIMA, PERU Oct. 31 (By Mail)—The outstanding automotive event of the month just closing is the reduction in the price of the Fordson tractor from £325 to £300. This reduction at the present rate of exchange is roughly \$87.50 in American gold. The reduction may be followed by similar decreases in various makes of automobiles, trucks and tractors.

## Willys Receivers Start Conferences

### Corporation's Attorney Appears Before Court and Consents to Receivership

(Continued from page 1095)

The complaint in the proceedings here was filed by Charles A. Frueauff of Frueauff, Robinson & Sloan, 67 Wall Street, attorneys for the plaintiff. The complaint sets forth that the Ohio Savings Bank & Trust Co. holds a 90-day note of the Willys Corp. for \$150,000, dated Oct. 12, 1920, on which the bank claims \$100,213.90 is due and payable with 6 per cent interest since Jan. 10.

#### Indebtedness \$10,000,000

The complaint puts the aggregate indebtedness at not less than \$10,000,000 and not in excess of \$14,000,000. On account of the present general financial depression and particularly by reason of the condition of the automobile industry, the plaintiff says, the defendant is unable to operate its factories except to a limited extent, there being no outlet for the entire production capacity, and that the defendant having on hand a large inventory of raw, partly manufactured and finished product, has not sufficient cash to meet its liabilities as they mature, although the fair value of the assets is greatly in excess of the total amount of liabilities.

The complaint asked that the same receivers appointed for the property in Ohio be appointed here, and that they be authorized to continue the operation of the company's plants and business at the orders of the court. It also asked that, pending the suit, the officers, employees, stockholders and creditors of the company be restrained and enjoined from interfering with the management.

#### Includes Various Interests

The Willys Corp. was organized in August, 1919, under the laws of the State of Delaware. It was formerly known as the Electric Auto-Lite Corp., and in addition to its own plants acquired the business of the New Process Gear Corp. of Syracuse and the Duesenberg Motors Corp. of Elizabeth, N. J.

The corporation also owns practically all the stock of the United States Light & Heat Corp. of Niagara Falls, which manufactures U.S.L. batteries. Miniger is president and general manager of this company as well as Auto-Lite. In addition, the corporation owns a large block of the capital stock of the Fisk Rubber Co.

Estimated balance sheet, as of March 1, 1921, showed total assets of about \$18,500,000. Of this approximately \$23,000,000 was considered current, and included \$11,064,000 securities of other companies. Among these securities were \$1,000,000 par value Fisk Rubber common stock, \$1,000,000 par value Federal Rubber preferred stock, and approximately 730,000 shares of Willys-Overland common carried at \$8 a share. At current prices, around \$5 a share, the shrinkage in

value of Willys-Overland holdings approximates \$2,000,000. Other current assets included \$7,220,000 inventories, and \$3,800,000 notes and accounts receivable. Property account aggregating \$16,000,000 showed the Elizabeth project carried at \$10,214,000, Syracuse plant at \$2,640,000, and Toledo works at \$3,213,000. Good will and patents were valued at \$890,000.

Current liabilities totaled \$14,432,000. They comprised \$11,235,000 notes payable; \$1,362,000 accounts payable; \$1,456,000 acceptances payable and \$379,000 of miscellaneous current liabilities.

Officers of the corporation are J. N. Willys, president; W. P. Chrysler, J. R. Harbeck, J. A. Smith and C. O. Miniger, vice-presidents, and E. P. Decker, treasurer. The directors include J. N. Willys, J. R. Harbeck, C. O. Miniger, J. E. Kepperley, C. B. Mertz, S. A. Strom and W. P. Chrysler.

Several protective committees were formed months ago to look after the various interests in the corporation. C. B. Page of Brooklyn heads a merchandise creditors' committee; E. R. Tinker of the Chase National Bank is chairman of the bankers' committee; Howard Bayne heads a first preferred stockholders' protective committee, and Arthur O. Choate a second preferred stockholders' protective committee.

### Crossley Motors, Ltd., to Produce Bugatti

LONDON, Nov. 22 (By Mail)—The recent report that Willys-Overland-Crossley, Ltd., had taken over the manufacturing rights for the Bugatti cars in Great Britain was based upon misapprehension. The manufacturing rights for the Italian car have been obtained by Crossley Motors, Ltd., of Manchester. It is understood the two present Crossley models will be continued and that the Bugatti four merely will be added to the line. The English price of the small car, which it is hoped will satisfy the demand for a small car above the average, will be considerably below that of the imported Bugatti.

### Shipments Will Exceed Those of November, 1920

NEW YORK, Dec. 1—Preliminary reports received by the National Automobile Chamber of Commerce indicate that shipments of passenger cars and trucks for November will materially exceed those of November last year but will show a seasonal falling off as compared with last month. The showing is considered gratifying because November is the first month of the year to show a gain as compared to the same period in 1920.

#### WESTCOTT BUSINESS HOLDS UP

SPRINGFIELD, OHIO, Nov. 28—"Business is holding up fairly well," General Manager H. G. Root of the Westcott Motor Car Co. states concerning November trade. "November was equal to October and it was an average month."

## Say Parts Contracts Are Still Violated

### Manufacturers Complain That Many Car Makers Assume Indifferent Attitude

(Continued from page 1087)

manufacturer that he must abide by same. The world has condemned the term 'mere scrap of paper' but unfortunately many are applying that principle to their business policies."

There is a growing feeling also that the time is coming when drastic action should be taken against the comparatively few companies which have failed after many months to reduce their obligations, either in the form of commitments or past-due paper. Some material suppliers take the position that if these companies have been unable up to this time to meet their obligations they never will be able to do so.

#### Keener Competition Expected

The fear also is growing that in the numerous reorganizations contemplated by companies in financial difficulties, some of them will make an effort to "freeze out" merchandise creditors notwithstanding their disposition at all times since the depression began to follow a constructive policy.

The thoughts of parts makers as a whole in regard to the problems of the industry at this time are running along virtually identical channels. The general belief is that the volume of automobile sales in 1922 will not greatly exceed that of 1921, although there probably will be some improvement, particularly in the truck field, because of better general business conditions. The result will be much keener competition for their business.

#### Service Grows in Importance

There also is a feeling that parts manufacturers should profit by their experience of the past 18 months and select their customers carefully instead of letting customers select them. Automobile concerns which are not amply financed and in a position to fight hard for their share of business by giving purchasers good value, are likely to fall by the wayside.

Parts makers expect the coming year, beginning with the New York and Chicago shows, to develop a trend toward lighter, lower priced cars, with a return to pre-war quality and greater fuel economy, to sell at the lowest possible price consistent with a profit based on efficiency and economy of operation.

#### FORD TO HELP UNEMPLOYED

DETROIT, Nov. 28.—Thousands of idle building trades workers in the city will be given employment this winter through the plans of the Ford Motor Co. for extensions and building improvements. Edsel B. Ford, president of the company, made such a statement to Mayor Couzen's unemployment conference.

## Distribution Costs Sought in Inquiry

### Congressional Committee to Obtain Data on Transportation Facilities

WASHINGTON, Nov. 29 — Investigation into costs of distribution by motor trucks and cars will be undertaken immediately by the Joint Commission of Agricultural Inquiry of Congress. Chairman Sidney Anderson to-day announced that a committee, representing these shippers, would be appointed at an early date as one of the 44 committees of shippers named in conjunction with the executive traffic committee of railroads for the purpose of obtaining data on marketing and transportation facilities. These groups represent 95 per cent of total tonnage of land and water carriers.

In addition to inquiry into motor haulage costs, the commission wants information as to comparative freight charges from electric and water carriers. These committees have been asked to report by Jan. 1, when their work will be reviewed and analyzed by an advisory committee of 12 members. F. E. Todd, vice-president of Deere & Co., Moline, Ill., represents the agricultural implement industry.

Undoubtedly, if the commission adheres to its present policy the inquiry into motor haulage will involve costs of trucks under pre-war, war and post-bellum conditions, costs of repairs and average earnings of fleet operators, as well as individual owners.

The commission explained its attitude, as follows:

"Every phase of distribution is being investigated in relation to transportation. This investigation involves physical property, transportation service, the economic relation of transportation to agriculture, and industry, and the administration of transportation to the analysis of State and Federal laws, applying to transportation.

"A study is being made of the relation of car service and supply and the successful distribution of products, with particular reference to the condition of equipment. It can be conservatively stated that 15 per cent of the equipment of the railroads is in poor condition."

#### Believes Changes Necessary

The purpose of this inquiry, which was authorized by a special act of Congress last spring, is to apply four standard tests in an effort to measure the condition of agriculture, as compared with other industries. The inquiry will reach the purchasing power of the farmers' dollar; the absolute price of agricultural products as compared with prices of other commodities; quantity production of agriculture, as compared with quantity products of other industries; and the rewards for capital invested and labor employed in agriculture, as compared with the rewards for capital invested and labor employed in other industries.

## CONDITIONS ADVANCE STEADILY TO NORMAL

WASHINGTON, Nov. 30 — Encouraging indications of progress toward normal conditions in November are noted by the Federal Reserve Board in its review of the business and financial situation. The board says:

"The general situation of trade and industry is unmistakably more hopeful and is improving as steadily as can be expected in view of the slowness of economic progress in other parts of the world, particularly in western Europe. Another handicap to complete readjustment continues to be the failure to bring about a proper co-ordination and mutual relationship of prices.

"This is responsible for no small part of the slowness of economic recovery in certain branches of business. On the whole, the best opinion now looks to the steady, even if locally interrupted, progress back to normal conditions although no immediate or sudden expansion or boom is now in sight."

It is significant to note that the commission has found that little evidence of unreasonable breadth exists between producers' and consumers' prices. In a statement to-day, Chairman Anderson said:

"The costs of distribution were increased slowly but steadily prior to 1913. So far as we can ascertain, they have about doubled since 1913, and to-day the costs of distribution represent about one-half of prices which the final consumer pays. These increases in costs do not occur in any one place in the line of distribution. They occur as a part of the price of every element of service performed in connection with the distribution of the product, all along the line.

"This means that the spread between the producers' and consumers' prices must, for the most part, be reduced by more efficient methods of distribution; by reducing unnecessary transportation hauls; by more efficient merchandising methods; by more closely relating output to market; by speeding up turnover; by reducing unnecessary stocks, and otherwise shortening and speeding up the steps between the producer and the consumer."

#### OFFER MADE FOR PARTS PLANT

CLEVELAND, Nov. 30—The receivers of the Standard Parts Co. have received an offer of \$300,000 for the Canton, Ohio, forging plant which it was decided some time ago to place on the market. The offer is understood to have been made by Chicago interests. It will come before the Federal Court in a few days.

#### E.-B. TO SELL PLANT

WAYNESBORO, PA., Nov. 30—Plans of the Emerson-Brantingham Co. for the sale to a new \$1,000,000 company of its plant here are said to be maturing.

## METAL MARKETS

**A**UTOMOTIVE consumers are beginning to display sufficient interest in covering their steel requirements for the first quarter of 1922 to engender a steadily growing attitude of reserve on the part of producers. Beneath the surface of this jockeying of buyers and sellers for a position which later developments will bear out to have been correct, there prevails, however, considerable uneasiness on the part of producers lest too stiff a posture result in the loss of urgently needed business to more eager competitors.

Especially in the sheet market is there evidence of efforts to lift selling prices to higher levels. Undismayed by the failure which attended recent attempts to advance sheet prices, some of the leading sheet rollers seem to have concluded that what was impossible a few weeks ago will be easy of accomplishment, now that the seasonable moment for broadened demand is about to come. That the argument of prevailing market levels being lower than cost of production should once more be trotted out in support of this movement is only natural.

In the case of some mills it is undoubtedly true that the margin of profit at present sheet prices is a precarious one, but there has been ample evidence in the last year that the steam roller of economic readjustment is no respecter of the difficulties which some mills experience in paring their costs. That there should be in the steel industry, like in all others, those who believe that 1922 will be so much more prosperous a year than 1921 that they are reluctant to commit themselves on the basis of prevailing prices is a psychological condition little to be wondered at.

The nearer, however, draws the date on which we will write 1922 instead of 1921 the more forcibly is brought home the fact that a mere change of the calendar year will not bring a change in fundamental conditions and that the steel market of the first quarter of 1922 will fall heir to the ills that now beset it, at least, to most of them. Gratifying improvement continues to be maintained in the rate of steel mill operations over the 1921 low point and sane optimists in the trade are confident of further progress in the direction of normal peace-time activity. Whether such progress can be translated with impunity at this time into higher market levels is, however, a moot point not only between consumers and producers but also between the more conservative and advantageously situated producers and those whose lack of productive and financial facilities compels their seeking solace in the hope of rising prices. That the latter are pinning their faith on a quagmire is obvious.

**Pig Iron.**—Automotive foundries are sounding the market, but tonnages involved in contracts placed are light, consumers still being in a hesitant mood.

**Steel.**—Somewhat improved demand for steel bars comes from tractor manufacturers. There is still talk of 1.50c., Pittsburgh, for soft bars and 2.00c. for cold-drawn, but most of the business is for small lots carrying slightly higher prices. Strip steel demand has tapered off, but some automotive interests who have contracts at 2.00c. for the hot-rolled and at 3.75c. for the cold-rolled are specifying more freely. The sheet market is floundering.

**Aluminum.**—Small lots of imported metal are again changing hands at considerably below 18c., but the market for representative import business holds firm.

## INDUSTRIAL NOTES

**Super-Traction Truck Co.** of Fox Lake, Wis., incorporated a year ago with \$300,000 capital to build six-wheeled motor trucks, is negotiating with the new industries bureau of the Association of Commerce of Fond du Lac, Wis., with a view of establishing the permanent factory and offices in that city. The company is now operating a small shop at Fox Lake and has been effecting a limited production. A feature of the truck is the patented device by which the dual set of rear wheels is coupled.

**Mutual Truck Co.'s** plant and equipment at Sullivan, Ind., will be offered at public sale by the receiver Dec. 22. The sale will include 12 acres of land with siding to the C. & E. I. and Illinois Central railroads; a large modern brick building with steel truss roof; heating plant, machine tools, drawings, blue prints and a miscellaneous stock of materials and parts for building a 2½-ton motor truck. The First National Bank, Sullivan, is the receiver and E. D. Maple the trust officer in charge.

**Fort Smith Body Co.**, Fort Smith, Ark., with a capitalization of \$100,000, has been formed to take over and operate the Johnston Commercial Body Co. plant in that city. Incorporators are Ben Johnston, president; I. H. Nakdimen, secretary and treasurer, and J. B. McDonough. The plant manufactures truck bodies for all makes of automobiles. The company was purchased recently by I. H. Nakdimen at a sale of the assets.

**Deere & Co.**, Moline, Ill., has added small crews to its present working force, establishing a three-day-a-week shift, giving favor to old employees. The new force, it was said, is to handle some immediate work without indication that the company will return to a large production schedule.

**Hubbard Pressed Steel Co.**, Youngstown, Ohio, has obtained a contract from Durant Motors for all general stamping for its four-cylinder and six-cylinder cars. The contract involves \$500,000 and will require several thousand tons of light steel plate, blue annealed sheets and strip steel.

**Kalamazoo Tire & Rubber Co.**, established recently by L. W. Coppock, production manager for the Kalamazoo Motors Corp., is working on a production schedule of 1000 tires a month. The small force now employed will be increased early next year.

**Gold Seal Battery Co.**, Green Bay, Wis., has made permanent its informal organization of six months ago by incorporation with an authorized capitalization of \$100,000. A plant has been established and is now in production on storage batteries.

**Lance Mfg. Co.**, New York City, has opened a Pacific coast branch in San Francisco, where a warehouse has also been established. All shipments of goods for points west of the Rocky Mountains will be made from that branch.

**Kelly-Springfield Motor Truck Co.** has added to its force at the Springfield, Ohio, plant, due to increased orders. Orders received recently have been mainly from the large cities, especially from the eastern section of the country.

**Dayton Rubber Mfg. Co.**, Dayton, Ohio, reports that its 1921 business will amount to more than twice the volume transacted in 1920 and anticipates an increase next year.

**Anderson Electric & Equipment Co.**, Chicago, is now controlled by A. I. Appleton of the Appleton Electric Co., Chicago, who purchased B. J. and O. E. Grigsby's stock in it.

Lovejoy Mfg. Co. announces its removal from 1040 Commonwealth avenue to 39 Brighton avenue, Boston.

## BANK CREDITS

*Written exclusively for AUTOMOTIVE INDUSTRIES by the Guaranty Trust Co., second largest bank in America.*

While the trend of call money during the past week has been irregular, time money has shown an undertone of greater ease. Funds appeared to be abundant and a fairly good turnover of business was reported. Call money ranged from 4½ per cent to 5½ per cent as compared with 4 per cent to 4½ per cent in the previous week. The rate for all fixed-date maturities from 60 days to 6 months remained unchanged at 5 per cent to 5½ per cent. Prime commercial paper was again quoted at 5 per cent to 5½ per cent.

The Federal Reserve statement as of Nov. 23, 1921, showed a further increase in the total reserve ratio from 71.8 per cent to 72.3 per cent. The net gain in total reserves was \$8,760,000 as a result of an increase of \$11,328,000 in gold reserves and a decrease of \$2,568,000 in other cash reserves. Total bills on hand increased \$8,218,000, while Pittman certificates decreased \$1,500,000. United States bonds and notes increased \$359,000, while other bonds and notes decreased \$13,428,000. As a result of the foregoing changes, total earning assets showed a contraction of \$6,351,000. There was also a decline of \$8,308,000 in the amount of Federal Reserve notes in circulation.

The total gold reserves of the New York institution increased \$2,028,000 during the week. Total earning assets increased \$19,178,000 and Federal Reserve notes in circulation \$2,956,000.

During the past week the bond market was characterized by further activity and strength. A large number of transactions was reported and in many cases quotations closely approximated or exceeded previous high records. It was the experience of several investment houses that the demand for high grade bonds exceeded the supply available. On Nov. 22 an issue of 4½ per cent highway bonds of the State of Pennsylvania was sold to a syndicate of New York bankers at 104.31, this price representing a new high for the year for securities of this class.

The publication last week of price indices reflects a slight downward trend of commodity prices after a short period of relative stability.

## VICTOR PRICES REVISED

**SPRINGFIELD, OHIO, Nov. 28**—The Victor Rubber Co. has reduced its prices on cord tires 30 per cent and on fabric 22 per cent. Prices have been reduced from 3 to 10 per cent on tubes.

## DORRIS INCREASES PRICES

**ST. LOUIS, Nov. 28**—The Dorris Motor Car Co. has increased the price of its seven-passenger sedan from \$6,690 to \$7,190, effective immediately.

Truck Possibilities  
Noted in Argentina

## Foreign Manufacturers Are Already Advertising Products and Pushing Sales

**WASHINGTON, Nov. 30**—While there are at present probably not more than 2000 motor trucks in Argentina, of which 1023 are registered in Buenos Aires, as soon as business conditions begin to improve that country will offer a field with great possibilities for the sale of motor trucks of all sizes from the light delivery cars to the heaviest trucks for long hauls with heavy burdens, says a report made to the Bureau of Foreign and Domestic Commerce by Trade Commissioner George S. Brady, Buenos Aires.

## Wide Field for Use

Trucks of from 3 to 7½ tons capacity especially should find an extensive sale in the vast pampas country for hauling the grains and wool to the stations, and in the Andean foothills for hauling mica, manganese, tungsten ore, and other exportable minerals to the railroads. American passenger automobiles now almost monopolize the Argentine market, and the same will be true of the Argentine motor truck market if the American manufacturers will put forward sufficient effort at this stage, it is stated.

## The report continues:

"The present price advantage of European truck manufacturers due to exchange, and the general depressed tendency of the market has caused some American manufacturers to withdraw from the field while others have stopped their advertising and restricted their activities. This is allowing the European trucks to gain an advantage at a critical time when the public mind is actually being formed to accept truck transportation. English, German, and French trucks are being advertised and pushed at the present time. American manufacturers should make every effort to keep their trucks before the Argentine public and be content with small sales and small profits for a time in order to get a few of their trucks in the service of this country.

## Prices of Foreign Products

"With a well planned start the resulting sales in the next few years will well repay the effort as the coming market for motor trucks in Argentina will undoubtedly be very large. The present price competition to be met with by European trucks in Argentina can be judged by the following prices of European cars in Buenos Aires. To this price the American manufacturer should add freight charges and a duty of 32 per cent. The peso may be taken as equivalent to 31 cents United States currency.

## MEN OF THE INDUSTRY

Arthur C. Brauer, for the past four years assistant chief engineer and chief inspector of the Saxon Motor Car Corp., has been promoted to factory manager in charge of production, engineering and inspection. Brauer has been connected with the industry in engineering and production work since 1907, having been with the Thomas Motor Co., Ford Motor Co. and Studebaker Corp.

Gaylord A. Hoyt has been appointed assistant sales manager of the H. H. Franklin Mfg. Co., Syracuse, succeeding Ernest P. Johnson, who has resigned. Hoyt has been with the organization since the first of the year and has acted as a district manager with unassigned territory. Since April 1 he has been calling on Pacific Coast dealers.

Robert F. Brown has been appointed treasurer of the Dayton Rubber Mfg. Co., Dayton, Ohio. He has been actively engaged in the financial field for sixteen years and most recently was connected with Well, Farrel & Co., Boston, as manager of its New York branch.

E. P. Weber, former general sales manager of the Bergougnan Rubber Corp. of Trenton, N. J., has resigned from that organization, effective Jan. 12. This action is taken in anticipation of his entrance into the manufacturing tire field.

Paul Runyan has resigned as advertising manager of the Westcott Motor Car Co. and opened an insurance office in Springfield, Ohio. He is succeeded by Karl A. Heinzen, who has been acting as publicity man for the company.

Charles Addams, formerly a sales engineer with the Standard Roller Bearing Co. of Philadelphia, has become associated with the Bearings Co. of America as sales engineer in the Eastern territory.

R. R. Zimmer, formerly chief engineer of the Dupont Motors, is now connected with the Lawrance Aero-Engine Corp., as engineer, in charge of the engineering department.

Morgan Douglas, formerly manager of the Portland, Ore., Chevrolet retail branch has been appointed assistant to the zone sales manager at the Chevrolet factory in Flint.

Alfred Reeves, general manager of the National Automobile Chamber of Commerce, will address the Dealers Association at Washington, D. C., Friday night, Dec. 2.

L. H. Earle, eastern sales manager, engine division, for the Buda Co., has moved his office from 1216 Aeolian Hall to 30 Church Street, New York City.

Wm. B. Hoyle has been appointed manager of Cole Motors, Inc., of California.

Wayne Company Purchases  
Water Softening Business

FORT WAYNE, IND., Nov. 30—The Wayne Oil Tank & Pump Co. of this city has bought the Borromite Co. of America, Chicago, for the sum of \$500,000 and has also acquired the Warriner Mfg. Co. of Fort Wayne, which is putting on the market an apparatus for softening water. The Borromite company is also a manufacturer of water softening and purifying apparatus.

As soon as possible the machinery and equipment of the Chicago company will be moved to this city. Additional fac-

tory buildings will be erected on the company's seventeen acre site and the work of manufacturing the apparatus will be pushed with all possible speed.

In addition to securing the factory and business of the Chicago concern the purchase also gives to the Wayne oil company the control of zeolite mines in New Jersey. Homer G. Tate, president of the Borromite company, will join the Wayne oil company to assume charge of the water purifying apparatus here.

## FINANCIAL NOTES

Pierce-Arrow will probably show a small profit in the current quarter with profit and loss surplus, which at the close of last year was \$4,500,000, likely to be less than \$500,000. The improvement is due to the betterment of the inventory situation, which aggregates \$14,000,000, compared with \$16,500,000 on Jan. 1, to the absorbing of the cost of the new line and to a reduction in the overhead. It is not probable that there will be an appreciable reduction in bank loans, which now total about \$7,000,000. Business is considerably better than was to be expected at this time of the year with passenger car sales in fairly good volume and truck trade holding up.

Erie Tire & Rubber Co. receiver has asked the court for authority to collect \$278,404 unpaid subscriptions for preferred stock and to obtain payment for \$1,029,986 common stock, chiefly issued as bonus to preferred purchasers. This action has been recommended by the creditors' committee, consisting of F. B. Peterson, David Kuble, H. H. Whitman and Z. P. Zollinger.

Gaeder Paeschke & Frey Co., Milwaukee, manufacturer of steel stampings, sheet metal goods, enameled utensils and other ware and also the exclusive maker of the Maxim silencer, has increased its authorized capitalization from \$1,000,000 to \$2,000,000 for the general accommodation of the growth of its plant and business.

Kelley Tire & Rubber Co.'s plan calling for a survey of the company's property with a view to reorganization, as advanced by the stockholders' protective committee, has been approved by Judge Keeler in New Haven.

Earl Motors, Inc., directors have authorized the issuance of 200,000 additional shares (no par) to stockholders of record Nov. 22, 1921, at \$10 a share to the extent of 100 per cent of holdings. The offering expires Dec. 2.

Ford Motor Co. of Canada has 1200 stockholders, mostly Canadians. Of the stock 18 per cent is owned by Henry Ford. The company has exclusive manufacturing and selling rights for Ford cars in Canada.

Advance-Rumely Co. has declared the regular quarterly dividend of 75 cents a share on the preferred stock, payable Jan. 3 to stock of record Dec. 15.

Franklin Automobile Co., Syracuse, announces that from Jan. 1 to Nov. 1 it has sold direct to the public capital stock to the amount of \$2,515,700.

## HARVESTER REOPENS FOUNDRY

SPRINGFIELD, OHIO, Nov. 29—Owing to the booking of good sized orders for motor trucks and castings, the Springfield works of the International Harvester Co. has opened its foundry and will operate it all winter.

G. M. Export Trade  
Improves Steadily

## October Best in Year with November Probably Exceeding That Month

NEW YORK, Nov. 30—Current orders received during October by the General Motors Export Co., covering all the lines of passenger cars, were in excess of those received during any month since October, 1920. November orders are continuing this improvement or exceeding it. The present business is chiefly on the Buick and Chevrolet lines and comes principally from Australia, although other countries of Latin-America and elsewhere are numbered among the purchasers.

The general impression among exporters here is that the export market again is on the upgrade and the announcement to-day by General Motors shows to what an extent this trade has bettered. Heavy shipments of cars during the last months of 1920 and the early months of 1921, it is explained, were made on old orders that were not filled during the earlier rush of domestic sales, and the fact that the orders now being received are at such volume shows definitely that the export markets will take an appreciable percentage of the American production.

General Motors, it is stated, has not yet begun any general foreign sales on the new Buick four, further than to supply a few of its older dealers with demonstration cars. Shipments of this line are expected to begin early in 1922, export sales on the Buick being confined until that time to the six-cylinder models.

Hearne Wins Los Angeles  
Race, Making No Stops

LOS ANGELES, Nov. 30—From the mechanical end the Thanksgiving Day race on the Beverly Hills Speedway showed practically no developments. Six of the cars had Duesenberg power plants, four Frontenac and two Miller, the latter built in Los Angeles. Hearne, the winner, who covered the 250 miles at an average of 109.7 m.p.h., drove one of the eight-in-line Duesenbergs. He had absolutely no troubles of any kind going through the entire contest without a stop.

Several of the cars had to replenish their water supply, which is unusual in such races.

## ORDERS NEW OWEN SALE

WILMINGTON, DEL., Nov. 28—Federal Judge Morris has set aside the sale of the personal property of the Owen Magnetic Motor Car Co. and has ordered a new sale on the ground that the original order of the court was not complied with and that the price was inadequate.

# Calendar

## SHOWS

Nov. 27-Dec. 3—New York, Automobile Salon, Hotel Commodore.  
Jan. 7-13—New York, National Automobile Show, Grand Central Palace, Auspices of N.A.C.C.  
Jan. 9-14—New York, Motor Car Body Exposition, Automobile Body Builders Association, Twelfth Regiment Armory.  
Jan. 28-Feb. 4—Chicago, Automobile Salon, Hotel Drake.  
Jan. 28-Feb. 4—Chicago, National Automobile Show, Coliseum, Auspices of N.A.C.C.  
Feb. 6 to 11—Seventh National Tractor Show and Educational Exposition, Minnesota State Fair Grounds, Minneapolis.

Feb. 6 to 11—Winnipeg, Can., Automotive Equipment Show, Western Canadian Automotive Association.

## FOREIGN SHOWS

Nov. 26-Dec. 3—Shanghai, China, Automobile Show.  
Nov. 28-Dec. 3—London, Motorcycle Show.  
Dec. 3-14—Brussels, Belgian International Automobile Show.  
March, 1922—Santiago, Chili, Annual Automobile Show.  
May, 1922—Quito, Ecuador, Agricultural Exposition, celebrating Centenary of Ecuador, Automotive Section.  
Sept. 1922—Rio de Janeiro, Brazil, Automobile exhibits in connection with the Brazilian Centenary Asocioao Automobilista Brasileira.

## CONVENTIONS

Dec. 6-8—Chicago, Second Annual Meeting of American Petroleum Institute.  
Dec. 10—New York, American Institute of Mining and Metallurgical Engineers.  
Dec. 20—Philadelphia, American Society of Mechanical Engineers.  
Dec. 27-29—Chicago, American Society of Agricultural Engineers, Auditorium Hotel.  
Jan. 17-20, 1922—Chicago, American Road Builders Association.  
Jan. 30-31—Chicago, Fifth Annual Convention, N. A. D. A., La Salle Hotel.

Chicago, Feb. 1

Minneapolis, Feb. 8-9—Annual Tractor Meeting.

## Ford Maintaining Output Schedule

### Maxwell Expanding Production Program—Hupp Building Fifty Cars Daily

DETROIT, Nov. 30—Shipments of the Ford Motor Co. for November will approximate the 75,000 vehicles for which the schedule called at the beginning of the month. Business in December is expected to reach about the same proportions. There is a steady demand from practically all branches, but manufacturing at the Highland Park plant will be on a somewhat smaller scale than in recent months, although it is declared there will be no shut down before the inventory period which begins Dec. 25.

Production of the new Maxwell models is being increased steadily to fill the orders which are coming to the factory from all parts of the country. Output is being expanded slowly so that the high mechanical standard will not suffer. Production of the new car has been averaging higher than 100 cars a day.

The plant of the Hupp Motor Car Corp. is running on a basis of 50 a day and will build 1300 cars in November. A steady business is looked for in December and the factory will not close for inventory as this was taken late in the summer. The American Gear Mfg. Co., a subsidiary of Hupp at Jackson, Mich., has resumed work with 350 men after a six weeks' shut-down.

## Georgia Business Varies with Size of Counties

ATLANTA, Nov. 28—An interesting feature is noted in an analysis of automobile sales in Georgia for the first eleven months of 1921, according to the number of licenses issued by the Secretary of State, in that every large county in Georgia shows an increase in the number of sales as compared with the first eleven months of 1920, while every small county shows a decrease.

The larger counties include those in which are located such cities as Macon, Savannah, Augusta, Columbus, Rome and Atlanta. The total increase in these larger counties is well over 5000, the increase in Fulton County alone, in which Atlanta is located, being almost 4000 to date. Total registration for the whole State, however, is less than the same period in 1920.

With the exception of Fords, sales in the Atlanta territory during November have declined slightly as compared with October.

## Used Car Sales Increase in Texas Over October

DALLAS, TEX., Nov. 28—With the exception of used cars, there appeared to be a decrease in the automobile business in Dallas and practically all Texas for the first half of November when compared with the first half of the preceding month. In actual retail sales reported in Dallas this decrease was about 10 per cent. The wholesale trade was about on the same basis.

But for used cars there was an increase in business of 40 per cent over the used car business of the first half of October. This probably made the number of cars actually sold at retail equal to the number sold during the first half of October.

Generally, dealers do not expect business to decrease materially during the remainder of the year.

## REVENUE FROM INDUSTRY LESS

WASHINGTON, Nov. 28—Slackened production in the automobile industry during the latter part of 1920 and the early months of 1921 is reflected in the annual report of the Bureau of Internal Revenue, showing that excise taxes from that source fell off \$38,538,121.72 as compared with the previous year. A decrease of \$812,579,486.07, or 15 per cent in the total of excise taxes is reported for the fiscal year ended June 30, 1921, as compared with 1920. The income and profits tax collections declined \$728,798,329.85.

## Reimportation Duty Opposition Lessens

### Senate Expected to Adopt Resolution Adding Tax to War Material

WASHINGTON, Dec. 1—With the convening of the regular session of the 67th Congress Monday, the National Automobile Dealers Association and other organizations are hopeful that the Graham resolution, which would impose a special duty of 90 per cent on surplus war material reimported into this country, will be passed in the Senate. Reports have been received showing that groups of American speculators have been rushing automobile trucks and other motor equipment into American ports in efforts to avoid these heavy assessments.

Senators who objected to this resolution when it was reported favorably from the Senate Finance Committee have been advised of the situation and as a consequence have indicated that they will not oppose the resolution. It is becoming increasingly apparent that this protection must be accorded the American automotive industry now.

## Detroit Steam Motors Will Make \$1,000 Car

DETROIT, Dec. 1—The Detroit Steam Motor Corp. has been incorporated in this State to manufacture a steam automobile in this city. The car will follow the best practices in steam car experience up to this time with several refinements in mechanical features and design.

O. C. Trask will be president and treasurer of the company. He is a member of the firm of Trask, Kennedy & Co., Michigan distributor of the Stanley steam car. The new car will sell in the \$1,000 class. It will weigh between 1500 and 2000 pounds, will have a 110-in. wheelbase and will be built in four body styles. The first showing will be at the Detroit show.

*Ignition, Starting and Lighting*

**M**ANUFACTURERS feel keenly their personal responsibility for the individual units comprising their standard equipment.

Foremost in importance is ignition, starting and lighting.

Atwater Kent products enjoy the confidence of a large number of prominent manufacturers. This equipment meets the most exacting requirements from the standpoint of design, quality of workmanship and performance.

ATWATER KENT MFG. COMPANY

*Philadelphia*

**T**HE outstanding factor in automotive progress has been **SPECIALIZATION**—**SPECIALIZATION** to the extent that entire organizations have concentrated all their efforts upon producing and perfecting a single part.

And it has been this concentration of skill upon individual units that has made possible **SPECIALIZED** cars—cars that unit by unit afford the motor buying public the supreme achievements of engineering and manufacturing specialists.

It is not unusual, therefore, that farsighted dealers and distributors, in increasing numbers, should identify themselves with the sale of **SPECIALIZED** cars. They appreciate the advantages of selling cars equipped with units made by reputable specialists, and they recognize the ultimate dominance of cars in which each unit is a masterpiece—such a masterpiece, for instance, as the motor that bears on its crankcase that widely known symbol of **SPECIALIZATION**—the Continental Red Seal.

## Executives Should Foster Use of Standards

Proper use of standard specifications, fittings and dimensions tends to eliminate waste, save time and cut expenses. Engineers know the value of standards, but executives have, in general, failed to realize their importance and encourage their use.

By Herbert Chase

**E**XECUTIVES in the automotive industry know in a general way that standardization work has been going on in their industry for many years. They doubtless believe in it as a more or less desirable thing, but there are many evidences that they do not appreciate its value to them as a means of simplifying detail, saving time and waste and cutting the cost of their product.

These are days when economy counts, so it will pay every executive who is interested in minimizing expenses to ask himself the following questions:

1. Do the various departments of my business know about existing standards, and are they following and co-operating in the development of standards where no standards now exist?

2. Are standard specifications for material and parts, standard mounting dimensions and the like, employed to the fullest extent practicable in the engineering, purchasing, production, selling and service departments of my business?

3. Is there, in cases where non-standard material etc. is not being used, good reason for not following standard practice?

4. Am I encouraging my subordinates to study and employ standard practice wherever it is applicable?

5. If standard practice is not being employed, is the fault with my product, or with the standard?

If the first four questions cannot be answered in the affirmative, there is no time like the present to investigate and supply a remedy for the situation.

Executives who are not thoroughly sold in respect to the value of standardization, or consider the matter quite too intangible for serious consideration, are urged to read the following facts, for without some such concrete information the whole matter will remain too indefinite for its inherent benefits to be appreciated.

An analysis of estimates made by about 150 engineers and executives in the automotive industry shows that the saving resulting from the use of standards amounts to about 15 per cent of the retail price of the product. If the total value of automotive products produced in this country annually is taken at five billion dollars, the saving on this basis amounts to \$750,000,000, a sum sufficient to warrant consideration even by those who do a business of the proportions mentioned.

Steel manufactured to standard specifications can, in some instances, be had for one-third to one-half the price charged for special steel rolled to a special

gage, such as was often used before steel specifications were standardized, and is still used in some cases.

One manufacturer who supplies rubber goods to other automotive manufacturers states that standardization has enabled him to increase his production threefold with precisely the same equipment as was formerly used to produce one-third its present capacity.

There is almost universal recognition of the fact that standardization within a given plant results in economies which, if not realized, place the manufacturer in an unfavorable position to compete with other plants which realize economies through standardization. Can it be doubted that similar economies would result in plants from which a certain group of manufacturers purchase if these manufacturers would agree on a certain set of uniform specifications, providing a reasonable range for selection, but maintaining uniformity where the deviation is now inconsequential? The manufacturer who is arbitrary in making purchases, even when the quantity is large, is certain, in the long run, to pay more than he would for a standard article. The salesman may attempt to disguise the fact in his zeal to land the order, but if each customer of a given manufacturer demands a special article which involves special tooling and other unnecessary expense, these expenses are inevitably included in the price at which the product as a whole is sold.

A certain spring manufacturer recently stated that he is compelled to stock some 150 sizes and grades of spring steel. He formerly carried nearly double that number of sizes. There is now a standard for the width of spring stock, and the establishment of standards for thickness of leaves is in contemplation. This should result in considerable economies. In the meantime the car and truck manufacturer is, of course, paying the spring maker the cost of carrying a large stock of steel in a much greater number of sizes than there is any real need for having.

Makers of electrical apparatus who build lighting generators and starting motors for many car manufacturers state that the generator used for one car is seldom the same as that employed for another make, and the same is largely true regarding starting motors. The standard S. A. E. mountings are a step in the right direction. They are used quite generally for starting motors, but not so generally for generators.

#### Added Cost of Non-Standardization

Of course, each car manufacturer pays for special tooling and machine set-up in order to get the particular size and shape of generator or motor desired. This is probably a relatively small item in a large order, but it effectively prevents standardization by the electrical manufacturer on a few sizes and types, and the cost is necessarily higher. This fact may not bother one electrical manufacturer at all so long as competitors have to face the same conditions, for the car manufacturer pays the bill. The car builder, in turn, passes on the cost to the purchaser.

Now all this and hundreds of similar circumstances would not be so serious were it not for the fact that service becomes far more expensive than there is need for it to be, and this, again, places an unnecessary burden upon the car owner. The parts manufacturer is expected to establish service stations where stocks of spare parts are presumably maintained for ready replacement. Much money is tied up in these stocks and much detail is involved checking and keeping the stocks complete. Yet this is only one item out of scores which must ultimately receive attention in a complete servicing system. So complexity grows, and with it expense of

service increases. Is it any wonder that the user has ground for complaint?

Factors of this kind have received far too little attention on the part of automotive manufacturers. In days when the demand for cars was always less than the supply it was perhaps natural that they should be more or less neglected. Under present and future conditions first cost and maintenance cost are and will continue to be factors having a great bearing upon sales resistance. No sane manufacturer who contemplates remaining in business can afford to overlook them. They must be minimized, and one means to this end is standardization.

#### No Throttling of Initiative

The foregoing should not be interpreted as a plea for throttling initiative, or for making all cars so nearly alike that they differ only in name or in external appearance. Far from it. It is rather a plea for using individuality where it counts rather than in details which have no bearing whatever upon performance and but little upon external appearance. When designing an engine, why not use a standard size of exhaust pipe and provide for mounting a generator which is now in general use and giving good satisfaction? If a new gearset or axle is in contemplation, why not employ standard sizes of bearings already widely distributed, and standard sizes of splined shafts, for example? If new springs are to be fitted, at least select a standard width of stock and a leaf thickness which is easily obtained. A suitable combination can, no doubt, be used to give the desired riding quality without selecting an odd size of stock. The manufacturer who fails to do things of this kind is certain to pay the penalty in higher prices or in failure to give satisfactory service when conditions demand it.

Granting, now, that a case for standardization has been established, what is to be said regarding existing standards and of the means employed for bringing standards into existence?

There are in the automotive field to-day some 300 standards, most of which have been established as a result of painstaking endeavor on the part of the Society of Automotive Engineers. Many of these standards have been extensively used, and some of them have almost universal application. Others are, for various reasons, but little used. For many years the S. A. E. has maintained, largely at its own expense, an office organization which, under the direction of a Standards Committee, has done the great amount of routine and detail work required in the intelligent creation of standards and the dissemination of information regarding them. Hundreds of manufacturers in the industry have co-operated in this work, but on the whole there appears to be but slight appreciation of its great value. In any case the work has been carried forward more through the initiative of the society than as a result of a spontaneous demand on the part of the industry.

As compared to the manufacturer, the designing engineer has but little to gain from standardization. It saves him time and annoyance over details which would otherwise require his attention, and thus leaves him freer to concentrate on other problems; but it is the manufacturing and purchasing departments which profit most. Strange to relate, but little pressure for standards has come from this quarter.

Aside from their convenience there is but little incentive for the engineer to employ standard practices. The economy they effect is not always apparent on the surface, and he is too seldom given credit for such economies. The manufacturer should furnish the necessary

incentive. He should, in fact, encourage the use of standards from the very inception of the design.

Standards should not be regarded as fixed practice which cannot be changed as conditions change, for such is not the case, so far, at least, as the term applies to standards adopted by the S. A. E. Standards require change from time to time, and there is adequate machinery for this purpose which is easily set in motion when there is a demand for it. Hence the fact that some existing standards may be open to just criticism is no excuse for general criticism of standardization work. If any group of manufacturers find existing standards unsatisfactory, they can easily initiate a reconsideration of the standard with a view to bringing it up to date or in closer harmony with existing conditions.

In one or two instances certain groups of manufacturers have taken a dog-in-the-manger attitude regarding standardization—they have insisted that they were the only group which should presume to set standards, and yet have then failed to establish standards that are admittedly needed.

The creation of standards requires much painstaking work and must not be lightly considered. It matters but little who does the work so long as it is well and thoroughly done, but since the S. A. E. has had long and creditable experience in this direction, is impartial and has a well-trained organization in the field, there would seem to be every reason to encourage and support the work it is doing. The strange fact is that encouragement to date has been more or less passive or sporadic rather than active and continuous.

Probably no single thing would be more helpful to automotive manufacturers in their efforts to minimize production and service expense than to appoint a committee which would make it its business to see that the standardization work of the S. A. E. is encouraged by all possible means and, if possible, carried forward on a much more extensive and intensive scale than ever before.

Standardization is an important factor in foreign trade, perhaps even more than in domestic. Germany has recently awakened to this fact and is planning to apply it fully in her efforts to regain the foreign commerce she lost during the war. Her plans, in fact, indicate that she means to carry standardization much further than it has been carried heretofore. The British also are awakening to the possibilities of the situation and have much commendation for the great progress which standardization has made in this country and the important influence which it has had on the rapid growth of the automotive industry here. Having achieved so much it is important that we maintain the advanced position which we now hold. It is no time to let the grass grow under our feet.

Several divisions of the S. A. E. Standards Committee will present reports at the annual meeting of the society to be held in New York during automobile show week. Engineers and other representatives of manufacturers are welcomed at the Standards Committee meeting on Jan. 10, whether they are members of the society or not. A summary of the reports to be presented at this meet-

ing is given on the following pages, and the full reports are printed in the December number of the journal of the society. Manufacturers should manifest interest in the work by having their engineering and production departments scrutinize the reports and discuss them.

## REVIEW OF STANDARDS REPORTS

**Tachometer Drive (Aeronautic).**—Experience having shown that the driving element of the present recommended practice is not strong enough to prevent binding in the tubing, due to the tendency of the flexible shaft to untwist, it is recommended to change the diameter of the driving shaft from 0.152 to 0.187 in., and the drill size for the hole for the shaft from No. 20 to No. 11, the tolerances remaining the same.

**Annular Ball Bearing Tolerances.**—Upon complaint of a user that the tolerances on the bores of inner races were too great to permit accurate fits in all cases, a subcommittee investigated the practice of the ball bearing industry and found that the actual dimensions of these bores are usually between nominal and two-thirds the minus limit, and very seldom on the plus side of the nominal dimension. It is felt that the tolerances now specified in the S. A. E. standards can be reduced without hardship on the ball bearing industry, and it is suggested

to eliminate the plus tolerances entirely and make the minus tolerances 0.0004 in. for 4-25-mm. bores, 0.0005 in. for 30-55-mm. bores, 0.0006 in. for 60-80-mm. bores, 0.0007 in. for 85-110-mm. bores and 0.0008 in. for 120-210-mm. bores.

**Roller Chain Sprocket Cutters.**—A table of dimensions of these cutters is presented, giving the pitch, cutter bore, outside diameter and keyway dimensions for cutters for sprockets of different pitch and roller diameters. The following extension to the present

S. A. E. standard for such cutters is recommended: "Two straddle cutters shall be used, an A cutter having an average pressure angle of 23 deg., for use where the arc of contact between the chain and the sprocket is fairly large, and a B cutter having an average pressure angle of 17½ deg., for use only where the arc of contact is small.

"All cutters shall be marked with the pitch, roller diameter and the range of the number of teeth for which each cutter is designed."

**Roller Chain Breaking Strengths.**—It is recommended that the minimum breaking strengths as given by the following formula be specified:

Min. Breaking Strength in Pounds =  
105,000 (Pin Dia.)<sup>2</sup> — 700.

It is also recommended that the thickness of center plates for double, triple and quadruple chains shall be equal to twice the thickness of the inside plates in standard single roller chains.

**Insulated Cable.**—It is recommended to substitute carbon tetra chloride for caustic alkali solution as a cleansing medium for the copper wires of insulated cables, as the latter leaves the wire in a condition where it is likely to be attacked by the sulphur in the rubber insulation, and is, therefore, not used. It is further recommended that the strength of the sodium poly-sulphide solution be definitely specified as of a "specific gravity 1.142 at 70 deg. Fahr.

---

**THE** unanimous verdict of those who have investigated the facts is to the effect that standardization pays. The executive who is not encouraging the use of standards in his own plant is overlooking possible economies which existing conditions demand. Ten minutes spent in reading this article should convince him of the facts. Standardization is not an abstract thing of doubtful value. It is a modern economic necessity yielding many concrete advantages. Put it to work on your behalf.

---

**Generator Flange Mounting.**—A slight change in the dimensions of the length of the shaft end from the hub to the center of the cotter pin hole, and of the overall length of the shaft end is recommended, the object being to make the length of the threaded portion of the shaft end practically the same for both No. 1 and No. 2 flanges and permit using the same shaft end in either size of generator.

**Starting Motor Flange Mountings.**—It is recommended that the drill holes for the holding bolts be made 7/16 in. instead of 13/32 in., which will permit the use of a more common drill size, increase the clearance for the bolts and facilitate assembling on the engine.

**Flexible Steel Conduit.**—The present specifications are to be revised to conform to the revised standards for insulated cable adopted last July. The table of dimensions, which now covers sizes from 3/16 to 1 in. inside diameter, is extended to cover sizes up to 1 1/4 in. The table also includes additional columns covering limiting inside diameters, approximate net weight per 100 ft., minimum tension and minimum radius for bending test. In addition to the galvanizing test in the present specifications the new specifications give tests for insuring mechanical quality, directions for installation and general information.

**Non-Metallic Conduit.**—A new recommended practice covering the use of this material for automobile wiring is suggested. The table of dimensions is uniform with that for flexible metallic conduit. General information and rules for installation are given, as well as specifications for insuring quality.

**Carburetor Flanges.**—It is recommended that the flange size for 1/2-in. carburetors shall be the same as that now specified for 5/8-in. carburetors, and that for 3/4-in. the same as now specified for 7/8-in., the object being to reduce the number of flange sizes by two.

**Engine Numbers.**—In order to make it difficult for thieves to obliterate or change engine numbers the following system of numbering engines is suggested:

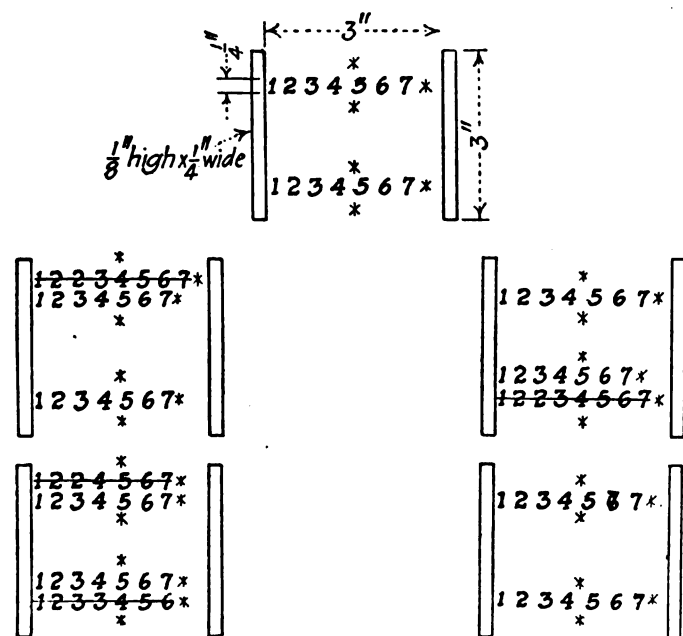

FIG. 1—METHODS OF NUMBERING ENGINES

The arrangement in the single view at the top is correct and the numbering in the upper pair of drawings is acceptable, only one number having been corrected in each case. The lower pair of drawings show two cases that are not permissible; in the drawing at the left both numbers have been corrected or changed, while in the other drawing a single digit has been corrected by stamping a second digit over the original one

"The engine serial or identification number shall be placed near the top of the right-hand side of the crankcase proper in a position in which it can be read easily. It shall be between two vertical ribs or beads 1/4 in. wide, 1/8 in. high, 3 in. long and 3 in. apart, as shown in the single drawing at the top of Fig. 1. The surface of the casting between the ribs shall be left rough as cast and unpainted on the finished engine. The numbers shall be evenly stamped in the casting 1/32 in. deep and shall be 1/4 in. high and of script form. The first digit shall be stamped close to the left-hand rib and the last digit shall be followed by a large star or other character to prevent adding digits. A star or other character also shall be stamped immediately above and below each number to prevent adding another number. The numbers shall be stamped twice on each casting, as illustrated, to permit correcting any errors made in stamping either number. No other number or character shall be placed within the space provided.

"If an error is made in stamping one number it may be crossed out and the correct number stamped in immediately above or below, as shown in the upper pair of drawings in Fig. 1. In no case shall both numbers be crossed out, as shown in the lower left corner, and new ones stamped, and more than three numbers must never appear, one wrong number crossed out and two correct numbers."

#### Reduction in Theft Insurance Premiums

Assurances are said to have been received from the underwriters that a reduction of 7 1/2 per cent in theft insurance premium will be granted if the engine numbering is in accordance with underwriters' requirements, and 20 per cent if both the engine and frame are numbered in accordance with these requirements, which are to be based on the work of the committee.

**Fan Belts and Pulleys.**—Heretofore only flat belt drives for fans have been standardized, but the Engine Division now presents an extension of the recommended practice covering both flat belt and Vee belt drives, fan pulley spindles for both solid and slotted brackets and pulleys for flat and V belts. The distance between the rear face of the collar on the spindle and the center of the pulley and that between the center of the pulley and the rear face of the radiator are to be standardized.

**Engine Testing Forms.**—Some minor additions to the data to be entered on these forms are suggested, and it is also to be proposed that results be corrected to a temperature of 60 deg. Fahr. and 29.92 in. mercury by using the formula:

$$B. Hp_c = (B. Hp_o \times P_s) \div (P_o \sqrt{T_o/T_s}),$$

where

B. Hp<sub>c</sub> = corrected brakehorsepower

B. Hp<sub>o</sub> = observed brakehorsepower

P<sub>s</sub> = standard barometric pressure in inches of mercury

T<sub>o</sub> = observed absolute temperature in degrees fahrenheit

T<sub>s</sub> = standard absolute temperature in degrees fahrenheit

**Mufflers.**—Nine sizes of cylindrical mufflers are recommended for standardization, and diameters of exhaust pipe and tail pipe are given for each. The length of the exhaust pipe from the manifold to the muffler is to be not less than 5 ft. Muffler mountings are to be standardized later if it seems desirable.

**Running Board Brackets.**—A design of pressed steel running board bracket for passenger cars is presented. The length of the horizontal portion of the bracket is left open and three heights, from the top of the horizontal portion to the center of the two lower rivet holes, are provided for; namely, 4, 6 and 8 in.

**Iron and Steel Specifications.**—A very lengthy report

has been prepared by the Iron and Steel Division which revises all of the work ever done by this division and brings it up to date. The standards for which this division is responsible are also better systematized. Charts of physical properties are issued for the first time for the 3200, 3300 and 3400 series of steels (nickel-chromium). Emphasis is laid on the fact that the values given in these charts are conservative for sections from  $\frac{1}{2}$  to  $1\frac{1}{2}$  in. in diameter or thickness, and it is stated that similar charts for sections above the upper of these sizes will be prepared later.

### Eight Types of Heat Treatment

All heat treatments are reduced to eight types, and in order to obviate confusion with the older heat treatments, which were designated by capital letters and are specified in this way on many blueprints, the new heat treatments are designated by Roman numerals. The temperatures for use in connection with these heat treatments are not fixed generally, but are given in connection with the composition of the steel to which the heat treatment is to be applied. As the same type of heat treatment is used for a number of different steels, this plan makes it possible to specify temperature limits more suitable for the particular steel to which the treatment is to be applied.

The S. A. E. system of code numbers for identifying grades and types of steel is continued. The first figure indicates the class to which the steel belongs: thus "1—" indicates a carbon steel; "2—" a nickel steel, and "3—" a nickel-chromium steel. In the case of the alloy steels, the second figure generally indicates the approximate percentage of the predominant alloying element. Usually the last two or three figures indicate the average carbon content in "points" or hundredths of 1 per cent. Thus 2340 indicates a nickel steel of approximately 3 per cent nickel, 3.25 to 3.75 and 0.40 per cent carbon, 0.35 to 0.45; and 71360 indicates a tungsten steel of about 13 per cent tungsten, 12 to 15, and 0.60 per cent carbon, 0.50 to 0.70. The basic numerals for the various qualities of steels specified are:

Carbon steels .....	1
Nickel steels .....	2
Nickel-chromium steels .....	3
Molybdenum steels .....	4*
Chromium steels .....	5
Chromium-vanadium steels .....	6
Tungsten steels .....	7
Silico-manganese steels .....	9

The complete data regarding each grade of steel, such as the code number, the composition, certain notes descriptive of the steel and the heat treatments that will apply for such composition and charts showing the physical properties that may be developed by the recommended heat treatments will probably appear on the same page or on opposing pages of the final report and of the data sheets.

Part I of the report, which follows an introduction, deals in a general way with the numbering system and the specifications and notes on heat treatments and physical properties. Part II covers specifications for automotive steels, including manufacture, chemical properties, finish, inspection and rejection. In Part III are given the chemical compositions of all of the S. A. E. steels. Part IV deals with steel castings and Part V with malleable iron. Part VI gives definitions of metallurgical terms (for general information only). Part VII covers test specimens and is a revision of the present

standard, and Part VIII deals with general heat treatments.

The physical property charts, of which 25 are given, are now arranged somewhat differently than formerly, and in connection with them the following explanations are given:

"The charts have been made as valuable as possible to the engineer by indicating what can be expected as the average product of a given composition when treated in the specific manner in  $1\frac{1}{2}$  in. sections. Generally on sizes larger than  $1\frac{1}{2}$  in. lower values will prevail, and on sizes smaller than  $1\frac{1}{2}$  in. higher values will prevail. At the same time the data for the charts have been chosen so as to protect makers of heat-treated stock and parts from unreasonable demands.

"For the sake of simplicity it has seemed advisable to use only average minimum figures for tensile strength, yield point, reduction of area and elongation, based on the following considerations, heat treatment being constant:

- (1) The lowest yield-points and tensile-strengths are produced with steels at the bottom of a given range in carbon.
- (2) The lowest reductions in area and elongations are produced with steels at the top of a given range in carbon.

"Thus, for Steel 1035, the average minimum yield points and tensile strengths are given as of a steel containing 0.30 per cent carbon; average minimum reductions of area and elongations as of a steel containing 0.40 per cent carbon.

"The figures for hardness are conventional averages for the whole range of compositions within any given specification.

### Charts on Steel Tests

"The charts include treatments and conservative physical tests on all S. A. E. steels for which such charts have been prepared. For these charts the following applies:

- (1) They indicate the physical properties which may be expected of a standard 0.505 x 2-in. test-specimen machined from rolled bars of  $1\frac{1}{2}$ -in. diameter or square.
- (2) Heat-treatments given in the charts apply to rolled bars that were normalized or otherwise treated prior to heating and quenching as shown on individual charts.
- (3) Test-bars 0.505 in. in diameter and 2 in. long, machined from rolled bars after final treatment and tested under normal commercial conditions.
- (4) Brinell and scleroscope readings were taken at a distance from the center equal to half the radius and are not to be compared with surface readings on heat-treated bars or parts.

**Water Pipe Flanges.**—Dimensions for water pipe flanges are recommended, a drawing and table being given similar to the standard on carburetor flanges. This is to supersede the present recommended practice that standard two- and four-bolt types of carburetor flanges be used for motor boat water pipe flanges. The type of flange now recommended is believed to be satisfactory for general automotive use.

**Lock Washers.**—A new table of standard dimensions for lock washers is presented which differs from the old table mainly in making the washers somewhat lighter. The old table was adopted in 1911 and the revision conforms to advances in lock washer practice since that date. The new table is largely the outcome of a request made by the Motorcycle Division for the formu-

\*This numeral has been agreed upon as the index to the Molybdenum group but no specific compositions have as yet been recommended by the Iron and Steel Division.

lation of a series of extra light lock washers for use on motorcycles.

**Passenger Car Door Handles.**—In order to permit interchangeability of handles and locks it is recommended that the square portion of the externally threaded type be made 5/16 in., with a 1/4-in. 28 S. A. E. thread 3/8 in. long, with a 45-deg., 1/32-in. chamfer at the outer end; and the internally threaded type with a 5/16-in. square portion, drilled with a No. 21 drill 3/4 in. deep and counter drilled with a 13/64-in. drill 1/8 in. deep; the drill hole to be tapped with a No. 10 32-in. thread of a usable length of 5/8 in., the pitch diameter limits being 0.1713 and 0.1718 in.

**Passenger Car Doors.**—The following clearances are recommended for all types of body and are to be measured from wood to wood or metal to metal before painting. Door flange widths are to be 5/16 in. on the hinge pillar side and 1/2 in. minimum on the lock pillar side and on the bottom:

PROPOSED DOOR-FIT CLEARANCES

Location	Clearance, in.
Hinge side .....	1/8, $\pm$ 1/32
Lock side .....	3/16, $\pm$ 1/16, — 0
Bottom .....	1/4, $\pm$ 1/16, — 0
Top .....	1/8, $\pm$ 1/32
Jamb .....	3/16, $\pm$ 1/16, — 0
Bead .....	3/32, $\pm$ 1/32, — 0

**Rubber Bushings.**—The Passenger Car Body Division recommends the following for adoption as recommended practice: Where holes are punched in sheet metal for carrying grommets or bushings, particularly when these are made of rubber, it is recommended that the holes be necked.

The reason for this recommendation is that when bushings for electric wiring or conduit are inserted in plain holes punched in sheet metal they are quickly cut by the sharp edges, and it is relatively simple and effective to form a neck to the hole when punching.

**Wiring for Beads.**—To economize in the number of sizes of wire used in the manufacture of parts of beaded construction, such as fenders and splash guards, it is suggested that for engine hoods up to and including 36 in. long, top hinge rods shall be 5/16-in. diameter, and side hinge rods shall be 1/4-in. diameter. For fenders, aprons and splash guards the wire used for beading shall be No. 11 B.w.g. bright basic steel wire.

**Pressure Gage Connections.**—Three diameters of tubing are provided for, 1/2 in., 5/16 in. and 3/8 in., the first two being used on passenger cars and the last on trucks. The size of aperture recommended is the same for all three sizes of connection, as the area of this opening need not vary for different tubing sizes. As the aperture is frequently drilled in a plug that is screwed into the connection, and as plugs fitting a hole tapped with No. 10-32 thread are usually used, the specification of this thread is included in the recommendation. A 1/8-in. pipe thread connection also is sometimes used, and is recommended as an alternative construction.

**Pneumatic Tires and Rims.**—It is proposed to revise the present list of standard sizes of pneumatic tires and rims by eliminating the 32 x 3 1/2, 33 x 4, and 33 x 4 1/2-in. rim sizes and the corresponding regular and oversize tire sizes, and by adding the 30 x 3 1/2-in., straight-side rim and the 31 x 4-in. oversize, straight-side tire.

#### No Immediate Discontinuation

Particular emphasis is laid on the fact that this recommendation is not intended to call for immediate discontinuation of all other tire or rim sizes. Non-standard sizes will of necessity continue in production on a de-

creasing scale until those automotive vehicles now in service which are equipped with non-standard rims and tires are finally discarded.

A review of the standardization of pneumatic tires shows that the original list of sizes which was first adopted by the Association of Licensed Automobile Manufacturers nearly 15 years ago has been changed at very frequent intervals, additions generally being made until during the latter part of the recent war a definite schedule for eliminating certain sizes by groups at stated intervals of time was approved. The standard, however, instead of becoming more effective, was more or less disregarded by many car and tire manufacturers for use on new equipment. This condition was one of the influences that led to a lack of co-operative effort and the differences of opinion among the groups interested.

#### The Cleveland Conference

As the result of this situation a conference was held in Cleveland in November, 1920, which was attended by tire, rim and automobile manufacturers and at which a resolution was passed that the society should appoint a special committee representing the National Automobile Chamber of Commerce, the Rubber Association of America and the Society of Automotive Engineers for the purpose of carefully studying the existing conditions and preparing a recommendation which would meet with the approval of the industry and the national organizations representing its various branches.

The committee thus appointed conferred with the automobile and tire manufacturers and carefully analyzed the situation. The division recommends that the proposed list be used by passenger car and motor truck designers to select tire sizes for apparatus not yet in production, or at such a time as a change to a recommended size can be conveniently made.

It is also recommended that for figuring speedometer gear ratios and fender and wheel housing clearances the actual tire widths and outside diameters be measured on the tires to be used.

**Tractor Drawbar Height.**—The following extension to the present recommended practice is proposed:

PROPOSED TRACTOR DRAWBAR HEIGHTS

Plow	Two-Bottom		Three-Bottom		Four-Bottom	
	12-in.	14-in.	12-in.	14-in.	12-in.	14-in.
A	30	30	32	32	40	40
B	15	15	20	20	24	24
C	17	20	23	26	28	32
D	15	15	20	20	24	24

A—Maximum position for good operation, ordinarily the best possible position.

B—Minimum position for good operation with the tractor operating on the land.

C—Proper or best average position when the tractor operates on the land.

D—Minimum hitch position when the tractor operates in the furrow.

**Transmission Tire Pump Mounting.**—It is suggested to cut back the inside edges of the large mounting pad so as to allow more clearance for the idler pinion car-

rier. The two long sides are to be cut away  $3/16$  in. between bolt holes.

**Clutch Facings.**—In order to reduce the number of sizes of clutch facings used and thus gain the advantages of the resulting economy, two tables of dimensions are presented, one for multiple disk and the other for single disk clutch facings. The tables specify thickness, inside and outside diameters, with tolerances on all dimensions. It is also planned to standardize rivets and their location, but this will require further study. The clutch facing sizes are intended for use on new designs only.

**Three-Joint Propeller Shafts.**—Diagrams and tables are given for three types of shaft end, viz., square, tapered and splined.

**Bases, Sockets and Connectors.**—Limits of 0.306 in. and 0.312 in. are added to the distance from the end of the plunger sleeve to the top of the locking slot, the limit of 0 to  $1/64$  in. for the distance from the top of the plunger when extended to the bottom of the locking slot is eliminated and a footnote referring to the locking pins and slots of the bases, sockets and plugs is to be added, to the effect that the variation from the center line shall not be more than 0.003 in.

**Lamp Glasses.**—It is recommended that in the standard for lamp glasses the dimensions for four locking notches be specified, which are required to prevent the turning of other than plain glass lenses in their mountings. These notches are to be  $17/32$  in. wide and  $3/32$  in. deep.

**Tail Lamps.**—Tail lamp mounting dimensions are recommended. Two  $1/4$ -in.-20 mounting studs are to project from the rear of the lamp housing a distance of  $5/8$  in., these studs being on the horizontal axis 1 in. from the vertical axis each. The tail lamp glass diameter is to be 3 in. plus 0, minus  $1/32$  in. The projection of the socket from the lamp shell is to be  $1\frac{3}{4}$  in.

**Non-Ferrous Metal Specifications.**—The same as the Iron and Steel Division, the Non-Ferrous Alloys Division has revised the specifications for which it is responsible and has added to them particularly specifications of solders. As far as possible the new specifications

have been drawn up to accord with the specifications of the American Society for Testing Materials. Specifications Nos. 1, 2, 3 and 4 cover solders; No. 14 covers babbitt; No. 43, manganese bronze; No. 44, cast brass to be brazed; No. 45, brazing solder; No. 70, commercial brass sheet; No. 71, copper sheet; No. 73, naval brass (Tobin bronze) rod; No. 76, naval brass (Tobin bronze) tubing; No. 80, brass spring wire; No. 81, phosphor bronze spring wire; No. 88, brass forging rod.

**Rod Ends.**—The following is to be incorporated in the standard on this subject:

- (1) Specify dimension *K* as the diameter of the pin-bosses on the drawings for the adjustable and plain yoke-rod-ends, the same as now specified for the pin-boss of the eyerod-end.
- (2) Change dimension *K* in the table for the  $3/8$ -in. size from  $1-13/16$  to  $1-11/16$  in.

**Taper Fitting for Plain or Slotted Nut.**—A footnote is to be added to the effect that the center line of the cotter pin hole shall be 90 deg. from the position of the keyway, as shown on the drawing. This recommendation is made merely with the object of insuring uniform practice.

**Body Nomenclature.**—The Passenger Car Body Division submits a list of names for different body types. In selecting the names the committee bore in mind the derivations of the several terms, their application to their now more or less obsolete horse-drawn prototypes and the accepted European or international usage. The most radical change as compared with present usage is the proposal to use the term phaeton for what is now generally known as touring car. The principal reason for suggesting the change is that the term touring body has lost its significance as applying to any particular type of body, as all types are used for touring. The term "phaeton" is used extensively in Europe and to a considerable extent in America in connection with passenger cars; it is the name of a horse-drawn prototype; touring body is inelegant and in a technical sense is not distinctive of any particular type of motor vehicle body. The committee distinguishes 15 types of body and gives illustrations of all, but as yet has not decided on a name for two of them.

## Tractors for South Africa

A REPORT recently received by the National Bank of South Africa, Ltd., from the British Trade Commissioner at Capetown on conditions affecting the working of motor tractors in that territory gives some interesting data on the type of machines required for agricultural purposes there. The loss of power in internal combustion engines, due to the high altitudes met with in South Africa, is to some extent modified by the lower average temperature at higher altitudes; but nevertheless, the difference is considerable, approximately 10 per cent. at 4000 ft., and well worth consideration from the designer's point of view. Engines should be sturdily built, and able to give their full-rated power at less than 1000 r.p.m. It would be better if their general rate were nearer 600. The reduced speed of an engine working under these conditions leads to a very great increase in the working life of the engine, and makes it altogether a smoother running engine. The South African soil after a drought becomes very hard, and even in what is considered easy soil, hard patches are met with. Very little easily-broken soil is found

in the country. Under certain conditions clouds of dust are raised in the operation of ploughing, and this is of a particularly fine penetrating type. The effect of dust on the engine can be readily imagined. The farmers of South Africa in considering the merits of plows usually insist on land being plowed in its hardest condition, for the reason that it would have to be plowed by oxen under similar conditions, and if a tractor will not do it the tractor is of no use to them. The South African farmer does not usually employ a skilled mechanic ready to tune the engine to suit the varying temperatures. A machine that requires nursing is not desirable. The machine which is required is one that is capable of being overdriven and overworked in order to get the work done, and as soon as the machine has proved its worth the cheapest kind of labor will be employed to be put in charge of the tractor. Furthermore, a cheap lubricating oil is likely to be used regardless of the possible effect on the tractor. The tractor to be sold in South Africa must be capable of doing well under the worst conditions.

# Design Variations Feature British Light Cars

Widest possible divergencies occur throughout the range, which runs from 60 cu. in. twin-cylinder air-cooled two-seaters to overhead valve fours of 140 cu. in. capacity selling at \$3,600. This article contains descriptions of several of these light cars that have come so much to the fore.

By M. W. Bourdon

THE light car movement, owing to the entry of several of Britain's most important motor manufacturers into this line of production, has assumed more importance than ever. Daimler, through its associated concern, the B. S. A. Co.; Armstrong-Siddeley, Humber, Wolseley, Standard, Rover, Calthorpe, Singer, Austin, Vulcan, Belsize, Star, Sunbeam and a score of other firms of more or less renown are now producing, or exhibited at Olympia, two-seaters and four-seaters which belong to this class.

The lowest priced of the light cars produced by the firms mentioned is the two-seated, 8-hp., horizontal, air-cooled, twin-cylinder Rover, which has dropped in price from £300 to £220 during the year. The most expensive is the Sunbeam, which has a four-cylinder engine of approximately 118 cu. in. and sells at £725 with four-passenger body.

In between the above is almost every imaginable variation in price, cylinder number, cylinder arrangement and cooling. Some are sold with a regular two-seated body, others with a two-seater with double dickey; the remainder (with one exception) have optional bodywork, i. e. two-seater with double dickey or four-seater. The exception is the Armstrong-Siddeley production, known as the Stoneleigh utility car, which has a three-seated body of reversed clover-leaf pattern; driver's seat, steering and controls are central, with the rear two-passenger seat removable to provide space for up to 250 lb. baggage.

The most notable development during the past twelve months has been encouraged by the success of the 8-hp. Rover (described in AUTOMOTIVE INDUSTRIES of Sept. 1 last). It has sold quite freely and deliveries at several periods during the year were a month or so behind orders, despite an output of 120 per week, which is the largest of any one British model. The little Rover, when it was first put forward, was the cause of considerable ridicule directed at its makers; having done well with their 12-hp. model (still continued) they were held to be adopting a policy that would lower their prestige. But the Rover company has shown foresight rarely exhibited; it has almost created a demand, and the popularity of the 8-hp. two-seater has, without question, been entirely responsible for the introduction of the B. S. A., 7-hp. Wolseley and Stoneleigh. However, only the Stoneleigh—which is not yet in production—offers attractions comparable to those of the Rover, and the latter at the moment appears to be threatened but very slightly. Primarily, it scores over its would-be competitors in price (except the Stoneleigh at £225), for the B. S. A. and Wolseley are offered at £340 and £310 re-

spectively, though admittedly both of the latter are worth more than and possibly almost as good value as the Rover. But their price takes them out of the range of the Rover appeal, for the man who has £300 or so to put down can get and usually prefers a four-cylinder light car.

The light car movement, as distinct from the early cycle car boom, started with a four-cylinder engine of under 67 cu. in., and a number of firms, such as Singer, Calthorpe and Swift, are still concentrating mainly on this. Standard originally was in this field, and then got out of it with an engine of approximately 100 cu. in., though still continuing to offer both the two-seaters and four-seaters of 11 hp. as "light cars." Calthorpe was first to offer one of the smaller four-cylinder types with a four-passenger body, after having increased engine capacity to 76 cu. in.; this four-seater, however, is more of a "sporting" type, with passenger accommodation hardly likely to be appreciated by elderly aunts and similarly staid individuals. But Standard has now gone back to the original size of engine, though retaining the larger model after increasing its engine and chassis dimensions for 1922. The new model is designated an 8-hp., though its engine dimensions are identical with those of the pre-war two-seater rated at 10 hp., the displacement being 66 cu. in.; and yet it is offered with a comparatively comfortable four-passenger body as an option to a two-seater with double dickey. Wolseley retains the 10-hp., four-cylinder model (76 cu. in.) and also offers bodies for two or four adults.

Next in point of engine size comes the biggest variety of all, the type so prominent at the 1920 show, and having an engine displacement of approximately 90 to 100 cu. in., with chassis designed for two-seated and four-seated bodies. The Morris is one of the most popular examples of this type, with a four-cylinder,  $2\frac{3}{4} \times 4$ -in., water-cooled motor; it sells at £446 with four-passenger body and at £340 with reduced equipment and less elaborate finish. With two-passenger bodies prices are £400 and £300 respectively—the latter a reduction of 30 per cent since last year.

Above the Morris class in point of engine size (or chassis dimensions) come the new 12-hp. Austin (100 cu. in.), the 11-hp. Humber (the 10-hp. of the 1920 show enlarged to 106 cu. in.), the 11-hp. Standard enlarged to 118 cu. in., the 14-hp. Sunbeam, also 118 cu. in., and numerous others.

All of these cars, from the 61-cu.-in. Rover to the 118-cu.-in. Standard, except the Humber, Austin and Sunbeam, are offered as light cars, and their makers are annoyed if anyone suggests that they are not light cars.

## Features of British Light Cars

Fig. 1—New B. S. A. two-cylinder air-cooled runabout. Fig. 2—Overhead valve engine of new 8-hp. Standard. Note combined magneto and lighting dynamo. Production model will have battery ignition. Fig. 3—Rear view of new two-cylinder (65 cu. in.) air-cooled B. S. A. chassis, which is offered with two-passenger body at \$1,700. Has three speed gearset, Lanchester worm drive and full electric equipment. Fig. 4—Chassis of new 7-hp. (60 cu. in.) Wolaeley two-cylinder water-cooled engine. Fig. 5—10-hp. (67 cu. in.) Singer with four-passenger body with attendant alongside to give the idea of size. Fig. 6—New 9-hp.  $3\frac{3}{4}$  x  $3\frac{1}{2}$  two-cylinder air-cooled Stoneleigh (Armstrong-Siddeley). Occupants indicate seating arrangement and general dimensions. Fig. 7—Inverted clover leaf body on new Stoneleigh (Armstrong-Siddeley) air-cooled two-cylinder chassis

One maker who has increased his engine dimensions, giving the car a rating by the usual formula considerably above what it was last year, has reduced the "catalog horsepower" to a lower figure than last year, fearing that otherwise his productions would no longer be looked upon as light cars by potential purchasers, and that he would lose sales in consequence.

From one point of view the majority of British light cars sell at prices which are absurdly high when compared with those of the Ford, Overland, Chevrolet and even the Cubitt, the latter a British production with a  $3\frac{1}{8} \times 5\frac{1}{2}$ -in., four-cylinder engine, four speeds, 126-in. wheelbase and full-sized, five-passenger body, selling at £442. These high prices can only be accounted for by high quality in the chassis, bodywork and equipment.

But first cost is not considered so important as operating costs by the majority of British buyers of light cars. They are willing to put up with the frequent gear-shifting accompanying the small engines if by doing so fuel economy will result. They far prefer the Morris, for instance, capable of running 30 to 35 miles per gallon (Imperial gallon) to the Cubitt doing 16 to 20, though

both can be bought at approximately the same price and the engine of the first has only 94 cu. in. displacement, as compared with 170 cu. in. for the second. Not that the Cubitt is unpopular in its sphere, but it does not make so extensive an appeal as the light car.

Reverting to the smallest types, in the writer's opinion the policy of using two-cylinder engines is one of which the wisdom may be doubted when prices are not kept down to somewhere about the Rover level (£220). While these motors, especially the horizontally opposed type, run quite nicely at all except very low and high speeds, and certainly pull better on hills than many of the high-speed fours of similar cubic capacity, they have been accepted so far merely because the buyers feel they must sacrifice something in making their demands for low price and low operating costs. But if, as in most cases, they approach closely the price of the corresponding four-cylinder chassis, it is difficult to see what inducement they offer—beyond in some cases a better finish, perhaps, and a rather more complete equipment.

Following are outline specifications of a few examples of each type of British light cars:

### 11 Hp. A. C.

**Engine**—Four cylinder, detachable L head cylinders,  $2\frac{1}{2} \times 3\frac{1}{4}$  in., 91 cu. in. displacement, aluminum pistons, three bearing crankshaft, pressure lubrication, magneto ignition.

**Transmission**—Dry single plate-clutch, gearset unit with rear axle, three speeds, right-hand lever, enclosed propeller shaft, top worm final drive, 4.5 to 1 ratio, full floating rear axle.

**Chassis**—Quarter elliptic springs, brake on final drive shaft and internal brakes on wheels, worm and worm wheel steering, disk wheels,  $28 \times 3\frac{1}{2}$  in. tires; weight: 1550 lbs. two-seater with dickey.

**Equipment**—Two-seated body, electric lighting and starter, £550. Four-passenger body optional.

### B. S. A.

**Engine**—Two cylinders at 90 deg., air cooled, integral heads, overhead valves,  $3\frac{1}{2} \times 3\frac{1}{2}$  in., 65 cu. in. displacement, aluminum pistons, ball bearing crankshaft, roller bearing big-ends, circulating splash lubrication, magneto ignition.

**Transmission**—Single plate clutch with cork inserts. Gearset unit with engine, three speeds, central control, enclosed propeller shaft, Lanchester bottom worm final drive, 4.8 to 1 ratio, non-floating rear axle.

**Chassis**—Quarter elliptic springs, both brakes within rear wheel drums, rack and pinion steering, disk wheels,  $28 \times 3\frac{1}{2}$  in. tires; weight of complete car 1,350 lb., wheelbase 96 in., track 48 in.

**Equipment**—Two-seated body with single dickey seat, electric lighting and starting, £340.

### 10 Hp. Calthorpe

**Engine**—Four cylinder. Integral L heads  $2\frac{1}{8} \times 3\frac{3}{4}$  in., 76 cu. in. displacement, aluminum pistons, plain bearing crankshaft, trough and pressure lubrication, magneto ignition.

**Transmission**—Dry single plate clutch, amidships gearset, three speeds, right-hand lever, open propeller shaft, spiral bevel final drive, 4.3 to 1 ratio, full floating back axle.

**Chassis**—Half elliptic springs, internal brake on gearset, internal shoes on wheels, worm and segment steering, pressed steel hollow spoked wheels,  $28 \times 3\frac{1}{2}$  in. tires; weights: chassis, 1350 lb., two-passenger complete car, 1650 lb., four-passenger car, 1700 lb.; wheelbase 99 in., track 45 in.

**Equipment**—Two or four-passenger bodies optional, electric lighting and starting, price £355 with two-seated body.

### Crouch

**Engine**—Two cylinders at 60 deg., water-cooled, overhead valves in detachable heads,  $3\frac{1}{2} \times 4\frac{1}{4}$  in., 75 cu. in. displacement, cast iron pistons, crankshaft supported at rear end only on ball and roller bearings, roller bearing big ends, circulating splash lubrication, magneto ignition.

**Transmission**—Dry single plate clutch, gearset unit with front end of propeller shaft casing, three speeds, central lever, enclosed propeller shaft, spiral bevel final drive, 4.5 to 1 ratio, no differential, non-floating rear axle.

**Chassis**—Quarter elliptic springs duplicated at the front, both brakes within rear wheel drums, rack and pinion steering, detachable wire wheels,  $28 \times 3\frac{1}{2}$  in. tires, weight: chassis 900 lb., wheelbase 114 in., track 45 in.

**Equipment**—Two-seated body, electric lighting, starting by usual crank but engaging with camshaft, automatic decompression device, price £275.

### 11 Hp. Humber

**Engine**—Four cylinders, detachable L heads,  $2\frac{1}{4} \times 4\frac{1}{4}$  in. 104 cu. in. displacement, aluminum pistons, three-bearing crankshaft, white metal bearings, trough and pressure lubrication, magneto ignition.

**Transmission**—Inverted cone clutch with leather facing running in oil, unit gearset, four speeds, right-hand lever, open propeller shaft, straight bevel final drive, 4.3 to 1 ratio, full floating rear axle.

**Chassis**—Half-elliptic springs, external brake on gearset and external brakes on rear wheels, worm and worm wheel steering, pressed steel wheels,  $30 \times 3\frac{1}{2}$  in. tires; weight: chassis 1260 lb., two-seater with double dickey 2100 lb., four seated 2200 lb., wheelbase 105 in., track 55 in.

**Equipment**—Two-seater or four-seater optional, electric lighting and starting; price £620, four-passenger.

### 12 Hp. Morris

**Engine**—Four cylinders, detachable L heads,  $2\frac{3}{4} \times 4$  in., 94 cu. in. displacement, cast iron pistons, three bearing crankshaft, white metal journals and big-ends, trough and pressure lubrication, magneto ignition.

**Transmission**—Double plate clutch with cork inserts, gearset unit with engine, three speeds, central lever, enclosed propeller shaft, spiral bevel final drive, 4.75 to 1 ratio, semi-floating rear axle.

**Chassis**—Half-elliptic springs at front, three-quarter elliptic at rear, both sets of brakes internal on rear wheels, worm and worm wheel steering, hollow spoked steel wheels,  $28 \times 3\frac{1}{2}$  in. tires; weight: chassis 1200 lb., two-seater car 1800 lb., four-seater 1900 lb., wheelbase 102 in., track 48 in.

**Equipment**—Two or four-passenger bodies optional, electric lighting and starting, prices from £300 (with electric lighting only and two-passenger body) to £446 with full outfit and four-passenger body.

### 8 Hp. Rover

**Engine**—Two cylinders, air-cooled, set at 180 deg., detachable L heads,  $3\frac{1}{2} \times 3\frac{1}{2}$  in., 61 cu. in. displacement, cast iron pistons, roller bearing crankshaft, roller bearing big-ends, circulating splash lubrication, magneto ignition.

**Transmission**—Dry single plate clutch, gearset unit with engine, three speeds, central lever, open propeller shaft, bottom worm final drive, 4.8 to 1 ratio, semi-floating back axle.

**Chassis**—Quarter elliptic springs, brakes both internal on rear wheels, rack and pinion steering, disk wheels,  $28 \times 3$  in. tires; weight: chassis, 700 lb., car complete, 1000 lb., wheelbase, 88 in., track, 46 in.

**Equipment**—Two-seated body with a small boot for spares, extra wheel and tire, dynamo lighting. Price, £220.

### 10 Hp. Singer

**Engine**—Four cylinders in pairs, integral L heads,  $2\frac{1}{8} \times 3\frac{3}{4}$  in., 67 cu. in. displacement, cast iron pistons, three-bearing crankshaft, white metal journals and big-ends, trough and pressure lubrication, magneto ignition.

**Transmission**—Inverted cone clutch, gearset as unit with front of propeller shaft casing, three speeds, right-hand lever, spiral bevel final drive, 4.5 to 1 ratio, semi-floating rear axle.

**Chassis**—Quarter elliptic springs, both brakes internal on rear wheels, worm and segment steering, disk wheels,  $26 \times 3$  in. tires; weight: two-passenger car complete 1430 lb. wheelbase 96 in., track 48 in.

**Equipment**—Two-seated body with single dickey, electric lighting and starting, price £400. Four-passenger car, £420.

### 8 Hp. Standard

**Engine**—Four-cylinder water-cooled overhead valves push-rod operated,  $2\frac{1}{4} \times 3\frac{1}{4}$  in., 67 cu. in. displacement, aluminum pistons, ball bearing crankshaft, plain bearing big-ends, circulating splash lubrication with thrower disk on crankshaft in place of pump, battery ignition.

**Transmission**—Single plate clutch, gearset front end of propeller shaft, three speeds, right-hand lever, enclosed propeller shaft, bottom worm final drive, 5.1 to 1 ratio, semi-floating rear axle.

**Chassis**—Quarter elliptic springs, internal wheel brakes, worm and worm wheel steering, disk wheels, 28 x 3 in. tires, wheelbase 102 in., track 48 in.

**Equipment**—Four-passenger body or two-passenger with double dickey optional, electric lighting, mechanical hand starter from seat, price £324 with either type of body.

### 9 Hp. Stoneleigh (Armstrong-Siddeley)

**Engine**—Two cylinders, air-cooled, at 90 deg., integral heads, overhead valves,  $3\frac{1}{2} \times$

$3\frac{1}{2}$  in., aluminum pistons, plain bearing crankshaft, articulated connecting rods, phosphor bronze big-end, pressure lubrication, magneto ignition.

**Transmission**—Single plate clutch, gearset unit with front end of propeller shaft, three speeds, central lever, enclosed propeller shaft, spiral bevel final drive, 5 to 1 ratio, no differential, non-floating rear axle.

**Chassis**—Quarter elliptic springs, brakes internal on rear wheels, worm and segment steering, disk wheels, 28 x 3 in. tires; weight: complete car, 1200 lb., wheelbase 8 ft., track 4 ft.

**Equipment**—Three-seated body, inverted clover leaf pattern, driver's seat, steering wheel and controls central, electric lighting, crank starting, price £225.

### 7 Hp. Wolseley

**Engine**—Two cylinders, water-cooled, 180 deg., integral L head cylinders,  $3\frac{1}{4} \times 3\frac{1}{4}$  in., 60 cu. in. displacement, aluminum pistons, plain bearing crankshaft, circulating splash lubrication, battery ignition.

**Transmission**—Inverted cone clutch, gearset unit with engine, three speeds, right hand lever, open propeller shaft, spiral bevel final drive, 5.1 to 1 ratio, non-floating rear axle.

**Chassis**—Quarter elliptic springs, rear ones supplemented by single thick leaf,

secured above frame to assist in taking torque and drive; both brakes internal on rear wheels, worm and worm wheel steering, pressed steel wheels, 26 x 3 in. tires; weight: chassis 800 lb., complete car 1050 lb., 97 in. wheelbase, 44 in. track.

**Equipment**—Two-seated body, electric lighting, mechanical hand starter from seat, price £310.

### 10 Hp. Wolseley

**Engine**—Four cylinders, overhead camshaft,  $2\frac{1}{2} \times 3\frac{1}{4}$  in., 76 cu. in. displacement, aluminum pistons, plain bearing crankshaft and big-ends, trough lubrication, battery ignition.

**Transmission**—Multiplate clutch in oil, amidships gearset, three speeds, right hand control, semi-enclosed propeller shaft, bottom worm final drive, 5.25 to 1 ratio, semi-floating rear axle.

**Chassis**—Quarter elliptic springs, internal wheel brakes, worm and worm wheel steering, hollow spoked steel wheels, 28 x  $3\frac{1}{2}$  in. tires; weights; chassis 1000 lb.; two-passenger car, 1550 lb.; four-passenger, 1770 lb., wheelbase, 99 in., track, 46 in.

**Equipment**—Two or four-passenger bodies optional, electric lighting and starting, price £525 with four-passenger body, rear seats very cramped for two normal sized adults.

## A New Self-Locking Differential

**A**MONG the earliest types of that form of differential gear having provisions made for so much internal friction that it is impossible for the car to be stalled by one of the driving wheels losing traction, was that patented in England in 1911 by Gavin C. Goodhart. Goodhart's early design was quite effective but was discarded as being too expensive to manufacture. The main difficulty of the problem is to obtain surfaces sufficiently large and durable to absorb the friction and withstand the high pressures within the limits of size available. At the same time the device must be simple, easy to manufacture, cheap and effective.

Goodhart has recently developed another design which he claims overcomes the difficulties met with in his earlier model. This new differential has been tried out by the Vulcan Motor Co. on a 2-ton worm-drive truck and by H. G. Burford & Co. on a  $2\frac{1}{2}$ -ton internal gear drive truck.

The Goodhart differential is of the ordinary bevel type with certain modifications. The side gears are made in two parts, viz., the gear itself, which has a ring of conical depressions on its back and is not fixed to the axle directly; and the coupling piece, fitted directly on the axle

in the ordinary way and carrying on its front face a ring of depressions similar to those on the back of the gear and registering with them. Steel balls are placed in these depressions between the two parts of the sun wheels.

These balls transmit the drive, and in so doing try to climb up the sides of the conical depressions, thus causing considerable axial thrust, which is taken on disks of "Ferrobestos" fitted between the flange of the coupling piece and the inside of the housing. The inward thrust, which is somewhat less than the outward thrust due to the outward thrust of the bevel teeth having to be subtracted, is taken on a hardened steel thrust block in the center, which prevents the gear teeth being forced into mesh too deeply.

The aggregate friction thus set up restricts differential action to such an extent that it only takes place when required, while at all other times the gear works as though the axle were divided.

## Belgian Engineers Want Tariff Changed

**A**HIGHER measure of protection against foreign competition is being asked by the general engineering industry of Belgium. Five hundred manufacturers, including all those in the automobile industry, have petitioned the Financial Department in favor of a higher tariff, particularly against German products, and either a greater degree of protection or reciprocity with France. The Belgium automobile import duty is at present 20 per cent, while the French duty is 45 per cent; as a consequence French makers can sell automobiles in Belgium, but it is very difficult for Belgians to compete on the French market. Germany, by reason of the low value of the mark, is becoming a very dangerous competitor on the Belgian market, while the sale of Belgian automobiles in Germany is almost impossible.

It is believed that an arrangement will be arrived at whereby the import duty against German goods will be increased and the French duty dropped to the level of that of Belgium.

Sectional view of Goodhart differential gear

# Refinements in 1922 Handley-Knight

Changes made in the new model include stiffening of frame, lighter and more easily operated controls, substitution of metal for fabric joints and improved battery mounting. Two new closed bodies are added to line.

By J. Edward Schipper

**F**OR 1922 the Handley-Knight chassis has been somewhat changed and refined and two closed bodies, sedan and coupe, added to the line. The touring body remains the same, but the new chassis is used for this as well as for the two new closed bodies, these three body types comprising the line.

The changes in the chassis are largely concerned with giving greater durability through a stiffer and more substantial structure and to increase the convenience of the driver by making the control pieces lighter and, consequently, more readily handled. Some of the changes also have to do with appearance.

The changes in the control system include a rearrangement of the braking mechanism so as to give a greater leverage and, consequently, a lighter pedal action. The gearshift lever is also more conveniently located and operated. Another change on the control is an improvement and rearrangement of the brake equalizing mechanism to give more complete equalization.

The entire propeller shaft assembly has been redesigned and a heavier propeller shaft employed, and in place of the fabric universals Spicer joints are now employed. The Handley-Knight engine has not been altered in any detail except the ignition, which is now the Auto-Lite system.

The structural changes include a stronger tire carrier and a stronger battery box, the latter being supported by two heavy brackets. For greater durability the wiring system has been completely inclosed in conduits and the wiring has been rearranged and simplified.

The changes which have been made for better appearance include wider, deeper and heavier fenders. Thicker running boards, which are now covered with aluminum instead of linoleum. There is now an aluminum cast trim

rail running along the sill at the hood line from the end of the cowl to the radiator. The chassis is now lubricated by the Empress oiling system, which employs a high-pressure oil gun.

The two new closed bodies are the sedan-coupe, which seats four or possibly five, and the sedan, which seats seven. The sedan-coupe justifies its name in its appearance, as it is longer than a coupe body and shorter than a sedan. The seating arrangement is of course, controlled by the two-door body. There are individual chairs at the front, with the seat beside the driver tilting forward, leaving a passageway to the rear. The rear seat is continuous and provides room for two passengers readily and three in an emergency.

The seating in the sedan is the regular seven-passenger layout, with two continuous seats in the front and rear compartments and extra folding seats for two passengers. The seats in both models are tilted at an angle and are all supported by extra heavy cushion springs, deeply padded.

One of the features of the sedan-coupe is the large luggage space available. This is reached by lifting the back of the rear seat, disclosing the entrance to the compartment under the rear deck. With this arrangement the baggage can only be reached from inside the body, which assures protection for the baggage when the doors of the body are locked.

The fundamental specifications of the car have not been altered. The engine is a Handley-Knight sleeve-valve type with  $4\frac{1}{8}$ -in. bore and  $4\frac{1}{2}$ -in. stroke. This engine is cooled by thermosyphon and is equipped with Auto-Lite starting, lighting and ignition; Timken axles with Hotchkiss drive and a Gemmer steering gear are employed. The wheelbase is 125 in.

Plan view of new Handley-Knight chassis. Note heavy cross member and substantial mounting of battery container

# A Dutch Passenger-Carrying Monoplane

Fokker machine now in this country carries six passengers or pay load of 1,000 lbs. with fuel enough for 500 miles. Employs internally braced, veneer covered wing and 200 hp. B. M. W. engine in aluminum sheet covered compartment. Comfortable accommodations for passengers.

By P. M. Heldt

THE remark has often been made that airplanes designed primarily for war purposes are unsuitable for commercial uses. On the one hand, it is impossible with these machines to provide comfortable accommodations for passengers, while, on the other, they are designed mainly for speed and other characteristics that are paramount in war, but without regard to economical operation. It is this factor of economical operation that will mainly determine the success or failure of any enterprise established to carry passengers through the air, assuming that the matter of safety has been given due consideration.

It is a rather surprising fact that whereas there are numerous aircraft passenger services apparently in successful operation in Europe, in this country, where distances are, on the whole, much greater, such services are rare or non-existent. Some of the European lines make use of Fokker monoplanes built by the Netherlands Aircraft Mfg. Co., and of these there are several in this country. This machine is referred to as a six-passenger limousine monoplane, and its outstanding features are comfortable accommodations for the passengers and economy of operation.

A machine carrying six persons with their baggage must necessarily be of considerable size, and would ordinarily be associated with a very powerful engine. But evidently owing to the form of wing construction with internal trussing used in the Fokker, which does away with all struts and truss wiring, the aerodynamic efficiency of this machine is very high, and the engine fitted is a B. M. W. of only 200 hp. output. The Fokker F-3, as this particular model is known, when carrying a full complement of passengers and fuel sufficient for a 5-hours' flight, consumes about 10 gal. of fuel per hour and develops a speed of about 105 m.p.h., thus giving it a flying radius of 500 miles with a 5-hours' fuel supply.

In the location of the fuel tank special attention has been given to the factor of safety. The tank is located between the big spars in the wing and feeds the carburetor through a single pipe by gravity. Being high up, the fuel tank is not likely to be damaged by a bad landing. The tank is so well separated from the passenger compartment that passengers may be allowed to smoke. The radiator is installed in the nose of the fuselage and in cold weather the pilot can regulate its temperature by means of shutters. The engine mounting is of tubular construction and is so arranged that the engine is easily accessible and can be quickly removed when required. For the sake of safety from fire, the whole engine compartment is enclosed with aluminum sheet. Next to the engine is located the pilot's cockpit, which is entered through a door in the side. In this way the pilot has the engine under observation at all times, and another advantage of this location of the pilot is that the engine controls can be mounted directly on the engine and need not be disconnected when the engine is to be removed.

The fuselage is constructed of steel tubing, a system with which Fokker has been very successful. The passenger compartment is roomy and well fitted up. There are easy chairs for five passengers, of which three are fixed and two movable, all facing forward. There are three large windows in each side, two of which can be let down for ventilation. Besides a clock and an altimeter, the usual fittings of a high class limousine are provided. On regular air lines a map of the route and air photographs of towns and points of interest along the route may be fixed on the front wall. The cabin is entered by a full sized door two steps from the ground. Baggage space is provided between the back of the fixed seats and the rear wall of the cabin. Owing to the absence of a lower wing the view from the cabin is particularly free and unobstructed.

Fokker six-passenger limousine monoplane

Interior view of cabin

The wing is of the thick internally braced type; it has a span of 52 ft. 9 in. and is 25 in. thick at the center. It comprises two strong box spars to which solid three-ply ribs are secured with corner pieces. The whole wing is covered with three-ply wood, thus doing away with the rather perishable canvas covering. The calculated safety factor of the spars is said to be 7, but load tests have shown it to be even higher. The whole wing is fixed directly to the top of the body by means of four steel bolts which are calculated for a factor of safety of 14. Ailerons, elevators and rudder are balanced. The control cables for the ailerons are carried through the wings and the pulleys are accessible through inspection doors.

The weight of the machine empty is 2650 lb. and the load capacity is given as 1750 lb., which gives a very high useful load factor.

A neat arrangement is provided for the replenishment of the fuel supply. There is a hand pump located adjacent to the engine by means of which fuel can be pumped directly from the ground supply into the tank in the wing. This pump is fixed in position and is furnished with a length of gasoline hose.

## A New Electric Coupe

**A** NEW Detroit Electric, to be known as the Model 90, four-passenger coupe, has recently been brought out. It is considerably lighter than the brougham model which has been standard with this company for some time. The new car weighs 3385 lb. as compared with 3900 lb. for the brougham. The weight has not been removed from any particular part of the structure, but the car is lighter throughout, both in body and frame, resulting in a slightly higher maximum speed of 25 miles per hr., and a range per charge which has shown itself to be better than 75 miles in and around Detroit.

Three persons can be accommodated on the rear seat, and a fourth in a pullman seat in the right front corner. A removable seat, which is placed in the left front corner, can be used by a fifth person. The rear seat width is 49 in. and depth 18 in. The distance from the front to the rear window is 63½ in., and from the top of the cushions to the roof 38 in. The door opening is 24 in. The car is trimmed in whipcord with Turkish type of upholstery. The panels are painted either in Cobalt, dark blue with light blue stripes or Brewster green with light green stripes. The front and rear hoods, top, upper body structure and fenders are black. Wood wheels are painted

to match the panels. Wire wheels, when ordered, will be painted white, cream, red, blue or green.

The battery equipment is a Philadelphia Diamond grid, 42 cell, 13 plate. There are five speeds ranging as follows: 6, 10, 15, 20 and 25 miles per hr. The tires are Firestone pneumatic cord size 32 by 4 in. The equipment consists of two headlamps, two body parking lamps, one rear signal lamp, interior dome light, electric Klaxette horn, Hanlon rain vision shield, Warner speedometer, volt and ammeter, charging plug and tools.

## Utilizing Wood Waste and By-Products

**A** SYSTEMATIC survey to determine the possibilities of more complete utilization of by-products, low-grade material and wood waste has recently been undertaken by the newly reorganized Industrial Section of the Forest Products Laboratory at Madison, Wis.

An important part of the survey will include the location and development of new markets for material heretofore considered as waste or unsuitable for a particular branch of work. It is felt in many forestry circles that many wood-using industries are consuming valuable material for making various products in which a cheaper grade of wood could just as well be used. The service will include an exchange which is intended to bring producers and consumers in contact with each other in order to effect a more complete utilization of this material. The service of this exchange will be free to the public. It will include two reports, one on opportunities to buy waste and the other on opportunities to sell waste. The first will contain names and addresses of lumbermen and factories having such material to sell, together with a detailed description of the character, quality and quantity of such material. The other will contain names and addresses of factories in the market for wood waste and the sort of material they desire. With these reports will be furnished, from time to time, suggestions for new markets and new uses for waste material.

The Forest Products Laboratory will make a special study of wood-using industries with a view to determining to what extent cheaper grades of wood can be used in each particular field.

The new 4-passenger Detroit electric coupe

# Details of Body Design at the New York Salon

Close coupled bodies equipped with trunk racks at the rear feature most inside driven cars. The stationary windshield has become popular while devices on the shroud and top provide ventilation. The leather or fabric visor was also much in evidence. Disc wheel losing favor. Designs in the cars exhibited offer an indication of trend in future production work.

By George J. Mercer

**A**CAREFUL and thorough investigation of the motor car bodies exhibited at the New York Salon held last week, brings to light many features of interest to the men in the industry. The advances made in body design may be taken, in a certain sense, as an indication of the trend of designs that will later be used for manufacturers who build in large quantities.

As stated in a general survey of the salon in last week's issue of *AUTOMOTIVE INDUSTRIES*, there were about 60 bodies exhibited. This is not a large display, so far as numbers go, but it should be remembered that the salon represents the collective work of many of the best body style originators in the east. There were 13 body builders having space. Then, too, the industry has passed through a period of depression and this exhibition may mean much in the way of future business. Increased output is a universal desire and it can readily be seen that the best efforts have been put forward to make this show more distinctive than any that has been held for many years.

## Many Berlines Shown

The principal feature of this year's changes is the increased number of berlines. By this term is meant a body that has the appearance of a sedan but has a division between the rear and front seats, making it a two-compartment body. When the inside drive body was first introduced there was considerable hesitation on the part of manufacturers as to the number of doors and the necessity for having a division at the back of the driver. The small wheelbase car has been gradually evolved and its use does not permit such a division because the driver's seat extends too far back into the rear doorway. Consequently most sedan types have, in the past, been made with a single compartment. This show, however, demonstrates that the two-compartment body is required by many purchasers.

Another new feature was the enclosed drive cabriolet. This type of car is likely to be largely confined to the special body class of trade, since it does not lend itself to a production proposition as does the all metal body. As seen at the show it is a slight parody on its name, in that, while it has the appearance of being collapsible, in reality it has a permanent roof body. This body is an adaptation of the English body that has been used abroad for many years, but as shown now it has more practical use for the American market because the doors are full and there are less loose parts to rattle and get out of order than on a true collapsible type.

There is one advantage this type of body may have over other forms of enclosed cars in quantity production. Efforts are being made to get such jobs down to a minimum price and the use of fabric, which is used instead of leather or metal for the tops and sides is a step in that direction. Consequently if this high type of enclosed body can be produced cheaply the advance will be easier.

Another feature embodied in this type is the close coupled idea. The close coupled body has many advantages. It is more sociable; it brings the rear seat forward of the rear axle and therefore makes the riding easier; it makes a lighter body and offers a more pleasing appearance. There is a strong tendency to make bodies that are intended for only five passengers as short as convenient and thus take care of the wish of the owner to carry a trunk or suit cases at the rear. All the short bodies exhibited are fitted with these trunk racks. Their use to cover space left on the frame back of the body is sure to increase. It is the only way to provide carrying space at the rear that will give a well-balanced appearance. The lack of spare room in this section does not permit the use of a sensible looking luggage compartment, for length is necessary for such a design. A trunk rack, on the other hand, can be fitted over the short space and also extend over the gasoline tank. Several examples of the trunk rack are shown in the accompanying illustrations. One is made by the Fleetwood Body Company for Packard (Fig. 5), and another is by Winton (Fig. 3). The illustration of the lock body on a Mercedes phaeton (Fig. 2) shows the trunk attached. An interior of a Pease body on a Packard (Fig. 17) shows a provision made for carrying suit cases in the tonneau. This body, however, also has a trunk rack at the rear.

## Equipment and Interiors

As to the development of the interiors and appointments of inside driven cabriolets, the various makers have relied upon their individual tastes, as can be seen by the illustrations. Fleetwood presented one on the Lafayette (Fig. 27), with a slant front windshield. This is a gray painted job with a white stripe on the black moulding. The guards are also black. The equipment includes a leather visor and two-way windshield, the lower part being stationary. Ventilators are on the top and sides of the shroud and dash lamps are included in the equipment, as are dome and corner reading lamps. Seat pillows and foot cushions are provided and vanity cases are at the rear of the front seat. This location of

Fig. 1—Brewster berline showing new construction in which fabric panels are used for back and quarter. Fig. 2—The trunk rack and cover and method of fastening on a Mercedes. Fig. 3—Trunk carrying arrangement on a Winton close coupled sedan. Fig. 4—Daniels cabriolet showing joint covered with flap. Fig. 5—A protecting device for trunk and trunk rack on a Fleetwood-Packard cabriolet

these latter articles is an improvement over the side position. The robe rail is directly below these vanity cases. The interior is trimmed with gray granite weave worsted fabric. The doors are trimmed plain and the seats and backs with straight pleat.

The Smith-Springfield body on a Rolls-Royce (Fig. 23) is an example of the straight front style. This is a gray body with a black stripe and two hairline gold stripes. A ventilator is on the shroud and the trimming is in gray Bedford cord.

The Murphy body on the Lincoln (Fig. 25) offers an example of the extremely close coupled body of the same class. This body is painted tango with black mouldings. The trimming material is wool velour of tango color and this model also has the vanity cases at the rear of the front seat. Cycle guards and steps are a part of the equipment. The illustration shows the car with both doors open and the close coupled effect is self-evident.

Two other types illustrated are Healey bodies; one on a Pierce-Arrow and the other on a Falcon (Figs. 7 and 26). The first is a two-door body, although Healey also builds four-door models. These bodies represent an exclusively new feature in door pillars and front corner

pillars. Close-up views of the four-door body show this feature more clearly.

The first body is painted in two-tone green, the lower part being similar to sea green and the upper much darker with close double white stripes. Spanish green leather is used for trimming and the roof is skeleton lined. The top of the seats and border wood is circassian walnut. This wood has been used largely for interior door handles and the casing for the curtain roller on this model is made of the same material.

The Falcon body is an unusually light and close coupled body and was the lightest and lowest car at the show. It is painted green with black mouldings and upper part.

The illustration of the rear view of the Brewster berline (Fig. 1) shows that the use of fabric is becoming established as a body panel material. Here the rear, side quarters and the roof are so covered. This fabric is secured under mouldings that are put on after the job is painted and the wood screws show plainly. This method detracts from the appearance and in time other and better means for fastening the fabric will be devised. This will be necessary as fabric is to be gener-

## Features of Some New Models Exhibited

Figs. 6 and 7—Healey-Pierce Arrow two door inside driven cabriolet showing small front pillars. Fig. 8—Lincoln inside driven cabriolet showing ventilator on shroud and leather visor. Fig. 9—Fleetwood-Lincoln berline. Fig. 10—Healey-Stevens Duryea inside driven cabriolet showing rear seat divided. Fig. 13—Murphy-Lincoln close coupled phaeton showing novel side windshield. Fig. 14—Smith-Springfield-Minerva coupe exterior with Brewster windshield. Fig. 15—Smith-Springfield-Minerva coupe showing seating arrangement

ally used for panels. The body on this car is painted a bronze green with black mouldings and white stripes. The illustration shows handles, hinges, windshield and trunk rack. The interior is skeleton above the waist line and the fabric of the rear and the quarter panels is exposed on the outside. This gives the body an extremely light look and is no doubt the forerunner of other bodies using the same idea. The interior trimming is a gray wool texture with brown pin stripe. The trimming is in plain pleats and buttons to maintain the shape on cushions and backs. The use of buttons was quite general on other makes of bodies. It is an improvement over the plain pleat and it permits the natural shaping of the cushion and back to the position of the body. It is more expensive, however, and can be used only on high grade bodies. The body also has ventilators on the top of the shroud and two in the roof. Arm rests on the rear seat enclose the vanity cases and dictaphone. A dome light is located at the top rear above the back light. The front compartment is trimmed in leather. Pipe and point design is used and the doors and body pillars above the waist are skeleton.

#### Use of Visor General

The use of a fabric or leather visor was general among the models exhibited. There was not a single car at the salon having a colored or frosted glass visor. There were a few with the three-way shield with plain glass, but the majority used either fabric or leather over sheet metal or a frame. The illustrations show two examples of this, one on a Lincoln (Fig. 8) and the other on a Pierce-Arrow (Fig. 6). This type of visor has been seen about for popularity since its advent about three years ago. According to the use made by exhibitors this year indications point to a more general use of the material. It can be made for less money and lessens the glass cost in a three-way shield, hence its adoption presents no obstacles. In this connection it should be mentioned that the average extension of the roof beyond the front of the body tended to be short. The Lincoln was one of the longest on exhibit. It might also be mentioned in passing that the sloping windshield was used exclusively on all berlines. Last year the straight front was leading on all enclosed bodies, but this year the reverse is true.

Windshields on both open and enclosed bodies had the lower part stationary and all made use of the ventilator on the shroud. New features on windshields were not much in evidence, Healey having the only radical departure from customary designs. This is shown in a close-up view of their body on a Pierce-Arrow (Fig. 12). The position of the hand serves to illustrate how the glass is operated by turning the handle which raises and lowers the glass perpendicularly. The Brewster windshield has been used on several bodies other than their own.

A new form of side wing for open bodies is shown in the illustration of the Murphy in Fig. 13. The frame work of this is of wood and is somewhat bulky, but the side wing feature is good.

The operation of raising and lowering the door glass has been brought about in a new way by Healey, as shown in Fig. 6. This method is used by the builder on several bodies. On the one shown the top is collapsible and the channel slides with the glass, but on bodies with permanent tops the channel is stationary and the glass alone slides in the groove upon the same principle that the regulation door glass is operated. The advantage of this feature lies in the fact that the body pillar can be made lighter as will be seen from the illustration.

The exhibits, from the viewpoint of uniformity, showed,

on an average, a set that gives a fair indication of the future trend in design. This is true of both exterior and interior. For example, the larger part of the cars have nicked radiators, larger headlights of circular design, and these for the most part are nickel finish. The windshields were often thus finished and the general exterior appearance is brighter. Of course the color scheme at the show is not much of an indication as to the general trend, as show cars are usually dressed up for the occasion. Still there were no loud color schemes. Grays, soft greens and brown with red or maroon finish were popular. In nearly all cases striping was the rule. Much of the brightness at the salon seemed to be brought out by the use of nickel parts. In this connection the use of dash lamps was quite common and sometimes these were larger than the conventional bull's-eye type.

The shapes of the radiators reflected little that is new. Most of them, except those of foreign makes, are of standard design. However, if any indication may be gleaned from the combination of body and hood lines, the use of rounded lines will be the rule. Some few bodies have square rear corners, but not enough to show any leaning in this direction. There was an indication of the resurrection of some of the older forms of appointments, such as pillar lamps on broughams, loop handles on the doors and tee moulding. It would be difficult to say whether the use of mouldings has lost or gained. There were more bodies with mouldings at the bottom than last year and there was the usual proportion with flush doors. Holbrook brought out an innovation in making use of the recessed panel effect on both open and closed bodies. This panel separates the upper and lower body and is painted a contrasting color. On the open body this panel effect is continued through the hood to the back of the radiator, thus giving the long straight line effect that is sometimes attained by the bevel edge or moulding. The bevel edge was shown on but two cars at the salon and this in a modified form on the fore part of town car bodies.

#### Soft Roof Makes Gains

The soft roof made rapid gains this year. There were not more than two bodies in the show that had solid roofs. Some of the bodies have metal covering over the corners and the soft panel in the center. The skeleton roof was shown in several cases and with splendid effect. It gives a light appearance to the interior and is suitable for an all year body.

The use of the enclosed rear quarter has increased considerably. It is not to be expected, however, that the use of this type will become popular with the general public. It does, however, indicate the use of smaller rear quarter windows on close coupled bodies and it is believed this practice will become more general in production work. Some of the cabriolets shown have very small back windows. This is permissible for chauffeur-driven cars of the town car type where the driver is outside, but for utility and safety the large back window has an advantage.

Ventilators are the rule on all cars. As was stated before the stationary lower part of the windshield as used at the show necessitates the use of the shroud ventilator. This is generally used at both the top and sides of the shroud. The use of a ventilator in the roof was also quite common and is a necessity when the rear quarter is without a window as many of the new designs are made. In fact, increased use of the roof ventilator may be looked forward to. It has a decided advantage in ventilating and increasing the comfort of the car.

From the illustrations shown, and the tendency indicated that bodies with fabric sides will increase, the ap-

## Interior Features at the Salon

Fig. 16—Brewster cabriolet, showing interior trimmings. Fig. 17—Pease-Packard phaeton, showing arrangement of suit cases in tonneau. Fig. 18—Fiat inside driven two-door body, showing operation of folding seat. Fig. 19—Holbrook-Packard phaeton, showing trimming and wood bows of top. Fig. 20—Brooks Ostruk-Minerva cabriolet. Notice the natural wood finished interior. Fig. 21—Interior finish and seating of a Daniels cabriolet. Fig. 22—Rear interior of a Murphy close coupled phaeton

pearance of the roof will be thicker as viewed from the outside, because the corners will be more rounded to carry out the cabriolet effect that has been the parent of this new design.

The use of steps in place of running boards did not show any gain over other years. In fact indications are that the running board will hold its own because it shows a defined line that helps to emphasize the length of the car. At any rate the attitude of those who exhibited would indicate that the idea of replacing the running boards with steps had not met with much favor.

The mudguards that showed to the best advantage and those most in evidence, were the full crown shape, the rear following the contour of the wheel and well down at the back with a slight reverse curve and the front quite long before connecting with the running board.

#### Disk Wheel Losing Favor

The disk wheel did not have many devotees. Wire wheels were used to a considerable extent, and these, with the spoke wheel, made up the bulk of those shown. The carrying of the extra tire or wheel was fairly divided between the rear portion and on the side at the front. This does not mean much to the average car builder, because there has always been the proportion of cars in the larger cities that use the front position. The utility of the rear position, however, is well established for the majority of car users.

The correct method of hinging the doors on closed bodies does not seem to have been certified as yet. Doors were made to open in all ways possible. The safest way is to hinge them at the front, as most phaetons are made, but there is dissatisfaction with this method on the part of many as it is inconvenient for entrance or exit. Then, too, at times there is more or less mud on the rear guards and for this reason the door is best hinged at the back so that the handles of the two doors come together. This is illustrated in the picture of the Murphy inside driven cabriolet (Fig. 10).

Both the two and four-door variety of inside drive bodies were in evidence, but by far the larger number used the four-door model. Traffic on one way streets compels passengers to alight from the left side if they wish to alight on the left sidewalk. This is having its effect in bringing into favor the four-door body, therefore the close coupled body of this type is looked forward to by many as the body that will supersede the coupe. There was only one body of this miniature sedan shown. There was also but one coupe shown and there were only three conventional type sedans on exhibition. There were several two-door inside drive five-passenger bodies and one illustration of a Fiat (Fig. 18), shows the arrangement of swinging the seat to allow entrance to the rear while the Minerva (Fig. 15) shows the conventional coupe with hinged front seat and large entrance way.

#### Interior Trimmings

The interior hardware showed harmony in design and the dull silver finish prevailed. The dome light was the rule and this was placed in the center. For two compartment bodies one light was used on both compartments. Corner reading lamps have come back. In fact there was almost an ostentatious display of all that ever belonged in a body except the arm holders, and even these have come back to the extent that toggle grips were used in many cases. All the articles in this display have a use and they are of rich design and appropriate, but their arrangement was often such that their presence was exaggerated. For instance, grouped close together on many of the bodies, would be a natural wood

vanity case with silver contents, a silver telephone, a regulator handle and a pull to handle, all of silver finish. Some bodies had arrangements that made these less conspicuous by different grouping. As an example, on the close coupled bodies, the vanity and smokers set were arranged on the rear of the front seat. Then, too, the inconspicuous telephone or dictaphone helped in this way. Brewster used the front end of the arm rest to contain these while Healey made use of a natural wood locker to contain them.

The hardware on one body is of very sombre shade and this helps to minimize the appearance of too lavish display of jewelry. Healey has the handles and many of the parts circassian walnut with silver finish. The use of highly polished natural wood finish mouldings around the windows in place of the dull finish helped to improve the interior harmony.

A few of the bodies were finished with natural wood panels and strips similar to the custom in use several years ago. Four illustrations of this are shown. The Brooks-Ostruk (Fig. 20) shows the entire door panel; the Daniels (Fig. 21) shows strips on the doors and the two Healey bodies on Pierce-Arrows show circassian walnut trim on top of the seats and forming the arm-chair effect. This last was the most harmonious because it showed no sharp contrasts.

The dictaphone was placed on many of the bodies in an incorrect position, in that it was not convenient to make use of the instrument without bending one's body in a very uncomfortable position. It should be high enough and far enough forward so that when the hand is used to press the button the elbow will not cover the plate and virtually prevent its free use.

#### Fabrics Similar to Last Year

The fabrics used for the interior trimming of the closed bodies is the continuation of an idea started last year. Velour was used on only one body and partially used on one other. All the others used cloths with the exception of a few using leather. This latter was customary for trimming the front compartment of two compartment bodies. It is rarely used for the rear compartment as it is too cold. The predominating material was wool fabric. The color gray predominated with often a pin stripe of darker shade. Other shades were used, but they are few in number and the texture also was slightly different. The majority have the regulation short nap, but some using wool velour had the long nap that goes with this material. Broadcloths were also used to some extent as were Bedford cords and a few used a new material that has come out for this purpose called a granite weave worsted. The illustrations shown demonstrate the style of trimming. The interior of the Brewster cabriolet (Fig. 16) shows a plain pleat with buttons and the cushion made more like the old carriage cushion. The arm rests on most of the bodies have a pocket under them which is used as the receptacle for the telephone when not in use. The Brooks-Ostruk (Fig. 20) is also the interior of a cabriolet and shows pillows on top of the cushions, as well as the pillow at the back. Pillows were evident on many cars, one generally being placed in the corner and foot cushions were also general. The two views of the Healey show this body trimmed plain. The rear seat view also shows the locker in which the vanity case is stored and the shape of the foot cushions. The side lamps and the skeleton roof are also depicted and the view of the front seat shows in addition the narrow front pillar construction, the divided windshield and the side lamps.

As a rule all doors were trimmed plain and no welt used. At times a cord welt was used and some had a

Fig. 23—Smith-Springfield-Rolls-Royce inside driven cabriolet. Fig. 24—Fleetwood-Flat brougham. Fig. 25—Murphy-Lincoln inside driven close coupled cabriolet showing interior and arrangement of vanity cases. Fig. 26—Healey-Falcon two door inside driven cabriolet with quarter window. Fig. 27—Fleetwood-Lafayette inside driven cabriolet

carpet line at bottom. Manufacturers who are showing new samples of cloths are also displaying narrow lace, anticipating that this will come back into favor.

As to styles on trimming, there is a tendency to use buttons to some extent with a pleat to shape the seat cushion and back. There were a few bodies that showed the pipe and point design, but in all cases the appearance was always in evidence of a very soft, flexible cushion and back rather low as compared to former years. The look sought by all is to keep the car down and this can only be obtained by minimizing the interior sizes.

The open bodies included a Holbrook on a Packard (Fig. 19). This body has the recessed panel all the way round the back and to the radiator. The interior seating shows plain trim design, while that of the Murphy body (Fig. 22) shows the pleat. This latter illustration also shows the close coupled body and deep cushion and wood trim on the top edge of the seat. However, as shown, the height for the back is not sufficient for comfort, although the trim as shown makes a clean cut design. Both these pictures show the top to some extent. Wood bows natural finish and nicked slat irons are used on nearly all tops. The fabric used is light in color and European custom has been followed on this part of the body. Foot rests are generally used as well as robe rails on all open bodies. The windshields on these bodies

have stationary lower part and nicked shields are popular.

Flush doors are the rule on open bodies. The future name for this type of body will be phaeton. The name "touring body" has lost its application as indicating the open body and the standards committee of the Society of Automotive Engineers have decided to adopt what is a more universal name, phaeton.

Roadsters were confined to one. This was exhibited on the main floor on the Richelieu chassis and was a large body for its class and had a seat outside the body on the right side and the step for entrance had an extra pad that provided foot room for the occupant. Cycle guards and steps were used.

**A**N engine bearing with large radiating flanges to help carry off the frictional heat has been placed on the market by the Bearing Engineering Syndicate. The bearings are similar in shape to regular bearings, but are provided with radiating flanges at both ends, which extend parallel with the crank arms. While the ordinary bearing is supported by the metal of the crankcase wall or its partitions, oil is likely to get into the joints and prevent the ready conduction of heat. It is claimed that as a result of the better heat radiating facilities the Radiated Bearing will last longer than an ordinary bearing.

# Engineering Features of Salon

By P. M. Heldt

**F**ROM a technical standpoint we never look for very much at the Automobile Salon that is entirely new.

Coming as it does directly after the great foreign shows, whatever there is of recent development among the foreign chassis has been exhibited at one or the other of these shows and has been covered by reports on them by our foreign correspondents. Leading American car makers, even though they may exhibit at the Salon, would hardly select that exhibition of comparatively narrow appeal to present any radically new designs. Novelties would be expected only from those manufacturers who cater chiefly to that select clientèle for whose benefit the Salon is held.

The one car to make its first appearance at the Salon was the Richelieu, a new assembled product from Asbury Park, N. J. It is typical of a class of car of which there are already several on the American market, having a powerful four-cylinder engine, a sporty type of body and high-class equipment. The engine is a Rochester Duesenberg four-cylinder  $4\frac{1}{4}$  by 6 in., 85 hp. Other parts and equipment include a Brown-Lipe clutch and transmission, Standard Parts front and rear axles, a Gemmer steering gear, Bosch magneto, Westinghouse electric equipment, Hartford shock absorbers, Romon lubricator, Fleetwood body and Houck wheels. The car has a 130-in. wheelbase and is made for the present in three and four-passenger open types.

## Unit Power Plants on Foreign Chassis

Looking over the foreign chassis at the Salon one is impressed with the fact—pointed out at once by our foreign correspondents—that European design tends strongly in the direction of rear axles with torque tubes, with either a forked or spherical connection to the transmission case at the forward end. The spherical connection apparently is much more prevalent than the other. At the same time Continental manufacturers have gone in quite strongly for unit power plant construction with three-point support. As many of them are using four-speed gearsets which overhang the engine supports on the flywheel bell housing a considerable distance, which supports are generally more or less hidden by the dashboard, and as the torque tube extends directly from the rear end of the overhanging transmission without any support from the frame at that point, this gives a chassis of unusual though very clean-cut appearance.

There are two eight cylinder-in-line engines at the Salon, the Duesenberg, which was fully described in a recent issue of *AUTOMOTIVE INDUSTRIES*, and the Isotta Fraschini. Both of these are chassis of exceedingly trim lines. The Isotta has a wheelbase of 146 in., which is probably the longest wheelbase passenger car that has ever been built. This car has a lock on the transmission. There are three finger levers on the steering wheel, for the spark advance, the throttle and the mixture adjustment respectively. All three are of the same design and are spaced evenly in a circle, but their uses are plainly marked on them. Many features are notable on this chassis that are adopted in the interest of clean chassis lines, for which Italian cars are so noted. Thus the timing shaft for the ignition distributor passes through the crankcase from one side of the engine to the other. The high tension ignition cables from the distributor do not extend directly to the spark plugs, but pass through an inclosed space at the side of the engine, so that the visible portions are com-

paratively short. The front springs are held to the axle by pressure plates which have four threaded studs forged integral with them. The rear underslung semi-elliptic springs are held to loose collars on the axle housing by U-bolts or saddle bolts for which saddles are forged on the collar, one in front and one in the rear of the axle housing. This is contrary to the usual practice where saddle bolts are used, where they are made to straddle the axle housing itself.

## Two Carbureters on Multi-Cylinder Engines

A new six-cylinder model of Benz car is shown. In this, as in the Isotta eight-in-line, there are two carbureters. The cylinders of the Benz six are cast in two blocks and each block has its carbureter bolted directly to it, on the side opposite from the inlet valves, the inlet passage extending through the cylinder block. There is a tire pump on the cam gear housing. The Robert Bosch electric system is fitted to this car. In this the starter motor is engaged with the flywheel gear ring by means of a sliding armature under the influence of the magnetic pull of the field frame, relative to which the armature is axially displaced by a spring. This is the system originally developed by Rushmore, whose plant and business was bought by Bosch about eight years ago. In order to avoid possible injury to the flywheel gear ring from the clashing action of the gears, the starter pinion is made of hard bronze and of comparatively small dimensions, so that its teeth are weaker than those of the driven gear and would break first in case of abnormal stress. This pinion is a cheap part and can be quickly replaced.

On the Benz the transmission, which is a four-speed unit, is mounted amidships, between two cross members of the frame. The cross shaft of the brake linkage with the equalizing mechanism is inclosed in the gear box, which tends to make the chassis layout cleaner. There is also a neat feature on the circulation pump. The inlet and outlet to the pump are in the form of a single casting of T shape, mainly above the pump proper. To the horizontal sections of the T the hose connections to the radiator and jacket are secured, bringing these two connections in line and making it appear as though the water passed from the radiator directly to the engine jacket. The Vee fronted radiator has led to the adoption of a rather peculiar-shaped fan. This fan is quite small, the large size of the radiator making much assistance from the fan unnecessary. It would seem that in the design of this Benz an attempt had been made to meet somewhat contrary requirements, namely, large size of car and economy in fuel consumption and upkeep, for the engine is very small in comparison with the space provided in which to lodge it.

Since the cars at the Salon are representative of the high grade product of the automobile industry, it is interesting to note the type of wheels on the models exhibited. Wood wheels are in the lead, but wire wheels follow closely, while the disk and pressed steel spoked types are used on a few models only. A rather remarkable feature is the strong representation of wire wheels, these being fitted on the following makes of cars: Benz, Isotta, Minerva, Hispano, Rolls-Royce, Cunningham, Winton, Lanchester, Daniels, Baker electric, Duesenberg, Rochambeau and Richelieu. Some exhibitors, like Winton and Daniels, show models with two or three different types of wheels.

# Marketing the Motorcycle

## Part II

Some phases of motorcycle selling are common throughout the industry. Others are individual to specific companies. The general phases are discussed in this second article. A broad vision of marketing, proper dealer organizations and co-operative research are among the topics treated.

By Norman G. Shidle

**M**ETHODS have been discussed regarding the determining of the potential fields for motorcycles in a given territory. When this has been done as accurately as possible, in view of the statistical and economic data available, the problem remains of actually selling machines to the largest possible number of those who comprise that possible market. Under present conditions it may as well be admitted that this possible market is not identical with the immediate probable market. Moreover, the total immediate probable market as a whole is not the immediate probable market for every individual motorcycle manufacturer.

The problem of the individual manufacturer, then, is to determine what part of that entire market constitutes a possible market for his type of machine and the proportion of that section of the entire market which he can hope to sell. It is scarcely sensible for any single manufacturer to expect to sell 100 per cent of the possible market in his class and to build up his production and sales organization accordingly.

These detailed factors can be determined only by a study of individual production and sales statistics, however, and are not included in the field of these articles.

There are certain general factors in regard to selling, however, which would appear to apply throughout the motorcycle field. Some of these have been discussed before, but they are so fundamental as to warrant repetition in considering the general problems of marketing the motorcycle.

The chief factors in motorcycle merchandising at present, perhaps, are as follows:

1. The dealer organization
2. The relationships of local rival dealers
3. The relationships of rival manufacturers
4. The human and psychological factors of the market
5. Relation of temporary actions to permanent progress

At the recent motorcycle show in Chicago motorcycle manufacturers are reported as showing more interest in dealers and prospective dealers than ever before. During the last few years, when demand exceeded supply, only large city dealers were supplied. Small town dealers were entirely neglected, with the natural result that these small town dealers are not responding very enthusiastically when called upon at the present time.

Manufacturers in general are apparently convinced of the ill effect of the current misuse of the motorcycle and, in establishing new dealer contacts, this factor is being considered. A definite effort will probably be made to establish the motorcycle socially.

The one new vehicle exhibited at the show is interesting from this marketing as well as from a mechanical point of view. Reports indicate that this new automobile-built motorcycle is to be sold on a basis definitely different from that of other motorcycles. It is to be sold as a utility transportation vehicle. Its speed is limited to 35 miles per hour. The following statement, made by

the publicity agents for this vehicle, is also of interest: "There have already been enough inquiries from automobile dealers to indicate that the logical sales outlet is through the automobile dealer."

This will be an interesting experiment. Some other motorcycle companies, as a matter of fact, are reported to be signing contracts with automobile dealers in small towns.

They believe that it is likely their equipment will have to be sold from the transportation shop in the small town. All these developments indicate the vital dealer problems which are properly concerning the motorcycle manufacturers at present.

The dealer is the contact point with the public, and he is largely instrumental in molding public opinion of the motorcycle, regardless of publicity efforts of the manufacturer direct to the buyer. Thus the dealer organization assumes a peculiar importance in the motorcycle marketing scheme.

In another sense the dealer organization must be carefully considered from the standpoint of the individual manufacturer. There is a distinct difference in the potential market of the big power motorcycle and the middle-weight and light-weight machines. A manufacturer may be better off temporarily without any distribution in a given territory than to have his product in the hands of a dealer not thoroughly sold on his type of machine.

The type of dealer is important, therefore, from the standpoint of the selling appeal of the particular vehicle. The large majority of dealers in the motorcycle business to-day are thoroughly sold on the high-powered, speedy

motorcycle. This group comprises those dealers who have been in the business for many years, who know all the race riders by their first names, who follow racing records closely, who like the thrills of high-speed driving themselves, and who are capable of selling this type of vehicle to the limited group with similar interests.

In this group of dealers are some high-grade business men, who have visualized the utility possibilities of these big machines and who see the possibility of an expanding market through a promotion of the less dangerous and more enjoyable sporting phases of the motorcycle. This section of the high-powered dealer group is not in the majority at present. The type of man is readily recognized, however, and he is probably capable of developing the field of this type of vehicle to its ultimate extent—which is probably a little wider than that known by total motorcycle sales in the past.

In other words, the best type of dealer now in the business should probably be called upon to sell the high-powered machine. The dirty, unintelligent type of dealer should be eliminated from every kind of motorcycle selling. The best type of dealer, just referred to, is capable of selling everyone that the uncleanly, low-grade dealer sells to—and he can sell to many others besides. The low-grade dealer, through his influence and methods, increases sales resistance to motorcycles in general to a greater extent than any other single factor.

One of the metropolitan dealers of a high-powered machine, for instance, has a shop which is so filthy, so dark and so unpleasant in every way that no self-respecting man would venture into it under any circumstances. Fortunately for the manufacturer involved, the methods of display used by this dealer are so bad that it is difficult to determine what business he is in.

It appears, then, that the majority of dealers now in the motorcycle business are those who have sold the high-powered machine for years and who are "sold" on that type of vehicle. Many of this group are definitely the type of men who do the industry more harm than good. The higher type of dealer now in business, however, must be multiplied. He is capable of marketing the high-powered machine efficiently and of giving it the widest distribution possible.

The education of these dealers must, of course, go on. But manufacturers will do well to estimate carefully where the possibilities of such education begin and end in the case of each dealer. Education implies some basis of starting. There are many dealers selling motorcycles to-day who can never be sufficiently educated to make them a profitable investment from the standpoint of ultimate sales expansion. Not only the actual sales of the individual dealer must be considered, but also his effect upon the motorcycle market in general. This is peculiarly true of the motorcycle, as noted before, because of the prejudice against it which exists so widely. The high-type dealer of this group, moreover, who either exists or can be developed, will relegate to its proper limited importance the matter of racing and race records.

The racing deaths of recent months have probably done more to strengthen the prejudice against the motorcycle than many thousands of dollars spent in propaganda work could hope to overcome. The general public

is interested in the news items describing the death of riders. It is not at all interested in the technical discussions of racing rules and M. A. T. A. regulations which follow such events.

Motorcycle marketing should be visualized as a whole. The prime purpose of the manufacturers and dealers is to sell more motorcycles. Racing has a small part to play in this broad scheme of progress. In tracing the benefits which apparently accrue from racing, manufacturers should consider as well the vast sales resistance which is caused and strengthened by this same means. If an accurate analysis and balance were possible, it is very doubtful as to which side of the scale would weigh down.

Manufacturers sometimes plead that they would like to curtail racing expenditures and the emphasis which has been placed upon racing, but that they cannot do so because their dealers would not permit it. Dealers of this kind are not maximum motorcycle sellers. The dealer whose view of the merchandising problem is so thwarted by the racing bug that he considers it of major importance, will not develop maximum sales in his territory. It is encouraging to note this statement in a recent issue of a motorcycle paper: "It is in the air that factory-promoted races will end with 1921."

The high-type dealer, many of whom are already connected with various manufacturing organizations, would promote other sport events for the big motorcycle which would not only be less dangerous, but would interest more people and which would bring the motorcycle before the public in a favorable light. The details of these phases need not be discussed here, since they

are thoroughly understood by men within the motorcycle industry.

### The Light Motorcycle

The light motorcycle, however, presents a distinct marketing problem. A majority of the dealers selling motorcycles to-day are thoroughly "sold" on the high-powered type; this is true even of the high-type dealer about whom we have been talking. That there is a definite field for vehicles of this kind and for dealers of this kind is not to be doubted. Past and present sales and statistics prove that. They also prove, however, that there is a definite limit to the number of such machines that can be sold; that these limits are already close enough to be defined in a general way. This does not mean that such motorcycles cannot be profitably made. It does mean, however, that the annual sales curve for this type of vehicle has almost reached the point of permanently straightening out.

Thus if the lighter motorcycles are to attain a numerical development similar to or greater than that already achieved by the big machines, they must sell their product to a different class and type of buyers than those to which the big machine appeals. In other words, so far as the ideals of the present majority class of dealers and buyers is concerned, the big machine is superior to the small machine in every way.

There are other types of buyers, however, with different ideals and different purposes, who may be

---

**H**ERE is a statement from within the motorcycle industry:

"We strive to reach a field of dignified, clean-cut riders. To do so we educate them in terms of exalted speed and daredevil exploits of track burners. We bemoan the presence of public disfavor and to remove it we increase the burden by eternally shouting Speed, Speed, and more Speed.

"The almighty dollar is so close to the nose of some that it blocks the view of the great heap of dollars that lie just beyond the narrow field of prospects developed by racing."

---

sold on the light motorcycle if approached in the right way. This can be accomplished only by a dealer organization which is thoroughly sold on the field and possibilities of the light motorcycle. The usual motorcycle dealer handling a light machine, in addition to a heavy machine, is not likely to do the latter justice.

An example of this occurred recently when a man interested in a light individual transportation vehicle went into a dealer's shop. This dealer handles about twelve different types of motorcycles, ranging all the way from one which will go over 80 miles an hour down to small machines which are little more than bicycles with a motor attachment.

The customer indicated his interest in one of the lighter machines and desired to have his convictions concerning their performance and possibilities strengthened. He was not very strong for motorcycles in general, since he had imbibed much of the popular prejudice; but he was rather interested in a light vehicle, not costing too much, which would take him back and forth from work.

The salesman met this customer's approach by stating that the light machine might do for some people, but said in a rather disparaging tone of voice that it really wasn't much of a machine, anyhow. He indicated that anybody with any red blood in his veins would want one of the big, powerful machines which he himself rode. He then proceeded to relate great speed records which he had made on such a big machine himself, and told much of the power accomplishments, etc.

He finally indicated that he would, of course, be willing to sell one of the lighter machines if anyone insisted upon it. Nevertheless, the customer gathered that this particular salesman, at least, would rather look upon anyone who actually preferred such a machine as something of a "nut" or curiosity.

While perhaps not so marked in every case, this attitude is somewhat typical of the average motorcycle dealer of to-day. The light motorcycle cannot be competently handled by such men, regardless of their business ability, their well-kept salesrooms and their selling achievements.

It would seem that an entirely new dealer personnel might have to be developed; this new group of dealers to sell to an almost new group of buyers. The growth along this line would of necessity be very slow. A new idea and new methods cannot be expected to mature over night. Moreover, the light motorcycle will continue to suffer with the big one the public prejudice which exists against the motorcycle in general, and will thus have additional difficulties to overcome.

Some manufacturers of lighter vehicles, however, already have come to this conclusion and are starting on the road to permanent progress. It is perfectly possible that the road will be longer to increased sales, but once the upward swing is started there would seem to be far greater ultimate possibilities than have thus far developed in the high-powered vehicle market.

#### Co-operative Action

There are certain problems, however, which the motorcycle industry faces as a whole. These problems must be met co-operatively. A big vision of the possible development of the motorcycle in America must be substituted for all attempts to gain small and temporary advantages. A sincere spirit of co-operation among all manufacturers and a definite effort to face constructively the problems confronting the industry might mean thousands of dollars in the pocket of every individual firm within the next 10 years.

Such co-operation would involve the exchange of intimate information and the development of constructive marketing research. The difficulties of the individual manufacturer at the present time do not really lie in the competition of other manufacturers, but in the overwhelming prejudice existing against all motorcycles, in the limited uses to which the motorcycle has been put in most cases and in the lack of accurate marketing analyses.

In carrying out co-operative efforts all agencies within the industry might do well to examine these more fundamental factors in an attempt to determine some real facts upon which to base progressive development. These things are vital to the industry and are more important than questions as to whether or not anyone should be allowed to participate in an M. A. T. A. run unless he is a registered member. There are fundamental problems facing the motorcycle industry. Most of them are such as call for co-operative, constructive thought and action at the present time.

None outside the industry is capable of solving or even of visualizing these problems completely. It is the task of the men within the industry and can be accomplished only by them. A frank discussion of these problems among the various manufacturers would soon result in a concrete visualization of the actual problems. This would be followed by constructive research and finally by the determination of methods of progressive procedure which would largely benefit all concerned.

#### Getting Co-operation Across to the Dealers

This idea of honest-to-goodness co-operation must be instilled into the dealers—or dealers should be obtained with a broad enough vision of marketing to push the idea on their own account. It is reported that motorcycle dealer associations in the past have frequently been little more than criticism parties, and that they have frequently broken up on account of the ill feeling generated by the meetings.

The chief necessity facing the motorcycle industry to-day is that of selling the public on the motorcycle as a vehicle. While each manufacturer and dealer, of course, is immediately interested in selling his own machine, the motorcycle in general must be sold first. If this were successfully accomplished there would be increased business for every manufacturer and dealer in the business. Until it is achieved, sales and production will be limited to the old customers.

The dealer who spends his time knocking other motorcycles in an attempt to convince the public of the superiority of his own machine is definitely piling up future sales resistance for himself as well as for other dealers. The dealer who lacks enough constructive vision to co-operate with other dealers sincerely and broad-mindedly in the promotion of the motorcycle idea has no place in the motorcycle selling scheme of the future.

The vision of a broad merchandising policy for the motorcycle as a vehicle is necessary throughout the industry, throughout its publicity, its sales methods and its thought and discussion, within and without its own borders. Thus may real progress be made toward an increased and constantly broadening market.

There is sometimes too great a tendency to concentrate attention upon traditional problems and traditional interests. The matters discussed at meetings have a tendency to rotate about small points of interest to no one not intimately connected with the industry.

Available statistics concerning the motorcycle industry show few encouraging signs, viewed over a period of some 10 or 12 years. There is no steady commercial growth shown by the industry as a whole to parallel the progress in mechanical and engineering phases during the same period. There have been many ups and downs in both domestic and foreign trade; the figures show a series of abnormal conditions, each one of which affects sales.

A close analysis of these trends, made by those thoroughly familiar with all branches of the industry, might reveal the causes underlying the lack of apparent progress. On the basis of such an analysis, intelligent discussion might proceed as to how the difficulties might be remedied.

These things cannot come about, however, until the industry and its important marketing problems are viewed in a big, broad way and from a scientific and analytical point of view. Such studies would include an analysis of the human and psychological factors which affect the buying of motorcycles. This would not simply be the offhand opinion of a group of men, but sincere, detailed study designed to find out as much as

possible about these variable factors. Many of these factors are apparent, but little constructive effort has actually been made to meet even the obvious difficulties arising from the psychological state of the general public toward the motorcycle.

Were the intense interest and constructive thought of the various agencies within the industry focused upon these problems great progress would be made within a few years. In one sense the vision of the motorcycle industry as regards its marketing problem appears to be out of focus. The position of the lens needs to be shifted.

The necessity for immediate sales must, of course, be recognized. It is not always possible to go directly toward an ideal condition. But until some careful analysis reveals the actual possibilities and probable scope of development in some definite fashion, there are few standards by which to direct temporary actions at all. A clear analysis of all the factors affecting motorcycle marketing, an attempt to properly correlate these factors and a concrete visualization of the fundamental problems confronting manufacturers in developing new markets would go far toward giving impetus to future sales.

## Magnetically-Controlled Tapping Machine

THE tapping machine illustrated herewith carries the tap in a floating spindle, which is driven by two cushion springs, the object being to eliminate shocks and jars on the tap. The machine embodies an automatic oscillating feature which is controlled electromagnetically. By this oscillating feature hand-tapping is imitated, but the limit of strain placed upon the tap is controlled much more accurately, being fixed by the tension to which the spring is set.

Should the tap hit bottom, a tight hole or any other

obstruction which places a greater strain upon it than that for which the dial is set, the machine will reverse automatically, move backward one-sixth of a revolution, thus freeing the tap, and then reverse again. This oscillation continues until the obstruction has been over-

Gaterman  
electro-magnetic  
tapping machine

Adjusting device with  
dial for varying maxi-  
mum strain on tap

come. In ordinary tapping, where the strain on the tap does not exceed the limit for which the machine is set, there is no oscillation. It is claimed for this machine that it will tap one thousand  $3/16$ -in. blind holes in steel per hour with a bottoming tap,  $1/2$  in. deep, full thread.

The machine described is manufactured by the W. Gaterman Mfg. Co. It is to be made in radial and other types, and one of its features that will appeal to the owner of a small shop is that it can be quickly converted into a drill press.

OXY-ACETYLENE cutting has met severe competition in recent years from cutting with fuel gases and oxygen. This is believed to have resulted from difficulty in obtaining compressed acetylene during the war and immediately thereafter. According to the Oxy-Acetylene Welding Committee of the International Acetylene Association, the value of acetylene in this connection is being recognized more and more. A new field seems to lie in cutting out intricate shapes for parts for experimental machines. It is reported that in one case connecting rods were cut out by the oxy-acetylene torch. Forgings are being trimmed practically to finished size by this method.

# Industrial Standardization in Germany

Great Britain alone is carrying on this important work to an extent as great as Germany. A remarkable work has been accomplished in four years, or since the establishment of a central standardization body.

**I**NSUFFICIENT attention has been given to the role which standardization is playing in German industrial reconstruction. The German industries are planning and are carrying out a far-reaching program of standardization as a necessary step in building up an unprecedented industrial structure which must rest in large measure on an extensive foreign trade. In no other country except Great Britain is standardization work being carried on upon a scale or with an intensity comparable to that in Germany.

The German work is of special interest to those responsible for the management of American industries, not only because of its importance, but also because of the similarity in the historical conditions surrounding the national standardization movements in Germany and in America.

Prior to 1917 a vast amount of standardization work had been carried out in Germany by individual companies and by engineering societies and industrial associations, but as was the case in America before the organization of the American Engineering Standards Committee, the work had not been unified along national lines.

As has been the case with all the other national standardizing bodies, except the British, which was organized in 1901, the success of the standardization work carried out by the various countries during the World War as a part of their national conservation programs was a chief cause of the formation of the central German body. It is called the Normenausschuss der Deutschen Industrie, and was organized by the Verein Deutscher Ingenieure at the suggestion of the German Government in 1917. The present membership consists of engineering societies, industrial associations and government ministries, and, in addition, there are 700 firms who are contributing members. The work of the Normenausschuss deals only with those subjects which concern two or more industries or branches of industry.

## Work Accomplished in Germany

It is remarkable that the national standardization movement in Germany should have been so thoroughly organized and that so much work should have been accomplished in four years. One hundred and forty-four approved standards sheets have been issued and over 500 others have been so far developed that they have been published in tentative form. The standards are issued under the general designation of German Industrial Standards (Deutsche Industrie Normen, usually contracted to the slogan "Dinorm"). The Germans were the first of the national bodies to publish standards in loose-leaf form. The work is so divided as to make each sheet as nearly independent as possible. Firms purchase these sheets in quantity, issuing them directly to designers, draftsmen and foremen for use as working drawings and data sheets. (This plan is now followed by the Austrian, Dutch, Swedish and Swiss bodies.) The sale of sheets amounts to about 100,000 monthly.

Looked at broadly and with exceptions such as must always be made in general statements of the kind, the

continental countries are going much further into dimensional standardization than has been done in Anglo-Saxon countries. This includes interchangeability of supplies and of machine elements, the interworking of parts and of related apparatus made by different makers, and the interchangeability, so far as the use is concerned, of complete machines and apparatus. By far the greater part of the work of the Normenausschuss is dimensional, greater attention being paid to such matters as machine elements, screw-threads, bolts and nuts, standard diameters and systems of limit gaging. The Anglo-Saxon mind takes more to matters having to do with purchase and contract, such as specifications for materials and for performance of apparatus, methods of test, etc. The Normenausschuss itself has done very little of this type of work as yet, but it has been highly developed by some of the German special industry committees, for example, in the electrical industry. Some of these special industry committees are very active in the elimination of types, sizes and grades of manufactured products.

## Yielding Commercial Advantages

German manufacturers will go further in yielding apparent temporary commercial advantages for the sake of advancing their national industry as a whole than is the case in America or Great Britain. Three principal reasons for this are: The great economic pressure under which German industry is laboring; the mental trait of more readily acquiescing in decisions affecting national welfare, and the belief that an essential to the rehabilitation of German industry is the rebuilding and great enlargement of their export trade, for which the importance of standardization on national lines is more readily apparent than it is in domestic trade.

The Germans have not yet had their standards translated into foreign languages for use in export, as the British are doing, but they are now giving consideration to this question.

The standardization movement in Germany is particularly significant, since Germany is one of the three leading industrial countries. The industries of Austria, Holland, Sweden and Switzerland are so intimately related to those of Germany on account of geographical and other relationships that they are necessarily affected very largely by developments in Germany. Hence the work is bound to extend to these countries.

It appears that the work is being woven very intimately into the industrial fabric. The very large number of standards purchased by the industry and the fact that the central organization has 5000 firms which are co-operating members are sufficient indication of this.

There seems to be a striking analogy between the present standardization movement in Germany and the research movement developed there a generation ago. Whatever estimate one may place upon the role it played in German industries generally, everyone agrees that research was fundamental in the development of their great chemical industries.

# Co-operation Urged at Meeting of Fuel Men with S. A. E.

Technical sessions of the annual meeting of American Petroleum Institute devoted to automotive fuel problems which were discussed both from the standpoint of the refiner and the automotive engineer. Automobile men urge better quality of gasoline to cut down operating costs. Cheaper fuel will be difficult to obtain in the opinion of men from the oil industry.

CHICAGO, Dec. 8.

CLOSER co-operation between the petroleum and automotive industries in order to secure the maximum of fuel efficiency was the keynote of the annual meeting of the American Petroleum Institute which has just concluded here. The convention was well attended by both automotive engineers and oil men. The registration was about 500. Speakers from both industries emphasized the need for such co-operation and the duty to the public that is owed by both the fuel men and the automotive engineers.

Results of this co-operation, it was emphasized at the meeting, will prove beneficial to both industries for increased fuel efficiency will reduce operating costs and consequently increase the sale of both automobiles and fuel. Cheaper gasoline, it was pointed out by some speakers, is not so essential as a better quality of the fuel. When more miles per gallon can be obtained the car owner will be more willing to pay the price now required.

The technical sessions of the meeting were held as joint sessions with the Society of Automotive Engineers. While the two organizations have co-operated to some extent ever since the Institute was formed, this meeting was the first open gathering in which the mutual problems of the petroleum and automotive industry have been given joint consideration. The engineering branch of the automotive industry was well represented by men who are thoroughly awake to the importance which petroleum has played and will continue to play in the automotive industry.

Two joint technical sessions in which automotive representatives took part were held. One of these sessions was devoted to quantitative and qualitative discussion of the fuel problem. Dr. Van H. Manning, director of research of the American Petroleum Institute, read a paper giving a quantitative survey of the production of motor fuel. He showed that vehicle registration in this country increased 125 per cent from 1909 to 1920, while the production of crude petroleum increased only 101 per cent. In 1911 there were 315 bbl. of crude production for each car, but in 1920 only 48 bbl. of crude per car were produced. He admitted that "one is forced to the conclusion that the decline in production per car is becoming a serious factor," but maintained that there "should be no concern over a future supply of motor fuel." He indicated that at some future date reliance may have to be placed in shale oil as a petroleum substitute, and in imports from foreign sources. He said nothing, however, concerning possible intervening periods of stringency during the time required for the development of these resources.

Figures given by Doctor Manning showed that about 20 per cent of our petroleum requirements last year came from Mexico, but that this importation of crude furnished only about 5 per cent of our motor fuel supply.

H. M. Crane, consulting engineer, in his paper, "Requirements of Motor Vehicle Fuel," said every possible effort should be made by refiners to make the fuel supply more suitable for use in the really only simple form of engine now available. He declared engine simplicity is required if a reasonable degree of economy in the use of fuel is to be expected when handled by unskilled persons.

Mr. Crane also suggested a seasonal and local variation in fuel quality as temperature conditions permit.

Frank A. Howard, manager of the Development Department of the Standard Oil Company of New Jersey, said he recognized the great difference in combustion characteristics of various gasolines, but places emphasis upon the great economic difficulties involved in changing present conditions. Changes, he said, could only be effected by high prices, and these are considered undesirable by all concerned.

A somewhat pessimistic view of future petroleum supplies was taken by Harry F. Sinclair, Chairman of the Board of Directors of the Sinclair Consolidated Oil Corporation. Mr. Sinclair, however, said he expected that there would always be a plentiful supply of petroleum if the public was willing to pay the price. He admitted the situation in the Mexican oil fields is serious and will continue so unless new fields are soon located there. American interests, he declared, should take an active part in the development of other foreign fields if they intended to maintain their present supremacy.

The situation from the standpoint of the automotive manufacturer was taken up by Edward S. Jordan, president of the Jordan Motor Car Company. He declared there must be more mutual co-operation between the two industries and said the automotive manufacturers were endeavoring to make more efficient and economical vehicles. The public, however, he said, is demanding a better grade of gasoline. Ten million owners are using automobiles as utilities and their demands are for greater economy. He pointed out that the more barriers to sales that are removed the greater will be the volume of business for both vehicles and fuel.

N. A. C. Smith, petroleum chemist of the Bureau of Mines, presented a brief paper showing how the volatility of fuel sold as gasoline has varied from year to year, as determined by data collected throughout the country by the bureau. By taking the average and point of 10 per cent of the samples, comprising those at the upper end of the scale, and another 10 per cent comprising

those samples at the lower end of the scale, it was shown that the difference between the extremes was 80 deg. Fahr. in July of this year. In some previous years it was over 100 deg. Fahr., indicating that there is, at least, some tendency toward standardization, though the variation between the best and the poorest samples is very considerable. With the exception of a somewhat abnormal peak in July, 1920, it was shown that the average end point for all samples has steadily increased since 1915.

R. E. Wilson of the Massachusetts Institute of Technology presented a paper on "What Constitutes True Volatility," in which he suggested a change in the method of writing fuel specifications involving two specific tests for volatility and a single test for determining the knock-producing tendency.

The paper by C. K. Francis, chief chemist of Cosden & Co., dealt with variations in the quality of motor fuel, their extent and cause. He dwelt upon the desirability of low sulphur content and freedom from acid and mentioned some causes and effects of faulty blending. He spoke of the desirability of building engines more economical in fuel, but said nothing about the possibility of so improving fuel as to facilitate its more efficient utilization.

The first general (non-technical) session of the meeting was opened by an address by Thomas A. O'Donnell, president of the institute. This was followed by an address by Walter C. Teagle, president of the Standard Oil Co. of New Jersey, on the "Current Year in the Petroleum Industry," in which he dealt at length with the economic conditions of the past year and explained the reasons for the rapid decline in price of crude and refined products, which, he said, were in line with declining values of other commodities. He predicted the need for greatly increased production in the future, though the immediate future may not be quite so promising.

The paper by Edward L. Doheney on "The Future of the Oil Business in Mexico" dealt more with the past than with future or present conditions in that country, outlined the methods followed in locating oil there and indicated that similar methods will be successful in the future.

Edward Pizer, president of the Vacuum Oil Co., outlined European conditions and the outlook for improved commerce with European countries, with special relation to petroleum. He believes that the position of the American Government providing that its citizens be given equal opportunities with those of other countries with respect to investments in petroleum resources will be maintained. He said it would not need a great stimula-

tion of oversea industry to drain this country of present accumulated reserves of petroleum. He expects the foreign demand for petroleum products to steadily increase as the world settles down to normal peace conditions.

The papers presented Wednesday, Dec. 7, included one on "Standardization of Oil Country Supplies," by J. R. Stockton, and one on the practical effect of low volatility by O. C. Berry of the Wheeler-Schebler Carburetor Co.

Mr. Berry pointed out various ill effects of too low volatility and said the fuel mixture for highest efficiency is at the lean edge of the explodable range, and any range below the efficient point would tend to stall the engine. The range upward, he said, was very great. He pointed out that lack of knowledge as to proper carburetor adjustment was causing a loss of about one billion gallons of fuel annually. He also urged the refiners to keep in close touch with progress made by automotive engineers to the end that no further reduction be made in the volatility of fuel until the automotive industry is prepared to take care of it.

The paper by F. C. Mock of the Stromberg Motor Devices Co. outlined some of the limitations and difficulties imposed upon engine operation by variations in the volatility of fuel. He likened the manifold to a fuel still in which the fuel admitted is under ready control, while the degree of vaporization is not easily controlled. He indicated that it would be undesirable to hold all fuel to a recognized standard with the provision that fuel which does not conform to the standard should have the nature and extent of the variation clearly indicated.

Following the presentation of these papers there was a general discussion of the value of research to the petroleum industry.

R. L. Welch, general secretary of the American Petroleum Institute, presented an interesting paper showing that the price of products of the petroleum industry is responsive to the law of supply and demand, as with other commodities, in spite of some popular ideas to the contrary.

Harry L. Horning also spoke on the "Automotive Industry and Oil."

In his address at the annual dinner, which was the concluding event of the meeting, J. C. Donnell, president of the Ohio Oil Co., said that the present daily rate of petroleum production involves the draining of oil from over 135,000 acres a year, so that to maintain this rate a similar acreage must be developed next year. This, he said, will cost, including the cost of acquisition, royalty, drilling, lifting and wildcatting, nearly one billion dollars. The outlook for the coming year, he stated, is fairly bright, but is, of course, largely dependent upon development of the acreage mentioned.

## Industrial Libraries

**M**ORE than 200 special libraries directly concerned with collecting books and data concerning manufacturing and industrial subjects have been established in the United States. This fact was uncovered by the Special Libraries Association, which is a branch of the American Library Association. The former organization has compiled a Special Libraries Directory, which deals with practically all industries, and gives the location and scope of each library in that industry.

The special libraries listed under the heading, "Automotive Industry," include the following:

Class Journal Company, 239 West Thirty-ninth Street, New York.

Cleveland Tractor Company, Cleveland.

Combustion News Service, 43 Broad Street, New York.

Franklin Manufacturing Company, Syracuse, N. Y.

General Motors Acceptance Corporation, 1737 Broadway, New York.

General Motors Corporation, Hyatt Bearings Division, Newark, N. J.

Packard Motor Car Company, Detroit.

A directory of these libraries will prove valuable in that persons seeking information concerning the industry, who are outside the companies maintaining the libraries, can usually be accommodated by the librarians in charge.

## Aluminum from the Engineer's View-point

Editor, AUTOMOTIVE INDUSTRIES:

Dr. Rosenhain's recent article\* is a forcible illustration of the metallurgist rushing in where the engineer fears to tread. This is apparently becoming a fashionable pursuit among metallurgists, and one which may be fraught with very evil consequences owing to the natural inclination of the metallurgist to interpret engineering problems in terms of test pieces. It must never be forgotten that some of the finest real engineering the world has ever seen was accomplished before the metallurgist was ever heard of. Even now, is there any metallurgist who can give the engineer any real idea of what test should be applied to any material to determine its suitability for a given purpose and bet money on the result without resource to extensive experiment?

If Dr. Rosenhain would help the automobile designer to use aluminum he can do so much more effectively by correlating its capacity as compared with ferrous metal to resist surface pressure as when a nut and washer are pulled hard down, its capacity to resist wear when rubbing against cast iron, steel, brass or itself; its capacity for stress distribution in the neighborhood of fillets and drilled holes, etc. This latter brings to mind that probably the most useful work ever done from the designer's point of view is that of Professor Cokers' optical determination of stress distribution. Of what avail is it to conduct expensive and often misleading experiments on ultimate strength and impact tests when the only information given relates to that which occurs after failure has commenced? The engineer wants to know what happens before failure commences, or rather precisely where it commences in the stress strain diagram. In a word, he wants some clear idea of the stress hysteresis effect to enable him to advance from his present practice of determining the static load to which a piece may be subjected, doubling it to allow for shocks and then using a factor of safety from 5 to 10.

While no one is more enthusiastic than the writer over the possibilities of wrought aluminum, he must take exception to the tone of Dr. Rosenhain's article in respect to the reliability of aluminum castings. Some twenty years of intensive experience have revealed far more troubles and mysterious failures arising from the use of forgings than of castings.

The automobile piston, as is well known, has always been in the process of being lightened. A decade ago steel pistons were the "gout," and there are few designers who cannot bear witness to the agonies these produced through sheer mechanical unreliability. Wrist pin bosses pulled out by the roots, cracks started through lightening holes and piston heads collapsed. If any further adverse testimony is required to this use of steel forgings the unfortunate man in the machine shop who had to make them will readily contribute his quota. Granted

that all this was due to bad design, the fact remains that the weight reduction compared to cast iron was relatively small and that the cast iron piston, with its maximum tensile stress of 20,000 lb. or so, its complete absence of elongation or reduction of area, its utter incapacity to look an Izod testing machine in the face, did its job and did it well.

It is a matter for speculation as to whether the most prophetic metallurgist faced with the query as to the suitability of aluminum cast or forged for a piston in an automobile engine of, say, 4 in. more running at 3000 r.p.m. would say that a cast aluminum disk 3/16 in. thick would stand a pressure of some 400 lb. per sq. in. applied 25 times per second. Yet it does it and the cast aluminum piston is used in thousands of cars. If forged aluminum can give us a reduced coefficient of expansion, if by its use we could save even 10 per cent of weight for the same performance there might be something in it, but to suggest to an automotive engineering world already overburdened with difficulties that it should jettison a part on account of suggested advantages in respect of soundness and reliability for which an extended use has shown no demand is a needless addition to the burdens of life. If Dr. Rosenhain can tell us which alloys show the greatest resistance to wear under cylinder working conditions then will his information be gladly received.

Incidentally he would be advised to go easy on the question of removing the ribs from under the piston head. There seems to be a prevalent idea that a piston has only to be made of aluminum for all heat transmission problems to vanish. This is emphatically not the case, particularly with the modern type of a piston with a separated head.

The case for the forged aluminum connecting rod could well have been presented in more detail. Its advantages in respect of reduction of inertia pressure on big end bearings only need an elementary investigation to indicate how far reaching are the consequences of this particular application in respect of reduction in overall weight through shortening crankshaft and crankpin bearings.

The argument for the casting as applied to frame construction is that any frame of wrought material either steel or aluminum has weak spots where one part is fastened to another, to say nothing of a stress distribution throughout the length of the frame which renders the application of any rolled section, or for that matter pressed section, uneconomical. The only difference is that in the rolled section frame the waste material is carried about as a permanent burden, while with the pressed frame the surplus is left at the frame makers.

The charm of the cast aluminum frame is that the metal can be put where it is wanted, there are no riveted on brackets and it can be built up very simply in sections.

If anyone doubts the virtues of a frame which eliminates riveted on springs, horns, etc., let him make a casual inspection of the first dozen cars on the street which look over two years old and as if they had seen hard work.

\*Use of Wrought Aluminum Alloys in Automobile Construction. See AUTOMOTIVE INDUSTRIES for Nov. 3, 1921.

In connection with springs Dr. Rosenhain makes some startling suggestions and the writer would ask his comments on the following:

1. That the suitability of a material for spring purposes is a function of its resilience.

2. That for springs subject to bending the resilience is equal to  $\frac{f^2}{2E}$ , where  $f$  is the maximum stress the material will stand without taking a permanent set, and  $E$  is Young's Modulus of Elasticity.

3. That in the case of a good carbon steel spring of  $f = 190,000$

$$\frac{f^2}{2E} = \frac{190,000^2}{36,000,000 \times 2} = 501 \text{ in lb. per cu. in.}$$

4. That in the case of wrought aluminum the stress at which permanent set takes place probably does not exceed 58,000 lb. even with 88,000 ultimate so that

$$\frac{f^2}{2E} = \frac{58,000^2}{10,000,000 \times 2} = 170 \text{ in lb. per cu. in.}$$

5. Since the relative densities of steel and aluminum are as 2.8 : 1, the resiliency of aluminum for the same weight, as in the case of steel, becomes 450, which, although exceedingly good, does not suggest the substitution of aluminum for steel as a spring material.

At no time in its history has there been more opportunity for the extension of the use of aluminum than now, but there is no sense in starting with misconception if it can be avoided. It is particularly the field of the metallurgist to develop the alloys of aluminum and to give to the engineer a clear idea of the properties of these alloys in terms of the materials he is already using and with which experience has made him familiar.

Few people are so qualified to do this as Dr. Rosenhain, and it is to be hoped that in future he will write along these lines instead of suggesting the laborious machining of pistons from a drawn forging for which any

production engineer would cheerfully specify him being taken out and shot at dawn.  
FORALUM.

## Fuel Saving with Brakes

Editor, AUTOMOTIVE INDUSTRIES:

Your editorial of Nov. 17 certainly makes clear the necessity for better fuel economy and it is a question which should be solved without any more delay.

Any one who has taken part in fuel economy tests realizes that there are some points to be considered besides efficient engines. These are points which do not hinge on the future development of proper engine cycles so should be given more attention.

The curves on page 971 of AUTOMOTIVE INDUSTRIES show the comparative tractive resistances of a Franklin touring car and a Ford sedan. The values at a speed of 17.5 miles per hour are 31 and 65 pounds per ton respectively. There is not enough difference in the weights of the two cars to affect the results materially.

These tests were made on smooth pavements so the different forms of suspension probably make little difference. It is natural to presume that the difference must be accounted for by the types of transmissions used, by the types of bearings and tires and the condition of the brakes.

The writer has encountered pressed steel brake drums which were so badly out of true it was not possible to properly adjust the brakes. Rear wheel bearings which wear and cannot be adjusted are unable to hold the brake drums central with brake shoes. The ideal brake should not show any signs of heating unless it is used to slow up the car.

Considerable fuel can be saved if better stream lines are applied to body design, not because we insist on driving at 60 miles per hour but because we frequently drive 30 miles per hour against a 30 mile per hour wind.

R. M. GASTON.

## French Truck and Tractor Trials for Military Service

RENAULT, Berliet, Dewald, Pavesi, and Blum-Latil will be the competitors in the French military truck and tractor trials to be held in the neighborhood of Paris during the month of December. Three types of machines are provided for in the competition: 7½-ton trucks, 15 and 20-ton four-wheel-drive tractors, and heavy and light agricultural tractors, which must be either four-wheel-drive or creeper-band type.

This competition will determine the types of trucks and tractors which, while being sold to the public for commercial use, will have the benefit of a military subsidy and will be at the disposal of the military authorities in case of mobilization. Whereas before the war a normal type of 3½-ton truck was subsidized by the State and was used for the great mass of military transportation during the war, the military authorities now require only 7½-ton trucks. There is now no necessity to continue the subsidies for the 3½-ton truck, for thousands of these are in use and can be seized by the military authorities in case of war. The 7½-ton truck is very little used commercially, and in consequence its development has to be encouraged by military subsidies.

The four-wheel-drive tractors are almost exclusively military jobs, their commercial use being limited to forest and quarry work. The first rules to be published were of such a drastic nature that no ordinary tractors could be found to fit them, and in consequence changes had to be

made to let in more normal types. Even in their revised form there are very few agricultural tractors in regular construction capable of being entered for the French military trials. Machines of foreign construction are all eliminated, and the requirement of four-wheel-drive or creeper bands further reduces the possible competitors.

## New Classification of Tractors for Export

TRACTORS for export, after January 1, 1922, will be classified into four different groups so as to conform more closely to the requirements of manufacturers and exporters of the machines. The classification will be as follows:

1. Wheel tractors.
2. Track laying tractors.
3. Steam tractors.
4. Garden tractors.

The present classification, which has been in effect since April 1, 1921, does not differentiate between the different types of tractors, but merely includes "tractors" and "parts of."

The new classification has been worked out with the aid of the Statistical Division of the Bureau of Foreign and Domestic Commerce in accordance with suggestions from the industry. Its use should increase the value of export statistics of tractors to those interested.

# Wage Cost Per Unit Essential Feature of Cost Deflation

The cost of labor per unit of operation is important. The wage scale itself is comparatively unimportant. Reduced waste, increased productivity, and new mechanical improvements lead the way to reduced cost more rapidly than do wage reductions. Fundamentals of question discussed.

By Harry Tipper

**T**HE work of adjustment in the production field in the returning activity of business is proceeding with a good deal of difficulty. This is particularly the case with the adjustment of wages and working conditions to the point desired by the manufacturer and to the point insisted upon by the bankers and other economists.

During the last week an injunction was granted against an association of manufacturers in the New York clothing trade in what is understood to be the first case of the kind brought to the attention of the courts. The particulars are not especially interesting to other industries, but the general fact is suggestive in its indication of tendencies. The manufacturers and unions had an agreement in this trade concerning the wages, hours of labor, etc., which agreement had some months to run. A month or so ago the manufacturers gave the unions notice that they expected to revert to piecework and the unions gave notice of a strike. The unions asked for an injunction restraining the manufacturers from taking any action which would not be in accordance with the agreement already entered into, and an injunction has been granted on these premises in one of the New York courts.

At various times in these articles we have pointed out that the unions were not the only ones to break an agreement. Instances have been recorded illustrating the difficulty existing in employers' associations of securing the maintenance of agreements made with unions or with employees as the economic conditions changed. In fact, the whole history of strikes between labor unions and employers' associations is a record of broken agreements on both sides.

A great deal of publicity has been given to the breaking of agreements by labor unions, but very little has been said about the breaking of agreements by manufacturers, and this is the first occasion of which we have any record when the workers' organizations have taken legal action to enforce an agreement which the manufacturers were determined to abrogate.

## A Departure in Union Procedure

A somewhat similar principle was involved in the action taken by the coal miners' unions when the operators gave notice that they would discontinue the practice of taking the union dues out of the wages, as required by their agreement with the coal miners' unions.

Neither of these matters have been finally adjudicated, but they represent a departure in the procedure of the unions. In the past these bodies have been inclined to

rely entirely upon their own power in calling attention to the difficulties or in insisting upon the fulfillment of their agreements or desires. They have not been inclined to favor legal action or to apply to the courts for restraining injunctions in any dispute.

Where a formal agreement is made with organizations representing the workers, there is, of course, a binding character to the agreement which may become the basis of legal action at any time, and these appeals to the courts are interesting as indicating what may happen in the future under similar circumstances if the unions find it of advantage to pursue this method.

## Wages, Prices and Wealth

The general discussion upon labor questions still turns upon the matter of wage deflation, as it is called. Apparently no attention has been paid to the relation between wages, prices and the accumulation of wealth, so that it is presumed that the reductions of wages will automatically bring prosperity and that it is one of the principal difficulties in the way of returning prosperity. Practically no attention has been paid to the fact that the growth of wealth is due to the increasing surplus between the productive power and the amount required for current expenses, this surplus being stored up in convenient form either in product or productive facilities, nor to the fact that this wealth as a basis for credit permits a larger development for increased future efficiency.

The reduction of factory wages does not bring a proportionate reduction in the price which the user must pay for the commodities, so that the wage-earner whose wages have been reduced finds that his expenses are not proportionately less on account of the reduction.

Because of the uneven character of the adjustment taking place at present and the difficulties of securing a balance there will be a tendency for wages to reduce for some time yet, but the problem will not be settled by these means, because the increased consumption of product permitting the increased production of product is required to restore and increase the actual wealth above the national obligations.

The study of wages must be based upon the study of wage costs and the possibility of decreasing the wage costs without proportionately decreasing the wage rates.

The whole growth of the mechanical system of industry and the concomitant increase in wealth have been due to the ability of the producer and fabricator to

increase the productivity of the worker so that the wage cost per unit of product was reduced without decreasing the wage scale.

As a matter of fact, the wage scale for fifty years increased constantly, despite the temporary fluctuations at moments of depression.

It is somewhat astonishing to find discussions of bankers and other economists limited to the reduction of wages as though the efficiency had reached the maximum and it was no longer possible to increase the productivity of the individual worker, and consequently reduce the labor cost without having to reduce the scale.

The evidence in manufacturing is all to the contrary. Builders of mechanical equipment for manufacturing processes claim that it is possible to build a factory in almost any line of mechanical fabrication which would be notably more efficient than any of the present factories in the character and productivity of its mechanical equipment. Industrial engineers have been able to increase by large percentages the productivity of a plant by the introduction of better systems, and able executives in a number of instances have secured increased productivity by their ability to restore the incentive, increase the loyalty and develop the initiative of their working forces.

The waste committees of the American Engineering Council have made considered statements after their investigations which show a tremendous amount of avoidable waste adding its cost to industry in all directions.

These things indicate that the efficiency is far from the observable maximum, and our observable maximum will probably represent a minimum for future managers of industry.

It is unfortunate, therefore, that so much time should be spent upon the constant discussion of the reduction of wage scales and so little time spent on the question of efficiency and increasing the productivity of the worker.

The banker dealing with credit, finance, standards of reserve and other fixed items by which we measure our industrial actions is inclined to forget the dynamic character of industry and to regard the state of industry almost as he regards his own fixed standards of consideration. Gold is a standard by which we measure other values, and consequently it itself must be regarded

as fixed in order that the calculations may proceed. In his considerations of industry the banker is inclined to regard the productivity of labor as more or less fixed, the efficiency of industry more or less at a given point, and the cost of the industry influenced almost entirely by the rates of time costs operating in connection with it.

This method of examination is entirely illogical and has nothing to recommend it. It is not in accordance with the past history, nor in accordance with our known industrial conditions. The periods of greatest prosperity—that is, the periods when our wealth accumulated most rapidly—have been periods of decreasing costs and increasing wages, because they were periods of increasing efficiency. Gradually it is going to dawn upon us that 1913 or 1914 values may have been normal for that time, but they are an absurd comparison for this time. Values have been entirely rearranged and there is no possibility that they will return to the basis which existed before the war.

Instead of using all kinds of means in the endeavor to go back to 1914, we would be better off if we were considering the increase of efficiency that we must secure in order to balance our operations with the new valuations, and raise our manufacturing development to the plane demanded by the new conditions emanating from the war.

The scale of wages is in itself entirely unimportant. The only important thing to the manufacturer is the cost of labor per unit of operation, and past history shows that the reduction of wastes, the increased productivity and the development of new improvements have been the proper ways of reducing cost, and not wage reduction.

Under the present conditions when industry out of balance is attempting to readjust itself, demands will be met in most cases by the reduction of wages, but this will be entirely temporary in its effects and will not succeed in doing more than alleviate the severity of the adjustment.

New methods must be devised, new equipment discovered and a new appreciation of the waste of human endeavor determined in order for us to meet the obligations imposed on industry by the war and the necessities demanded for future improvement.

## Tests of Stellite Tools

SOME notable results of performance tests with stellite (an American cutting alloy) are reported in *Zeitschrift für Metalkunde* for September, 1921. Chemical analysis showed the alloy to consist of 50 per cent cobalt, 18 per cent molybdenum, 19.5 per cent chromium, 9 per cent tungsten and 1.5 per cent carbon. In the house organ of Albert Herbert, Ltd., it is stated that by the use of stellite the cutting speed may be increased from 75 to 150 per cent. These claims were fully borne out by the tests reported in our source. A necessary condition, however, is that the cutter is ground to semi-circular form and that the cutting angle does not exceed 5 deg. All other forms of the tool bit resulted in a materially reduced life. In comparative tests with stellite and tungsten (high speed) steel a cutting speed of 130 ft. per minute was used to start with. The depth of cut was 0.080 in. and the rate of feed 0.01 to 0.032 in. per revolution. After the work had been going on under these conditions for 5 hours, the cutting speed was increased to 180 ft. per minute, the cross-section of the cut being  $2 \times 0.00122$  sq. in. In this case the cutting edge of the stellite was destroyed in about 50

seconds. After the bit was ground anew, a plane shaving of 0.012 in. depth and 0.0048 in. feed per revolution was removed, the cutting speed being 308 ft. per minute. Under these conditions the tool worked well. Only when the cutting speed was increased to 385 ft. per minute was the cutting edge destroyed, this happening after 30 seconds. With high percentage tungsten steel it was absolutely impossible to work under the conditions mentioned. The result of the tests is that with stellite a materially higher cutting speed can be maintained in wet as well as in dry turning than with the best tungsten steels. This is its main advantage. In the case of pieces with little stock to be removed, it is possible, by increasing and even doubling the cutting speed, to save a great deal of time. Stellite is equally advantageous in the machining of hard materials. On the contrary, if a great deal of material is to be removed, so that the width of the shaving is large, the conditions are less favorable for the stellite bit, which on account of its form is less suited to the purpose. It is also not so well adapted for cutting screw threads on steel bars, etc.

## Buy—Build—Work

PART of our business depression has been real; it has been caused by economic factors resulting from the war and could scarcely have been avoided. Part, however, has been psychological, the result of fear. This last part has been unnecessary and has caused unnecessary financial losses and human suffering. It should never have been and can be dispelled readily by a more optimistic view of conditions, by a firm belief in the essential soundness of industry, and by determination to go forward on this basis.

"Buy—Build—Work and create a job for every man." This is one of 24 slogans adopted for a poster campaign inaugurated by the Rotary Clubs of the United States in an effort to overcome the fear psychology which has permeated many business organizations during recent months. The above slogan and the ideals behind the entire campaign should be supported actively by the automotive industry. It should be supported by deeds as well as by words.

Aside from the psychological effect such a slogan may have upon American industry, the actual physi-

cal results from the actual practice of the motto will prove beneficial. Psychological causes produce physical effects and if the slogan adopted is carried out to its fullest extent the so-called business depression will rapidly disappear. Buy—Build—Work.

## Standards Are Created to Be Used

WE fear that the executives of the automotive industry, taken as a whole, have failed to grasp the importance, not to say the economic necessity, of standardization. If this is not true, how else are we to explain, not only the lack of standardization along many lines, but the failure to make full use of many standards already created?

Many manufacturers, including some of the largest car and parts makers in the industry, adhere rigidly to standardization within their own plants, but utterly fail to appreciate the need for bringing these standards into conformity with the standard practice of other makers. They are, in short, a law unto themselves. Like most people of whom this can be said, they are standing in their own light.

Perhaps one illustration will suffice to make this point clear. A certain manufacturer had long employed a set of his own specifications under which all steel which he required was purchased. These specifications differed an inconsequential amount from the standard S. A. E. steel specifications. He did this in spite of the fact that the steel mills (whether the purchaser knew it or not, we cannot say) charged a little more for them than for steels ordered in accordance with the generally accepted standard. This thing went on for some time, for the steel received was quite satisfactory. But one day it occurred to someone to check the actual analysis of the various steels against the factory specifications. They differed slightly but were found to correspond to S. A. E. specifications. It developed, in fact, that the steels were S. A. E. steels, but the vendor had covered himself against a possible technical rejection by charging a slightly higher price than if the order had specified S. A. E. steels!

This may be considered a good joke on the purchaser, but no one will deny that it was poor business. A full recognition of the value of standards would render impossible such situations.

If a standard has been in existence long enough to receive any very general recognition, a manufacturer will find in nearly every case that a change to the standard will benefit him directly, or indirectly, through benefiting the purchaser of his product.

This last-mentioned phase of the situation, the ultimate benefit of the user, is of great importance and far too often lost sight of. We frequently hear it said that so-and-so is such a large buyer or producer that it does not matter whether he uses a certain standard article or not. He can get a certain special size of bearing, for example, as cheap or perhaps a trifle cheaper than a standard size. At first glance this may seem like a real economy, and if the matter ended there it might be.

But it does not and it cannot end there. Once employed this special size must be stocked by the manufacturers of the bearing, of the axle, let us say, and of the car in which it is used, and by a thousand parts depots and ten thousand repair shops, if they would give prompt service. Now if we multiply these special sizes by twenty or fifty—for if one manufacturer gets a special size others will do likewise—the capital tied up in stocks of special parts alone becomes a serious item. Of course the car user pays the bill in the end, but his dissatisfaction with the manufacturer increases as maintenance expenses increase, and the sale of new products is correspondingly handicapped.

We hold no brief for the unqualified acceptance and use of all so-called standards. Doubtless some of them are outworn, immature or in some way out of step with modern conditions. These can and should be revised. Standards, in the sense used here, are not inflexible things which cannot change with changed conditions. But the bulk of those in existence are good and should be used. On the whole the automotive industry has adopted and used standards to a much greater extent than most other industries, but it still has a long way to go in this direction and must take no backward steps.

## The Export Business Picking Up

FROM Detroit comes with increasing frequency the report that such and such a company is building right-hand drive cars that can only be for sale in foreign countries. Washington adds that the shipment of cars, trucks and parts were so large in October that we must go as far back as last January, when old orders long held up were being filled, to find exports of these products appreciably higher. From New York comes the statement of various exporters that the overseas trade progressed through November in as large or larger volume than in October.

Buenos Aires sends a cable announcing that the annual motor show, held during two weeks in November, brought brisk sales and that the trade there is greatly encouraged. The Ford plants in Sao Paulo, Copenhagen and Manchester are operating on schedules appreciably increased—in fact, 100 per cent at Copenhagen and practically so at Manchester with a daily output of some 100 cars and trucks.

Barranquilla advices tell of increasing sales, with dealers turning over in August, September and October numerous cars of various makes. Lima adds that exchange has so bettered that several lines have reduced prices with a consequent stimulation of retail business. An automotive expert returning from Havana declares that the automotive dealers in the island republic are in better shape than most dealers and the monthly export figures show that a surprising volume of business is continuing right through the worst depression Cuba has ever undergone. Mexico is holding her purchases to the high level set in early months, despite the oft-repeated assertion that a let-up is imminent, and Porto Rico reports new buying is necessary to meet the demands for military transportation.

The Far East is buying again. The pound sterling has risen so consistently and is off from par such a slight percentage, not even 20 per cent, that buying in all the English dominions has been stimulated greatly. Even the most pessimistic exporter cannot fail to see Australia definitely on the comeback and South Africa is once again getting into the buying column. One company is shipping cars to Syria and Spain, it is stated, with a rising currency, will revise her prohibitive automobile duties not later than January.

The international political and business situation is clearer to-day than it has been since the war began. Europe is regaining its feet economically and industrially and the recent course of the exchange markets show that this improvement is extending to the realms of finance.

Thus, we find a general condition that can mean but one thing. The foreign markets are again stirring into life and are doing their part in taking up the slack of production, the final 5 or 10 per cent that means the difference between profit and loss. They are beginning to take cars when the home market is slumping off because of winter.

This is the reason for foreign trade and this is the reason American automotive manufacturers cannot longer neglect their export trade. When markets are dull at home, in the winter season, then the foreign sales will bolster up the total and keep up production.

## Maintaining Standards and Prestige

A RECENT article in the London *Times* from that paper's correspondent in Colombo, Ceylon, deplores the fact that some American cars that have been shipped to that territory recently are decidedly inferior, as regards workmanship and material, to the older models of the same makes of cars. The dispatch stated, however, that some makes of American cars, notably those in the lower price class, were still selling quite well among people in the cocoanut territory.

American manufacturers cannot well afford to permit their products to lose prestige in the eyes of the natives of foreign countries. Exporting will play a large part in determining the volume of business the automotive manufacturer will do in future years. If American cars manufactured for export do not reach the standard set by the manufacturers themselves then there can be but one logical result: the business will revert to the manufacturers of other nations.

The same dispatch from Colombo furnished the information that a London taxicab company had purchased the interests of a similar concern in Colombo and planned to enlarge the business to the extent of adding new cars and building new garages. It was also stated that there is ample scope for the founding of similar enterprises, for the cities of Galle and Kandy are without taxicab services. The Colombo Tramways Company has also decided to augment their service with bus lines running from the ends of their car tracks to suburbs.

# Peace Restored in Willys Councils

## Agreement Reached with All Interests

Personal Victory for Willys—  
Banks Agree to Miniger  
as Receiver

NEW YORK, Dec. 6.—An amicable agreement for the settlement of the tangled affairs of the Willys Corp., now in receivership, was reached yesterday at a conference which was the climax of a series following the action of the bank creditors in having C. O. Miniger and Frank Kennison of Toledo ousted as receivers for the property in New Jersey. They were the original receivers appointed by Judge Killits in Federal court at Toledo.

Under the plan which has been agreed upon Miniger will remain as receiver in all districts, acting with Colonel Francis G. Caffey of this city. Kennison will be retained as a co-receiver in Ohio and Judge Killits will be asked to approve Caffey for this district.

### Interests Amicable to Arrangement

All interests have announced that they will be satisfied with this arrangement and will work together harmoniously to reorganize, refinance and straighten out the affairs of the corporation. All court actions will be withdrawn and it is expected a plan of procedure will be decided upon which will be satisfactory to everyone.

The agreement may be regarded as a victory for John N. Willys, who has contended from the first that he acted only for the best interests of all concerned. When it was agreed to file a receivership petition in Toledo, it was urged by Willys that Miniger be named as one of the receivers and the bank creditors' committee be asked to suggest a man to act with him. The course decided upon yesterday merely carried out his original recommendation.

### Receivership Due to Misunderstanding

A statement issued at the close of the conference stated that the receivership was due to a misapprehension. An erroneous report that interests in the East intended to take court action reached other interests in Ohio and the West and they filed their petition with Judge Killits. An identical petition was filed with Judge Knox in the United States District Court here and he appointed Miniger and Kennison as receivers. Similar action was taken in New Jersey.

Incensed at what they characterized

## FIRST COAST TO COAST CAR SHIPMENT IS MADE

NEW YORK, Dec. 6.—The first coast to coast trainload shipment of automobiles left here last night. The train carried 150 touring cars from the Long Island City plant of the Durant Motor Car Co. of New York consigned to the Oakland plant of the Durant Motor Car Co. of California.

The train, which was composed of 30 freight cars, will cover 3285 miles. The shipment weighed 350,000 lbs. and the freight charges will aggregate \$20,000. The cars will be distributed from the Oakland plant.

the desire of Willys to dominate the receivership, the bank creditors' committee filed petitions in the Federal courts here and in New Jersey for the substitution of receivers other than those appointed upon the petition of the Ohio Savings Bank of Toledo. Judge Knox appointed Caffey, a former United States district attorney, as a co-receiver in the southern district of New York, while Judge Bodine, sitting in Federal Court at Newark, removed both Miniger and Kennison, substituting for them Clifford I. Voorhees, a New Brunswick attorney, and James Kearney, publisher of the *Trenton Times*.

### Delaware Motion Postponed

Before the agreement was reached, a bill of complaint was filed in Federal Court at Wilmington, Del., by the Chase National Bank, the Equitable Trust Co., the New York Trust Co. and the Chemical National Bank, all of this city, seeking the appointment of a receiver in that State for all the property and assets of the corporation wherever situated or controlled, on the ground that the corporation was chartered in Delaware. A hearing on this application was to have been given yesterday but it was postponed until Thursday. It has been decided that when the argument is heard the Delaware court will be asked to appoint Miniger and Caffey. The same procedure will be followed in the northern district of New York, so that all interests may co-operate in these districts.

(Continued on page 1143)

## "GOODSPEED" TO BE EXHIBITED

CHICAGO, Dec. 5.—The new car which is being developed by the Commonwealth Motors Co. under the direction of Leland F. Goodspeed will be exhibited at the New York and Chicago shows. It will be called the Goodspeed.

## Newark Court Urges Fullest Cooperation

Willys' Chief Concern Is That  
Reorganization Shall Not  
Be Retarded

NEWARK, Dec. 5.—After hearing arguments by attorneys representing the interests which objected to the domination by Willys of the receivership, Judge Bodine appointed as substitute for Miniger and Kennison a New Brunswick attorney, Clifford I. Voorhees, who was named by him originally to serve with the other two and James Kerney, publisher of the *Trenton Times*, who has acted as receiver in various other cases.

In announcing his decision Judge Bodine said that "no reason exists why there should not be the fullest co-operation between the Ohio receivers, the New York receivers and the New Jersey receivers."

### Elizabeth Plant in Argument

It was contended by counsel for Miniger, Kennison and Willys that inasmuch as the big new plant at Elizabeth never had been in operation, the New Jersey receivers would have no concern except in relation to stocks and bonds. The lawyers asserted that the principal earnings of the corporation came from the Electric Auto-Lite Corp. at Toledo of which Miniger is president and that this should be a determining factor in the receivership. Another source of income is the New Process Gear Corp. at Syracuse and the United States Light & Heat Corp. at Niagara Falls, of which Miniger is also president.

A dramatic story of his defiance of one of the most powerful banking groups in America can be read between the lines in an affidavit signed by Willys filed with Judge Bodine.

### Affidavit Explains Situation

"My primary concern in this whole matter," said the affidavit, "is that reorganization shall not be retarded by failure of co-operation between different sets of receivers in the different jurisdictions in which the property is situated, but that on the contrary the receivership appointed in the primary jurisdiction (Toledo) should be made the officers of the court in the ancillary jurisdictions, with the addition, if desired, of a third receiver, selected by the court, as was done in New Jersey by the appointment of Voorhees.

"Although he is an entire stranger to me, his selection is entirely satisfactory to the common stock interests for which I am entitled to speak, and I respectfully urge in the interest of orderly and harmonious admin-

# Prepare Plants for January Output

## Falling Production Is Approaching End

**Factories Are Not Planning to Close for Inventory Before Christmas**

DETROIT, Dec. 3—Production in the Detroit factories, which has been falling somewhat steadily since Nov. 1, will reach its lowest figures this month, with certainty of an early pick-up following the turn of the year. There will be no closing of plants except for inventories at Christmas time and the month will be devoted principally to preparing for production in January.

Practically all of the factories in the district are working on a half-time basis, some with half the usual work force, some three days a week with full force and some working half days only with full force.

Dodge is working a close to normal force on engine assembly, getting ready for quick production in January. It has been on a 400 a day basis since Nov. 10.

Ford finished November with approximately 75,000 cars shipped and will continue into December on the same basis, though the Highland Park plant will be closed for inventory at Christmas and production is expected to be cut previous to this date.

Maxwell with its new models is increasing its production 30 per cent Dec. 1, and will make continued increases. The factory is working full time and is gradually adding men.

Durant plant at Lansing will start production Dec. 20 on a 100 a day basis and will continue at this rate until March 1, when it will be increased.

Cadillac is leading General Motors units in production and is operating on practically a 100 per cent basis.

Oakland is on a basis of 100 cars daily working a full week.

Chevrolet continues to be a steady producer in the light car field and has suffered but slightly from seasonal depression.

Buick and Oldsmobile are operating at about half the rate of the third quarter, the former being on a three day week.

Hupp is producing at the rate of 50 cars daily and expects to build 1300 cars in December.

Reo is working half days and is turning out about 100 cars and speed wagons daily.

Earl Motors is operating steadily on about 60 per cent basis.

Hudson-Essex reports continued sales progress and expects to continue operation into December on approximately the November basis.

Columbia, Liberty and Paige are mak-

## PROSPERITY CAMPAIGN OPENED IN NEW YORK

NEW YORK, Dec. 5—The first of 100,000 billboards to be used by Rotary clubs in the United States and Canada in a prosperity campaign was unveiled in Times Square in the presence of 2000 persons after an address by Raymond J. Knoepfel, president of the New York Rotary Club. The billboard, which has been erected in 43rd Street near the intersection of Broadway and Seventh Avenue and which faces north, bears the following message written by President Harding, with a reproduction of his signature:

"The White House,  
Washington.

"The people of Washington and Lincoln are conquering the difficult problems of to-day no less worthily and with the faith and confidence which they bequeathed to us. We are sure to find the ways to restored prosperity and our mood of happiness.

"WARREN G. HARDING."

ing steady shipments and with new dealers and distributors look for gradual improvement.

Studebaker plants in Detroit and South Bend have been down for inventories in the past week but are now resuming, the South Bend plant on Dec. 5 and the Detroit plant the week later. Practically 100 per cent production is looked for on resumption, November shipments approximating 3000.

Wills Ste. Claire has entered upon half time operation for December.

Packard reports continued large shipments in the light six model with steady gains in truck demand.

Saxon is operating strictly on a sales basis and reports the signing of new dealers in many localities.

## REED FOUNDRY EXPANDS

KALAMAZOO, MICH., Dec. 5—The Reed Foundry & Machine Co. has awarded a contract for the erection of a machine shop immediately adjoining its steel casting foundry here. Work will be rushed on the initial units and is expected to be completed by Feb. 1. Contracts for the necessary mechanical equipment are being placed. The outlook for business for the Reed company is declared at the factory to be excellent. The production of tractors will be an important feature of the business.

## Month Makes Record in Shipment of Cars

**First of Year to Show Increase Over the Same Period of 1920**

NEW YORK, Dec. 6—The automotive industry has safely passed the bottom of the depression and the worst is over. November was the first month of the year to show an increase in shipments as compared with the same period of 1920. The gain was material, and it is probable each succeeding month, until March at least, will mark an equal or greater gain over the corresponding 30 days of the preceding year.

While there was a seasonal decline as compared with October, the falling off was not as great in proportion as it was in 1920. As December opens, the outlook is more encouraging than it was expected to be a fortnight ago. The volume of sales, chiefly because of the good demand for enclosed cars, will approximate, in dollars, the business for October.

## Stability Indicated

The stability of the industry is indicated by the fact that October was the eighth consecutive month to show only a slight variation in the volume of business done by the parts and accessory makers. There was a decline of less than 5 per cent as compared with September, and business has been on much the same basis since the end of February. It can be predicted confidently that the total of sales for November will show little contraction, and it would be no surprise if the December showing was correspondingly good.

Manufacturers in both the parts and vehicle fields, whose financial affairs are on a reasonably solid foundation, can view the future with confidence. The volume of passenger car sales in 1922 will be fully as large as in 1921, and in the truck field they promise to be considerably better. Interest in highway transport, both freight and passenger, is steadily increasing. An interesting trend is found in the fact that both steam and electric railroads are coming into the market with greater frequency for trucks and buses.

(Continued on page 1147)

## Northern California Sales Continue Gain

### Demand Is Reported for Medium and Higher Priced Automobiles

SAN FRANCISCO, Dec. 5—A slow but steady increase in the sales of passenger cars has been manifested throughout northern California during November, even exceeding October, when 4920 passenger cars were sold in that month of 1921, as compared with 4469 in October, 1920, an increase of about 451 cars.

The increase was largest in the medium and high priced cars, rather than a result of greater sale of the lowest-priced automobile. The automobile industry apparently has passed the lowest point of its depression in California and is once more on the up-grade.

San Francisco—county and city being co-linear in area—recorded for October, 1921, one of the largest months the automotive industry ever has had here, nearly doubling the sales of October, 1920, the actual figures being 1173 cars in October, 1921, and 716 in October, 1920.

#### All Counties Increase

Alameda County, which contains Oakland, the second city in northern California, reports sales of 706 cars for October, 1921, as compared with 588 sold in October, 1920, an increase of 20 per cent. Some dealers showed increases of 50 per cent for the month; others were not so fortunate, but all showed an appreciable gain for October, 1921, over the same month of 1920. Contra Costa County dealers sold 107 cars in October, 1921, compared with 88 cars in the same month a year ago. Santa Clara County dealers disposed of 288 passenger cars, against 246 in October, 1920.

Fresno and Tulare counties, usually two of the best markets for passenger cars and trucks in the State, showed a falling off, in some unaccountable manner, from their records of October, 1920. In Fresno County, only 374 passenger cars were sold in October, 1921, while 435 were disposed of in the same month one year ago. Tulare took only 204 cars in October this year, as compared with 254 in October, 1920.

## Demand for Castings Feels Sharp Revival

MILWAUKEE, Dec. 5—The Chain Belt Co., Milwaukee, which has been operating its gray iron foundry three days a week with reduced forces nearly all of this year, on Dec. 1 returned to a six-day weekly schedule and increased its force to a number equivalent to the largest staff it has ever employed. This is due to a sharp increase in orders for castings from a variety of sources, principally machinery, motor vehicles, etc.

The malleable iron foundry is increasing its schedules as well.

The Belt company expects only a fair year in its own productive lines, including concrete mixers, paving outfits and construction equipment, but on the basis of present commercial orders for castings from other manufacturers it believes 1922 is going to be a splendid year. It is wholly unusual to experience a sharp revival in demand for castings at the end of the year and the rush at present is regarded as a good omen, especially since orders specify deliveries as far as three and four months ahead.

## Take Appeal from Order Directing New Owen Sale

WILMINGTON, DEL., Dec. 5—An appeal has been filed in the United States District Court here from the court order granted a few days ago directing a new sale of the personal property of the Owen Magnetic Motor Car Corp., near Wilkes-Barre, Pa. The order refused confirmation of the previous sale, at which \$136,000 was bid by clients of Nathan Bilder, who presented the appeal.

The contention of the receiver and Reuben Sattethwaite, counsel for the Wyoming National Bank of Wilkes-Barre, is that the acceptance by the bidders of the return of their bidding check bars them from the right of appeal. The position of the court was that a bond should be required for performance in the event that its ruling should be reversed in a higher court, and a satisfactory form for such bond is to be presented.

## Jacobsen Increases Stock to Meet Demand of Trade

RACINE, WIS., Dec. 5—To finance production of increasing orders, the Jacobsen Mfg. Co. has increased its capital stock from \$60,000 to \$100,000 and on Jan. 1 will increase its operating force from 90 to 100 per cent. It manufactures the "Four-Acre Motor Driven Lawn Mower," placed on the market about a year ago and now widely used by parks, universities, colleges and schools, golf and country clubs and other institutions maintaining extensive lawn acreage.

The Jacobsen machine is in use at Yale University, Northwestern University, Chicago Park Board, Milwaukee Country Club and along the Pacific Coast. An Evanston (Ill.) concern has placed an order for 200 machines.

#### A. E. A. PLANS LABORATORY

CHICAGO, Dec. 5—Plans under way at the national headquarters of the Automotive Equipment Association promise to establish under the control of the association at no great distance from here a laboratory in which replacement parts and accessories will be tested and the stamp of the A. E. A. placed on them. The idea in promoting this new feature of association work is to aid the merchandising of parts and devices.

## "Conservatism," Chief Lesson 1921 Taught

### M. A. M. A. Queries Manufacturer on What Industry Learned During Year

NEW YORK, Dec. 5—The Motor and Accessory Manufacturers' Association asked its 400 affiliated manufacturing concerns this question:

What is the paramount lesson learned by the automotive industry in 1921?

The overwhelming majority of the responses indicates that the chief fundamental lesson learned by the automotive companies during the year was the necessity of maintaining conservative, balanced inventories.

Corollaries of this mentioned by most of the companies was the danger of over-expansion and over-optimism; the menace of "over" overhead; the necessity for rigid, but sound, economies; and the elimination of "rainbow chasing" from business.

General conservatism in buying, greater prudence in making commitments and closer period buying are mentioned by virtually all the executives who contributed to the symposium as last year's principal contribution to business wisdom.

#### Must Be Guided By Consumer

Another significant recurrent note in most of the statements is the lesson learned by manufacturers that the viewpoint of the ultimate consumer must to a greater extent guide production and distribution policies.

The experience of the automotive industry last year, in the opinion of a leading automobile engine manufacturer whose statement is typical of the rest, will be "enormously beneficial in guiding the future policies of the industry. It has taught every one the need for closer period buying."

One of the largest axle manufacturers in the United States sums up the lessons of 1921 thus:

"The paramount thing taught by last year's experience is that the saturation point has been switched from manufacturers' production to used cars, and that until those now in the hands of the dealers can be disposed of there should be a decided contraction in the new product."

A representative unit manufacturer says:

"We must pay attention to fundamental principles in manufacture and in business. Our inventories must be kept within reasonable bounds; we should not sign contracts more or less blindly and, in short, we should conform to the laws of sane business, which for some reason or other we seemed to have forgotten during the preceding few years.

"We have learned, also, of the evils of 'over' overhead; we have learned how to economize in our shops; we are thrifty, whereas always in the past we have been reckless; and we are thinking more of what the public or our customers want, rather than what we feel they should use."

## Milwaukee Prepares For Steady Output

### Nature and Volume of Orders Most Encouraging Since July 1

MILWAUKEE, Dec. 5—The manufacturing situation in the automotive industries at the beginning of December is one of excellent prospects, compared with most other months this year. Makers of parts, engines, bodies and equipment look for a fairly active month, but the real optimism lies in the fact that orders taken during November and so far this month, for delivery beginning immediately after Jan. 1, are of a more encouraging nature and volume than since July 1.

#### Inventory Period Advanced

In fact, these orders in the case of numerous large manufacturers are such that it was deemed advisable to advance the usual inventory period at the close of December, or over the holidays, to the latter part of November, so that the decks might be cleared for steady production. There is nothing startling or sensational about these orders, but they are so much better than the regular run of business in recent months that favorable comment has been aroused in respect to definite improvement in business.

Usually December is a quiet month in all metal trades lines, but this year it doubtless will develop into an unusually active one, although most of the activity is based on preparation for a general upward tendency of production beginning with the New Year. A high spot in the situation is the pressure exerted by orders upon manufacturers of enclosed bodies, of which there are numerous large interests here.

#### Retail Trade as Usual

Some quickening of retail demand for passenger cars is observed on the basis of successful solicitation of Christmas business although in a general way trade is of about the usual early December character. The absence of any heavy snowfall so far this winter has helped business, for the season still is of such quality that motorists are able to make the freest possible use of cars.

This month usually is the slowest of the year for retail sales, and probably will be only an average one. However, with the annual Milwaukee show coming in six weeks, local dealers expect to experience the usual resumption of consumer interest which this event always excites. Enclosed car sales at this time are running from 15 to 25 per cent ahead of a year ago.

#### RUGGLES ELECTS OFFICERS

DETROIT, Dec. 5—The Ruggles Motor Truck Co., Saginaw, which recently acquired the Huron Motor Truck Co., has elected the following officers and di-

rectors: Frank W. Ruggles, president; W. J. Wickes and Julius B. Kirby, vice-presidents; Ezra L. Smith, secretary; Charles T. Kerry, treasurer; John F. O'Keefe, counsel; directors, the officers and Benton Hanchett, Otto L. Dittmar, H. T. Robinson, Guy S. Garber and Walter C. Hill, all of Saginaw; Harry H. Price, Columbus, Ohio; John J. Thorne, Bay City; John Ryan and Albert E. Sleeper, Bad Axe.

## Hampden Motors Formed to Make 2-Ton Trucks

HOLYOKE, MASS., Dec. 5—The Hampden Motor Truck Corp. has been organized with \$1,000,000 capital to engage in the manufacture of 2-ton trucks. A site of eight acres has been purchased in Willimansett, and plans have been drawn for a one-story brick factory comprising two acres of floor space.

It is proposed to build only one model to sell for around \$2,000, and to be ready for production to begin next spring. Though not built primarily for speed, the truck will be of somewhat lighter design than usual for a vehicle of the size. Concentration on one model is expected to be an element of economy, and distribution will be simplified by selling direct through established dealers. A number of original ideas in construction are planned.

The corporation is composed of Holyoke men with these officers: President, Richard D. Bloom; vice-president, John F. Lynch; treasurer, Ernest S. Steele; directors, R. L. Davenport, John H. Woods, C. H. Collins, F. G. Burnham and C. P. Lyman.

## Pierce-Arrow Awarded New York City Contracts

BUFFALO, Dec. 5—The city of New York has awarded to the Pierce-Arrow Motor Car Co. a contract for 87 heavy duty motor trucks with a total value of \$350,000.

The order will place the production capacity of the company's truck department at about 100 per cent. At present it is running a little above 90 per cent.

The trucks are to be used by the department of streets, some of them in the city's snow fleet.

## Compromise Offer Made on Shuler Axle Claims

LOUISVILLE, KY., Dec. 5—A compromise offer of 20 per cent on claims was made by Charles B. Seymour, attorney, in behalf of the Shuler Axle Mfg. Co. at a hearing before Judge George A. Brent, referee in bankruptcy.

Action on the offer has been set for Dec. 14 by Judge Brent and if 51 per cent of the creditors accept by that time the suggested settlement will be confirmed. According to Elliott Pennebaker, attorney representing 80 per cent of the creditors, the claims against the Shuler company aggregate \$100,000.

## Claims Combination Enhanced Oil Prices

### Federal Trade Commission Makes Report on Pacific Coast Petro- leum Industry

WASHINGTON, Dec. 5—Charges that prices of gasoline and other motor fuels sold on the Pacific Coast were unduly enhanced by so-called combinations among oil companies are made by the Federal Trade Commission in part 2 of its report on the Pacific Coast petroleum industry, as submitted in response to a special resolution introduced by Senator Poindexter of Washington, in the first session of the Sixty-sixth Congress. The report contains a large number of letters and documents giving in detail what purports to be evidence of agreements and understandings covering prices.

#### Marketers Association Mentioned

The commission accuses the Independent Petroleum Marketers Association of Los Angeles of having arrived at an understanding on prices in 1915. This report is especially interesting to the automobile industry because of the fact that the acute gasoline shortage on the Pacific Coast on two or three occasions during this period resulted in heavy losses to manufacturers and dealers through restricted sales, etc.

According to the report of the commission:

"The retail price of gasoline at San Francisco increased from 15.5 cents per gallon in January, 1914, to 27 cents per gallon before the end of 1920. The wholesale tank wagon price of kerosene at San Francisco remained at 9 cents per gallon from January, 1914, to August, 1918, after which time it advanced rapidly to 16.5 cents by the end of 1920; kerosene price changes are influenced largely by conditions in the export market.

"While the increases in the prices of these refined products were not so marked as the advances in crude prices, owing chiefly to less pronounced increases in transportation, refining and marketing costs, the refining and marketing departments of the large companies, during the later years of this period, especially in 1919, made on the average much higher rates of profit on investment.

"From 1916 to 1920, a period of marked price advances, the wholesale prices of the large marketing companies for gasoline and engine distillate sold to garages and other resellers were practically uniform, as were also the retail prices at their own service stations."

#### Standard Group Dominant

In conclusion, the report, which was signed by all the members of the commission, read:

"This dominant position of the Standard group in the petroleum industry of the United States is due not merely to the magnitude of its various units with respect to production and capital investment, but also because of its solidarity, arising apparently from an interlocking stock ownership resting largely in the hands of a few great capitalists and from its great financial resources and credit."

## Optimism Prevails at Tractor Meeting

**All Manufacturers See End of  
Depression With 1922  
Prospects Good**

CHICAGO, Dec. 5—The members of the tractor and thresher department of the National Association of Farm Equipment Manufacturers (formerly the N. I. V. A.), who came here to attend the annual meeting of this section, left for their homes greatly encouraged for the prospects of 1922. It appears that each of these manufacturers came knowing that in his own business he had found very strong signs that the corner had been turned. He was wondering if the other manufacturers had found the same indications.

### Black Discusses Outlook

During the meeting it developed that all manufacturers believed that the deep depression of 1921 was past and certainly 1922 would be better. Both in the meeting and in the corridor talks there was every evidence of optimism.

The meeting devoted itself very closely to business affairs and the discussions were very generally participated in. The high points were discussion of a service plan; the Minneapolis Power Farming Show, and the Power Farm Bureau, on all of which definite action was taken.

The most impressive feature of the program was a paper on the "1922 Outlook" by William Black, president of the national association. Black discussed at length the conditions that had confronted the industry since the slump and pointed definitely to the influence that was certain to make 1922 a better year.

### Minneapolis Show to Be Held

The present status of the railroad situation was discussed exhaustively in the regular session by W. H. Stackhouse, and at the banquet by F. R. Todd. An interesting feature of this discussion was the report of the work that the committee of the national association is doing to assist in putting railroad rates and railroad management on a better basis, and the strong pleas in this regard that are being made to Congress.

It was evident from the discussion on the floor that there had been considerable criticism of the Minneapolis show plan. This was thoroughly discussed and a vote of confidence given to the show committee. J. B. Bartholomew, chairman of the committee, stated that he personally would solicit every tractor manufacturer, who is a member of the association, to put exhibits in this show. The manufacturers personally believed that the apathy of the Minneapolis dealers and public was due to a wrong impression that could be overcome.

Bartholomew was supported by Finley P. Mount and E. J. Gittins. Mount said that he was enthusiastically for the trac-

## TRUCKS PROVE SAVING IN COTTON SHIPMENTS

GRIFFIN, GA., Dec. 5—Cotton in this vicinity is being transported to domestic mills with the aid of motor trucks at an average saving of approximately \$1 per bale as compared with railroad freight charges, with the added advantage that deliveries are being made much more promptly.

tor show as planned, and he did not propose that any factory branch managers should "gum up" the proceedings. He said that possibly their own branch manager was one of these, but there must be a change of attitude, and so far as the committee was concerned, they were going ahead with the show even if they had to allot the space not taken to the exhibitors who had taken space. The meeting left no doubt that the show will be held as planned.

(Continued on page 1146)

## Paige-Detroit Subsidiary Formed to Make "Jewett"

DETROIT, Dec. 6—Jewett Motors, Inc., has been formed as a subsidiary of the Paige-Detroit Motor Car Co. to manufacture a six cylinder car to be called the Jewett which will sell in the light car, medium price class field.

The car will be first shown to dealers in the Hotel Commodore during the New York show week and the selling price and sales features will be announced at a dinner to be tendered Paige dealers by the company.

The car will be made in the Paige factories in Detroit but by an entirely separate working force and by a separate company. Officers of the new company are headed by H. M. Jewett, president of Paige-Detroit Co.

The Paige company has adopted a standard of practice which all its dealers will be advised to follow beginning at the time of introduction of the new car.

## American Rolls-Royce Enlarges Force at Plant

SPRINGFIELD, MASS., Dec. 5—Rolls-Royce of America, Inc., after operating on a limited scale for two months, is increasing its factory force from week to week and is now turning out two chassis a week. The machine shop is again in operation and the assembly force much enlarged. It is expected that the normal rate of four chassis a week will be reached by the first week of January.

S. De B. Keim, sales manager, reports gratifying results from the company's exhibit at the New York salon. The company is making deliveries for shipment to California and Florida and the winter resorts of Southern Europe.

## Government Moves in Lincoln Appeal

**Treasury Agrees to Give Immediate Hearing Relative to  
\$4,500,000 Tax**

DETROIT, Dec. 6—Officials of the Treasury Department at Washington have agreed to give attorneys for the Detroit Trust Co., as receiver of the Lincoln Motor Co., an immediate hearing on its appeal from the \$4,500,000 additional tax imposed after an adjustment by the War Department. The hearing will follow the completion of the inventory and its appraisal this week. Until something definite is learned of the course which will be followed by the Treasury Department, the receiver will be compelled to hold in abeyance any plans he may have for reorganization. It is expected it will be possible to hold a creditors' meeting by Dec. 20, and that date has been tentatively set.

### Reorganization Delayed

When the details of the inventory and appraisal are presented to the Federal court the receiver will recommend that operations be continued. The outlook for business is regarded as favorable and models now are being built for the New York and Chicago shows. They will follow new lines in body work.

No serious attempt at reorganization can be made while the Government claim is pending. When it was originally filed several months ago the bill was for \$5,700,000 but this was reduced by \$1,200,000. Filing of this claim prevented the company from putting through any re-financing plan and was one of the reasons for the receivership.

### Mortgage as First Lien

It is contended that unless the government succeeds in establishing the tax claim as a prior lien, which is considered improbable, the mortgage against the plant will come first. The majority members of the board of directors who forced the receivership own a large part of the \$1,250,000 in bonds outstanding and are joint endorsers with Henry M. Leland and his son of \$4,000,000 in bank notes. The Lelands had their entire fortune invested in the company and this is regarded as practically lost.

There are approximately 2000 owners of the \$8,000,000 in class A stock. The Lincoln Motor Co. holds 15,165 shares. The largest individual holder is George F. Fuller of Worcester, Mass., who owns 4550 shares. Sybil H. Fuller owns 3000 shares. Fred T. Murphy, William H. Murphy and Mrs. Rebecca Murphy together own 5400 shares.

### NEWFOUNDLAND AIR SERVICE

ST. JOHN'S, NEWFOUNDLAND, Dec. 5—The Newfoundland Government has inaugurated an aerial mail service between St. John's and Halifax with North Sydney as a port of call.

## 19,645,248 Casings Made During Year

Output of Inner Tubes Aggregates 24,417,229 and of Solid Tires, 377,823

NEW YORK, Dec. 5—Production of pneumatic casings by the tire manufacturers who are members of the Rubber Association of America, which means approximately 97 per cent of the total production in the country, was 19,645,248 for the calendar year ended Oct. 31. Shipments for the same period totaled 22,133,940. The excess of shipments over production was taken from the stocks in storage which stood at 5,170,920 at the end of November 1920 but which had been reduced at the close of October last to 3,545,030.

### Shipments Exceed Output

Production of inner tubes for the calendar year totaled 24,417,229 while shipments were 26,292,718. This excess also was taken from the stocks on hand which had been reduced at the close of October to 4,732,016. Solid tire production aggregated 377,823 and shipments 530,897.

Production of pneumatic casings in October amounted to 1,928,271 and was almost identical with the production in September, when the total was 1,929,268. There was a sharp falling off in shipments in October, however, the total being 1,675,169 as compared with 2,047,929 in September. Shipment figures were the lowest since March, when they were 1,614,651. Inner tube production fell off from 3,274,828 in September to 2,843,918 in October. Shipments, however, were 2,016,371 as compared with 2,645,758 the previous month.

### Statistics of Industry

The detailed figures for the year by months as compiled by the rubber association for the Bureau of Foreign and Domestic Commerce, follow:

PNEUMATIC CASINGS			
1920	Inventory	Production	Shipments
Nov. ....	5,170,928	915,651	1,262,159
Dec. ....	5,508,380	506,111	1,327,153
1921			
Jan. ....	5,319,605	703,430	965,417
Feb. ....	5,193,018	819,892	1,073,756
Mar. ....	4,597,103	1,163,314	1,614,651
Apr. ....	4,527,445	1,651,418	1,785,951
May ....	4,451,668	2,100,917	2,085,882
June ....	4,154,456	2,313,265	2,643,850
July ....	3,892,037	2,570,524	2,757,581
Aug. ....	3,934,583	3,043,187	2,894,442
Sept. ....	3,340,798	1,929,268	2,047,929
Oct. ....	3,545,030	1,928,271	1,675,169
INNER TUBES			
1920	Inventory	Production	Shipments
Nov. ....	5,480,354	1,002,886	1,366,977
Dec. ....	5,786,929	508,446	1,481,285
1921

Oct. ....	4,732,016	2,843,918	2,016,371
SOLID TIRES			
1920	Inventory	Production	Shipments
Nov. ....	294,043	23,299	36,628
Dec. ....	303,473	16,297	40,828

## TIRE FREIGHT RATES CUT TO WEST COAST

NEW YORK, Dec. 5—The traffic committee of the Rubber Association of America announces that as a result of negotiations which have been carried on for some time the westbound freight rate on tires to the coast has been reduced more than 30 per cent.

The carriers have agreed to establish a rate of \$2.75 per 100 lbs. from eastern shipping points to Pacific Coast ports reached by water lines, Los Angeles to Seattle inclusive, to meet water competition through the Panama Canal.

It will be necessary to submit this proposal to the Interstate Commerce Commission and for that reason it is impossible to state the exact date upon which the new rates will become effective.

1921			
Jan. ....	303,753	21,220	29,116
Feb. ....	304,374	23,355	29,599
Mar. ....	283,800	28,710	43,926
Apr. ....	269,985	28,859	42,080
May ....	264,633	35,156	40,122
June ....	240,336	28,395	49,867
July ....	220,003	35,123	55,678
Aug. ....	216,367	55,694	66,866
Sept. ....	161,832	37,441	50,276
Oct. ....	163,299	46,274	46,911

"Production" and "Shipments" figures cover the entire month for which each report is made. "Inventory" is reported as of the last day of each month.

"Inventory" includes tires and tubes constituting domestic stock in factory and in transit to, or at, warehouses, branches (if any), or in possession of dealers on consignment basis, and as a total represents all tires and tubes still owned by manufacturers as a domestic stock.

"Shipments" include only stock forwarded to a purchaser and does not include stock forwarded to a warehouse, branch, or on a consignment basis, or abroad.

## International Wheel Preparing to Produce

TORONTO, Dec. 5—The Syndicate of Toronto, Montreal and Hamilton capitalists which has formed the International Wheel & Rim Co., Ltd., to manufacture a double disc steel automobile wheel under the Culp and Crenan patents is making arrangements to get into production.

Dies for the wheels as well as for the new Culp demountable rim are being made. Joseph N. Crenan is president and general manager of the company. He states that he has orders for a number of test wheels from several Canadian car manufacturers as well as from most of the Canadian jobbers.

### U. S. RUBBER HAS NEW TUBE

NEW YORK, Dec. 5—A new inner tube has been placed on the market by the United States Rubber Co. It will be sold under the name of Royal Tube and will be of the same general quality as the Royal cord tire. Improvements in construction are said to give the tube increased life and greater adaptability to repair work.

## Tire Outlook Good, Seiberling States

Says Industry Has Passed Turning Point and Is on Up-Grade

AKRON, Dec. 5—"Business has quite definitely turned the corner, but prosperity waits on the restoration of the buying power of America's greatest commercial asset—the farmer," states F. A. Seiberling, president of the Seiberling Rubber Co. of Akron.

He believes the automotive industry, in the last analysis, is dependent upon the farmer, and the prosperity of the farmer, saying, "For not only is he the biggest buyer of automobiles himself, but the trade he creates means automobiles and motor trucks for other people. But the farmer cannot buy automobiles on 'dollar wheat' that costs him 50 cents or more to get to the market."

### Improvement to Be Steady

The tire industry, according to Seiberling, long since has passed the turning point and is steadily on the upgrade. Stocks have been largely absorbed, he explained, and the business to-day is as near sound readjustment as any basic industry in the country.

"Consumption of tires in 1922 is certain to be greater than that of the present year, and the industry will experience a steady increase following the improvement in general business and the expansion of the automobile trade," he adds.

Seiberling believes the improvement in business will not be rapid, but steady, and that it will not jump straight up from "low" to "high." He says the world will never be able to get away from rubber as a material in the construction of tires. Rubber supplies, he states, are abnormal at present. There is more than a year's supply of rubber now on hand in the United States, he estimates. Prices of tires are in proper adjustment with the prices of raw materials.

## American Bosch Program Launched at Conference

SPRINGFIELD, Dec. 5—For the purpose of launching a broader sales campaign in respect to its new automotive products, the American Bosch Magneto Corp., called its branch managers and district salesmen from New York, Chicago and Detroit into conference here.

Alfred H. Bartsch, general sales manager, led in a discussion of plans for appointing new representatives in various cities and otherwise extending sales and service. These arrangements follow the plan of maintaining close relations with all the dealers, with a view to expanding the production and use of devices now being introduced, comprising magneto fittings, impulse couplings, starting motors, generators, battery ignition systems, and numerous small accessories.

## Two Plans Favored in Used Car Problem

### Manufacturers Would Act on One Proposal; Dealers Would Support Other

NEW YORK, Dec. 5—The survey made by the National Automobile Chamber of Commerce in the hope of finding some definite means of solving the used car problem shows that two definite plans seem to be most favored by automobile dealers. The first of these would be acted upon by the manufacturers and the other would be supported by the dealers. The proposals are:

1.—Each manufacturer, in advertising his new cars, to advertise also the market price of his older models.

2.—Dealers in each locality to authorize one or more public appraisers similar to real estate appraisers who for a fee paid by the dealer will give the sales value of any car submitted by dealer or customer.

#### Would Advertise Prices

In explaining these plans in an address before the Washington, D. C., Automotive Association, the following explanation was made by Alfred Reeves, general manager of the N. A. C. C.:

"Under the first plan the manufacturer will advertise the sales price of his older models in good condition, based upon reports from around the country. It should not be necessary to give values of cars less than 18 months or more than four years old.

"The plan would give some protection to the new car dealer because a customer could hardly ask for a greater allowance than he knew could be obtained for his used car. Any dealer exceeding this allowance would do it with the knowledge that he is inviting a loss which loss he is apt to take by promptly selling the car at the known sales value. This plan it is felt would increase respect for the second hand car.

#### Provides for Appraisers

"Under the second plan, the dealers in each locality would appoint a certain number of appraisers to appraise second hand cars offered in trade. These men at proper quarters, with experts, would judge the condition of the car and issue a certificate to the owner giving a value that would be recognized by all dealers.

"The dealers would pay a fee of \$2 or more to the appraiser, who would be entirely independent of any particular dealer. He would be appointed for his ability. Just as certain real estate appraisers are recognized by real estate firms.

"Such a plan would give dealers a true knowledge of the value of the car. Of course, nothing could prevent any dealer from allowing a sum in excess of the appraised valuation, but in so doing he would be incurring a loss with his eyes open. Customers, as a rule, expect the dealer to make a fair profit. Owners of used cars, unfortunately, overestimate their value and where there is no official appraisal in opposition they are generally good enough salesmen to sell the dealer a car for more than its worth.

"No matter what plan may be finally approved by manufacturers and dealers, the fact remains that the used car problem will

continue to be a menace until the dealers learn enough about values to buy second hand cars enthusiastically, for a profit, and not with depressed spirits at prices which they know are certain to involve a loss. I can think of no better slogan to help the used car problem than for everyone concerned to 'buy them right'."

Reeves contended that the real fundamental in the solution of the problem is to take in the used car at the right price, "which means a price that will enable it to be sold at a profit."

## Battery Stockholders Decide Reorganization

HAMMOND, IND., Dec. 5—On petition of the Indiana Box Co., East Chicago, a receiver was appointed in the Superior Court here for the OK Giant Battery Corp. The claim of the petitioner was for about \$300 for shipping boxes for batteries. At the same time the order for a receiver was entered the court ordered the sale of the battery plant for delinquent taxes setting the sale for Dec. 3. A restraining order was secured by some of the stockholders and the sale was stopped.

Previously twenty-five of the battery company stockholders held a meeting at which it was decided to reorganize the company, the plan including the appointment of a stockholders' committee to take charge of the plant as soon as the receivership is ended. A. G. Slocum, former secretary of the OK Battery Corp., is receiver.

## Lay Reorganization Plans for Kelley Tire Company

HARTFORD, CONN., Dec. 5—Plans for the reorganization of the Kelley Tire & Rubber Co. have been started through Edward Newman, a New York lawyer, who heads a group of stockholders and the law firm of Holden & Peck of the stockholders' committee. Receiver A. H. Barclay of New Haven is not yet ready to announce the plan but states that negotiations are in progress.

It is said that the stockholders are to buy bonds of the company and receive a bonus in preferred stock but that all stockholders will receive an allotment of common stock whether or not they go into the refinancing plan.

## November Sales Remain Steady in New Orleans

NEW ORLEANS, Dec. 5—Leading automobile dealers here say that sales for November have held up well, especially during the first three weeks of the month. The fourth week was somewhat slack with prospective purchasers more inclined to talk of waiting until the first of the year.

New cars have been in better demand than used automobiles. The latter continue to move slowly and the supply on hand still appears ample to preclude possibility of any notable early improvement in that line.

## Bock Bearing Plant Is Profitable Unit

### Economy Program of Standard Parts Does Not Consider Its Sale

CLEVELAND, Dec. 6—There has been outlined for the Standard Parts Co. a program of economy that in operation under the administration of receiver Frank Scott has resulted in the payments of dividends of \$2,000,000 to creditors within a short time, and has put the company in an excellent condition for the future.

A part of this economy program is the sale of certain plants, a series of consolidations, rearrangements of plants and changes in the methods of handling material. The program for sales of plants that are a part of the \$20,000,000 parent corporation that is engaged in the manufacture of automobile accessories and parts became known here to-day.

#### Bock Not Sold

Some time ago a small establishment 2½ miles distant from the main plant of the Bock Bearing Co. at Toledo was sold. This gave rise to the report that the Bock Bearing plant, a unit of Standard Parts, had changed hands, but this was denied at general offices of Standard Parts here. It was said the Bock Bearing plant is one of the most profitable units of the parent concern, that it has not been sold and that it is not for sale. In the small plant that was sold but a single operation was performed and it was disposed of under the general economy plan.

The American Ball Bearing Axle plant in this city is for sale, while the forge plant at Canton has been sold, pending confirmation of the court, and the plant of the Spring Co. at Canton is on the market. The work that was done in the Spring plant at Canton has been transferred to the Perfection Spring plant in this city and a considerable saving has been effected.

The Hess-Carphage Axle plant at Cincinnati also is for sale. It will be disposed of as a going concern. When the plants that are on the market are disposed of the Standard Parts will have as remaining units the Perfection Spring Co., the Eaton Axle Co., Standard Welding Co., Bock Bearing Co. and the Spring service stations at New York City, Boston and Cleveland, as well as the Pontiac Spring Co.

#### G. M. BUILDING READY JUNE 1.

DETROIT, Dec. 6—General Motors will begin work to complete finishings on its office building here soon after the first of the year. By June 1 it is hoped to have the entire structure ready for occupancy. Most of the interior work remains to be done on the west wing. Decision to complete the building came in connection with the recent sale of \$12,000,000 bonds.

# REACH AGREEMENT IN WILLYS ACTION

## Plan Satisfactory to All Interests

### Provides for Retention of Miniger as Receiver—Kennison Kept in Ohio

(Continued from page 1136)

Judge Bodine will be asked to reappoint Miniger to co-operate with the other two receivers already designated by him. It was agreed at the conference that this plan would be appropriate because it would assure the other receivers the benefit of Miniger's long and successful experience as a manufacturer in their attempt to solve the problems growing out of the big new plant of the corporation at Elizabeth where the Chrysler six was to have been built.

#### Bankers Attend Conference

The conference yesterday was attended by representatives of the Chase National, Chemical National, New York Trust and Equitable Trust of this city as well as by attorneys for the bank creditors' committee. Other banks which sent representatives were the First National of St. Louis and the Merchants' Loan & Trust Co. of Chicago. The receivers and interests in Ohio were represented by Toledo attorneys. Willys attended personally with his counsel. James P. Cotton represented the first preferred stockholders, Littleton Fox the second preferred stockholders and Col. J. M. Hartfield the merchandise and construction creditors.

A statement in behalf of the bank creditors' committee was made after the conference by J. A. Bower, vice-president of the New York Trust Co. He said there were sufficient assets to meet all claims against the Willys Corp. and he emphasized the fact that the Willys-Overland Co. is not involved financially by the receivership.

#### Has Many Assets

It was pointed out by Bower that the Willys Corp. has a large amount of assets to cover its obligations which have been estimated at between \$10,000,000 and \$14,000,000. One of them is the Elizabeth plant which is valued at \$8,000,000 and rated as one of the finest production plants in the world. Other valuable assets are the New Process Gear plant at Syracuse and the Electric Auto Light plant at Toledo with various smaller companies. The Willys Corp. also holds 33 per cent of the stock of the Willys-Overland Co. and several million dollars' worth of stock in the Fisk and Federal rubber companies. These stocks are said to approximate \$20,000,000.

A statement made by Alfred A. Cook attorney for the New York Trust Co., said:

"Every interest is desirous of the carrying out of the program of amicable adjustment. There are plenty of assets to cover all liabilities and all of us wish to correct the erroneous impression that the Willys-Overland Co. is affected. Willys-Overland is solvent and sound."

Definite plans have not yet been evolved for the straightening out of the difficulties of the corporation. The Elizabeth plant is the only unproductive unit and it is considered certain that an effort will be made to sell this property. The New Jersey receivers announced Saturday that they would attempt at the earliest possible moment to get rid of it and that the first chance to buy would be given the bank creditors. The "peace conference" may modify this plan in some respects but not the determination to get rid of the Elizabeth property. All Willys interests feel that beyond the sale of the Elizabeth factory there should be no dismemberment of the corporation and that the various other plants should be operated under its direction.

#### U. S. Light Not Involved

A statement has been issued by the United States Light & Heat Corp., Niagara Falls, asserting that it is not involved in the receivership and that the only connection between it and the Willys Corp. is that its preferred stock is owned by the Willys Corp.

Sale of the Elizabeth plant would make it possible to apply the earnings of the Electric Auto-Lite Corp. and the other producing companies to the liquidation of the obligations. Up to this time half the earnings of Auto-Lite have been used in paying for the maintenance of the big factory in New Jersey where a skeleton organization had been maintained in the expectation of beginning production in the near future on the Chrysler car.

The amicable agreement which has been reached is expected ultimately to result in payment of all debts and the preservation of substantial equities for the various classes of stockholders through reorganization and refinancing under the receivership.

## Union Insurance Acquires Motor Mutual Indemnity

KANSAS CITY, Dec. 5—J. B. Sackett, President of the Union Insurance Co. of Wichita, Kan., announces that he and his associates have taken over the Motor Mutual Indemnity of Kansas City and will move its home office to Wichita. It was organized in November, 1920, but has done almost no business.

It is the purpose of the new management to write fire and theft insurance on automobiles at manual rates and accept as assured only members of the Anti-Automobile Thief Association of America.

## Cooperation Urged by Court in Newark

### Willys Files Affidavit Setting Forth Steps Which Led to Action

(Continued from page 1136)

Illustration that Messrs. Kennison and Miniger be retained with him."

In his affidavit, Willys also set forth that he and his family owned approximately 80 per cent of the common capital stock of the company. This represented property and securities contributed to the corporation by him worth more than \$14,000,000 when the former Electric Auto-Lite Corp. became the Willys Corp.

#### Willys Sought Harmony

"During the past eight months," the affidavit went on, "efforts have been made to which I have lent all the assistance in my power, to bring about an agreement, but it has proved impossible to reconcile the various conflicting interests."

The banking group's reorganization plan was abandoned early in November, he said, and to save the situation, he proposed the staving off of a receivership by putting liquidating power in the hands of a representative committee. This the bankers would not accept, he claimed.

"The only counter suggestion," the affidavit proceeded, "was that the Auto-Lite and New Process Gear plants be transferred at once to subsidiary corporations so as not to be affected by a receivership. This might violate restrictions governing first preferred stock and cause serious liabilities for the directors without the consent of 75 per cent of the first preferred stock, which it was not practicable to obtain. With no plan of reorganization in sight, the affairs of the corporation were left in a truly desperate position."

#### Agreed on Receivership

"My information was that some individual shareholder was trying to precipitate some form of receivership, and a possible receivership in creditor's action was also mentioned."

"I was informed the bank creditors were investigating the question of auctioning off component units of the enterprise, a program which, if carried out, meant disaster to all classes of stockholders. This latest circumstance undermined my confidence and the confidence of other directors in regard to receiving further co-operation from the bank creditors' committee in preserving the enterprise."

Then followed information on the directors' decision at a regular adjourned meeting to accept a receivership.

"The plan of receivership," said Willys, "reflected the conscientious convictions of myself and the other directors that we should accept the protection of the court."

"The chief function of the receivership in

(Continued on next page)

## Urges Cooperation in Willys Action

### New Jersey Court Acts—Affidavit Pertaining to Receiver- ship Filed

(Continued from preceding page)

the New York jurisdiction," the affidavit ran on, "will be to take custody of stocks and securities. By the force of circumstances, the most important business activities of the defendant will be in its manufacturing operations at Toledo. Therefore, there was no impropriety in the directors consenting to the primary jurisdiction taken by Toledo.

"The ultimate payment of all debts is assured, and that all shareholders have substantial equities to preserve is established beyond doubt by the great value of the treasury assets and the earning power of the Auto-Lite and the New Process plant, without considering the other large investments. A reconstruction value of \$10,000,000 was recently placed upon the Elizabeth plant."

#### Refutes Aspersions

The affidavit next presented information relative to the 739,000 shares of Willys-Overland stock held by the Willys Corp. This stock has a book value of \$18 a share, exclusive of goodwill, it was stated, and an end of business depression would make this asset equal four-fifths of the corporation's total debts.

Willys then asked the privilege of refuting certain aspersions.

"I was never a stockholder nor officer nor director of the Ohio Savings Bank & Trust Co., and I am not a borrower there and have no personal dealings. I have no influence over it. In fact, I failed to persuade it to join the bank creditors' committee.

"The allegation that the majority of the directors of the Willys Corp. and of the Willys-Overland Co. are dominated and controlled by me does an injustice to the officers of the companies. I suggested Miniger for receiver with no thought to dominate, and he would not stand for domination anyhow, but I believed it proper that the operating head should be named.

#### Judge Indorses Receivers

"His name was suggested for the reason that it seemed entirely natural, proper and customary that the man at the head of the largest income producing operating unit of the defendant should become the operating receiver.

"I have no business or personal relation with Kennison, having met the gentleman less than half a dozen times in my life. I urgently requested that Judge Killits be asked not to appoint a second receiver until after all committees and other interested parties had been notified, but the court declined to appoint an operating receiver alone and named Kennison as his own selection."

Willys told of the sale of Willys-Overland stock to the Willys Corp., pointing out the care with which the transaction was made, and he remarked: "There is nothing in the transaction upon which any personal liability on the part of the directors who participated in it can be predicated."

A letter from Judge Killits endorsing Kennison and Miniger, which was read to Judge Bodine by their counsel, Thomas

H. Tracy, was addressed to Federal Judge Hough, who had been expected to handle the case in New York, and was as follows:

"I am sending this by Messrs. Miniger and Kennison, whom I appointed receivers for the Willys Corp., and am glad to have the opportunity to thus make you acquainted with each of these gentlemen. Miniger has been for a long time the successful administrator of the affairs of the defendant and is competent in every conceivable way to administer the estate for the court from an operating and marketing end of the business.

"I deemed it best to appoint two receivers because of the magnitude of the business of the corporation and the diversity of interests to be represented, and selected of my own choice Kennison as the second receiver. I have known him for a long time as favorably as I have known Miniger and have every confidence in his capacity to faithfully serve the court in this position. He has no connection whatever with the Willys Corp. For a long time he has been closely identified with banking and commercial matters in this city."

Affidavits were presented on the ability and character of Kennison and Miniger, along with a letter from Judge Killits attesting that Kennison had been his personal choice for receiver, and that Kennison had no connection with Willys.

#### Repudiation "Almost Criminal"

"This company," declared Conover English, associated with Tracy, "is successful in Ohio, and the man who has made this possible was Miniger. Judge Killits may feel that if his receivers are repudiated, he should shut down on money for the New Jersey plant. There should be a close connection between Toledo and New Jersey."

"It would be almost criminal," remarked Judge Bodine, "to throw out an experienced operating man where a plant is operating, but we don't have any operating problem in New Jersey."

## Predicts 50 to 100 Miles on Gallon of Gasoline

DETROIT, Dec. 6—Fifty to one hundred miles per gallon of gasoline is a development in the motor car industry not far removed, according to C. F. Kettering, president of the General Motors Research Corp. and vice-president of the General Motors Corp. He made the assertion in an address to "Gold Medal Men" of the Cadillac Motor Car Co. at a dinner at the plant last evening. Gold medals were presented to 81 men employees and gold rings to four women employees, all of whom have been with the company 10 years.

"Increased mileage will come about through a change in the method of refining gasoline," Kettering said. "We know there now is a constructive attitude on the part of the oil companies to refine oil along the right lines. It is possible to-day easily to double the mileage and when this has been done a lot of trouble with the automobiles will be solved, such as elimination of carbon.

"The use of gasoline was more or less accidental," Kettering explained. "No one asked if it was the right thing for the motor car. It was the nearest thing at hand. Gasoline was then simply a by-product almost to be had for the asking."

## Planning for Show Week in New York

### Various Organizations Set Dates and Places for Annual Meetings

NEW YORK, Dec. 5—With interest in the coming New York show keener than ever before, the national organizations of the automotive industry with headquarters here are making unusually elaborate preparations for the week, which is the busiest of the year for them. The number of exhibits at the show itself will establish a new record and an unusually large number of announcements which will be important to the trade are expected.

#### Arrange For Dinners

Preliminary arrangements are well under way for the annual dinners to be held during the show. The Rubber Association of America will dine at the Waldorf Monday evening, Jan. 9. The first dinner of the Old Timers' Association will be held the same evening. The dinner of the National Automobile Chamber of Commerce will be held at the Commodore on Tuesday evening, that of the Motor and Accessory Manufacturers' Association Wednesday at the same hotel and the banquet of the Society of Automotive Engineers at the Astor, Thursday evening.

#### Meeting Dates Set

The annual meeting of the Rubber Association of America for the election of officers will be held at the Waldorf Monday afternoon. The annual meeting of the M. A. M. A. will be held at the Commodore Wednesday afternoon. The directors of the N. A. C. C. also will meet Wednesday. A large number of more or less incidental meetings of dealers and committees will be held during the week. It is probable manufacturers will devote more than the usual amount of attention to arousing greater interest among dealers.

#### Show Roster Changed

NEW YORK, Dec. 6—Several changes have been made in the past few days in the roster of exhibits at the New York and Chicago automobile shows. The Jackson Motors Corp. of Jackson, Mich., will exhibit only at Chicago and the William Small Co. of Indianapolis, which makes the Monroe car, has withdrawn from both shows. This places the total makes of cars to be displayed at New York at 92 and the figure for Chicago is 80.

The show management has been informed that the New York dealers propose to make the exposition this year a "selling show" and they are making plans to take prospects in large numbers to the Grand Central Palace. The color scheme of the decorations this year will be purple and gold with purple predominating.

## Naming Field Force for Rickenbacker

### Eighty Distributors Will Be Appointed on Five-Year Contracts

DETROIT, Dec. 7.—Distribution of the new Rickenbacker car will be through a strong distributor organization working upon a five-year contract with the factory. By March 1 distributors will have been named in 25 to 30 leading centers of the United States and additional territories will be allotted as fast as production at the plant permits.

#### Dealers to Be Protected

In determining upon the five-year contract as the basis of its sales relationships, Captain E. V. Rickenbacker, vice-president and director of sales of the company, said he regarded it as the only equitable basis upon which a substantial dealer should be asked to operate. Because of the long tenure of the contract, Rickenbacker said, great care would be exercised by the company in naming its representatives, which accounted for the apparent delay in announcing its sales organization.

Under the contract no dealer can either forego his obligations or be removed by the factory except for cause. Every dealer will be protected against loss through price reductions by a special clause guaranteeing against this. Territorial lines will be strictly drawn and enforced.

#### May Handle Other Lines

No dealer will be required to handle the Rickenbacker line exclusively, the only obligation in this respect being that he handle no other car in the general class of the Rickenbacker. By handling two or more non-conflicting lines, Rickenbacker declared, a dealer can make substantial reductions in his overhead and a competent dealer, he said, can handle several lines with equal fairness to all.

The company is carefully considering the used car problem, but it is considering it from the angle of the dealer who has been successful in meeting and profiting by accepting trade-ins.

Distributors in New York, Boston, Philadelphia and Chicago will be named before the first of the year and distributors in other main centers will be added from time to time until March 1. When fully organized the distributors will number about 80, Rickenbacker said. These will be expected to handle a production of 12,000 to 15,000 cars in 1922.

## Hanson to Manufacture New "Little Six" Car

ATLANTA, Dec. 6—George W. Hanson, president of the Hanson Motor Co. of Atlanta, announces that the company will shortly start the manufacture of a new model to be known as the Little

## FORD PROVING METAL CURRENCY NOT NEEDED

DETROIT, Dec. 8.—To prove his contention that metal currency is not necessary to carry on the commerce of the world, Henry Ford is understood to be establishing a "food products bureau" which will enable farmers to exchange the products of the soil for Ford cars, trucks and tractors. Under the plan as it is being worked out, it is understood, Ford dealers will be authorized to barter directly with farmers, taking produce at its current market price. The dealers in turn can use this produce to pay the Ford company for motor vehicles.

Six. It will have a 112-in. wheelbase and will be a companion car to the present line of Sixes manufactured by the company.

While no definite price has been announced for the new model, it is said that it will list for less than \$1,000 and be the lowest priced six-cylinder car on the American market. The new car will first be shown, Hanson stated, at the New York and Chicago shows, and then at the Atlanta show.

## 26 Companies Included in Automotive Merger

NEW YORK, Dec. 7.—Substantial progress has been made in the last few weeks in negotiations for the formation of the big automotive merger which will be known as the Associated Motor Industries, a Delaware corporation with a capital of \$80,000,000. The roster of companies which will be included now contains 26 names, embracing established companies not only in the parts field but in the passenger car and truck branches of the industry. One of the purposes of the merger will be to assure the parts companies included, a definite amount of business each month through the sale of the motor vehicles which will be controlled by the parent company.

Promoters of the enterprise assert that ample financial backing has been obtained to insure the success of the enterprise and declare negotiations now have reached a point where the merger can be called an actuality. One of the cardinal points in the merger plan is a scheme for financing dealers in its products and those who purchase them.

#### CORBITT ANNOUNCES PRICES

HENDERSON, N. C., Dec. 6—Corbitt Motor Truck Co. has announced the following prices on its 1922 models: H, 1-ton, \$1,400; E, 1½-ton, \$2,200; C, 2-ton, \$2,600; B, 2½-ton, \$3,000; R, 3-ton, \$3,200; A, 3½-4 tons, \$3,800; AA, 5-ton, \$4,500.

## Inventories of Reo Reduced 50 Per Cent.

### Olds Reports Company Enjoyed Unusually Profitable Year Despite General Conditions

DETROIT, Dec. 7.—The plant and branch inventories of the Reo Motor Car Co. totalling \$12,484,152.52 on Aug. 31, 1920, are shown to be reduced about 50 per cent by the statement issued as of Aug. 31, 1921. Inventories of the current year are placed at \$6,556,044.15, based on market values as of the August date.

President R. E. Olds sums up the outstanding features of the year's operation in a statement accompanying the financial report, declaring the company to have enjoyed an unusually profitable year notwithstanding the conditions prevailing in most other lines of business.

Surplus \$9,785,666.57

The company has in cash, drafts in transit and Government bonds, \$3,255,968.46. Notes and accounts receivable of \$2,823,078.49 are shown to offset current liabilities of \$1,196,280.38. The ratio of current assets to current liabilities is shown to be six to one. The company has no bonds or preferred stock and has no fixed interest charges. Net profits for the fiscal year total \$1,022,232.31 and after cash dividends of \$693,725 there is a surplus of \$9,785,666.57. The common stock is shown to have a book value of \$24.10 a share.

#### Percentage Increase Large

Referring to the volume of business done during the year, Olds said though this was less than for 1920, the percentage of normal has been much larger than the general average of the industry.

## N. A. C. C. Directors Vote to Continue Tax Program

NEW YORK, Dec. 8.—Directors of the National Automobile Chamber of Commerce decided yesterday to continue their tax program for another year with the hope that it will result in the elimination of burdensome excise taxes.

Further consideration was given to suggestions made to the National Automobile Dealers Association for contract changes and it is expected a definite report on this subject will be sent out soon.

The directors made a further survey of the used car problem and a report on investigations which has been made is expected in a fortnight.

In their discussion of business conditions, the directors pointed out that practically all companies have adopted a conservative program for the winter and that no definite plans for the next year will be made until after the New York and Chicago shows, although many companies have gone to the market for the purchase of supplies on a moderate scale.

## N. A. C. C. Opposes Overloading Trucks

### Directors Endorse Committee Resolution—Overspeeding Is Also Condemned

NEW YORK, Dec. 7—Directors of the National Automobile Chamber of Commerce at their meeting here to-day went on record unanimously as opposed to the overloading and overspeeding of motor vehicles. This action was taken in reference to the ruling made by highway and motor vehicle authorities in the State of Connecticut that any person desiring to register a commercial motor vehicle for an increase over its load capacity must obtain from its engineering department a certificate to the effect that in the opinion of the manufacturer such vehicle is capable of being safely operated under all conditions when loaded to the increased capacity.

#### Certificate Giving Dangerous

The resolution in reference to this proposal, which was adopted by the motor truck committee of the N. A. C. C. at a meeting yesterday and then by the directors to-day, follows:

*Whereas*, The National Automobile Chamber of Commerce has consistently opposed the overloading and overspeeding of motor vehicles for the safety of the public, the protection of the investment of the operator, and the protection of the reputation of the manufacturer, and

*Whereas*, The National Automobile Chamber of Commerce is convinced that it must continue to oppose the overloading and overspeeding of motor vehicles for the protection of the public highways over which such vehicles operate, and for the protection of the motor vehicle industry against restrictive legislation practically prohibiting the economic operation of motor vehicles—particularly the operation of trucks engaged in the transportation of people and product, and

*Whereas*, certain states have enacted laws permitting the registration of motor vehicles with a carrying capacity in excess of the manufacturers' rated carrying capacity upon the production of a certificate from the manufacturer that such motor vehicle can be "SAFELY OPERATED" "UNDER ALL CONDITIONS" "AT ALL TIMES," and some manufacturers have given such certificates, and

*Whereas*, it is the conclusion of the National Automobile Chamber of Commerce that the giving of such certificates authorizing the carrying of loads in excess of the rated carrying capacity of such motor vehicles, under the conditions of such laws, is dangerous because of first: contingent liability on the manufacturer in case of accident, both personal liability and property damage; second, claims under the manufacturer's warranty for breakage and defects resulting from overloading authorized by such certificates; third, for the far more important reason that the acquiescence of motor vehicle manufacturers to overloading will be immediately seized upon by legislators as a basis for further restrictive legislation and higher license fees, and will immediately deprive the manufacturers of the co-operation of the Bureau of Public Roads of the Department of Agriculture, the State Highway Commissioners and public road officials, in their attempt to reach a practical solution of the highway problem in its relation to motor vehicle transportation; and fourth, the granting of certificates by manufacturers permitting overloading violates not only every engineering and manufacturing principle, but every principle of clean, competitive selling, and can only result in misunderstandings and sales resistance, as having once departed from a national understanding and enforcement of the manufacturers' rated carrying capacity, there is no limit on overloading that can be accepted as a standard.

*Now, therefore, be it resolved*, that the National Automobile Chamber of Commerce hereby reaffirms its policy of being unalterably opposed to overloading and overspeed-

## Shipments Show 9 Per Cent Gain Over Last November

NEW YORK, Dec. 7—Reports of November shipments of passenger cars and trucks as compiled by the National Automobile Chamber of Commerce show that they exceeded by 9 per cent the total for the same month of last year. It was the first month to show a gain over last year.

Another cause for gratification is the fact that November shipments declined only 21 per cent from the October total, while last year November shipments were 27 per cent less than for October. The shipment figures by months for this year and last follow:

	Carloads		Driveaways		Boat	
	1920	1921	1920	1921	1920	1921
January	25,057	6,485	29,283	3,185	....	93
February	25,505	9,986	43,719	7,507	....	99
March	29,326	16,287	57,273	9,939	....	75
April	17,147	20,187	64,634	14,197	....	1,619
May	21,977	18,608	74,286	15,193	....	2,381
June	22,516	20,269	60,746	18,834	8,350	3,947
July	23,082	19,470	52,342	15,320	8,702	3,725
August	23,386	20,350	34,060	14,290	7,095	3,565
September	20,804	20,150	24,431	13,550	5,469	3,580
October	17,209	17,323	14,127	11,257	2,519	2,300
November	13,253	14,061	9,467	10,509	659	1,385

ing of motor vehicles and that it condemns the practice of giving certificates authorizing the loading of motor vehicles beyond the manufacturers' published rated carrying capacity, and urges its members to discontinue the granting of such certificates, and be it

*Further resolved*, that the National Automobile Chamber of Commerce continue to co-operate with the Bureau of Public Roads of the Department of Agriculture, the State Highway Commissioners, and other public road officials, in stamping out the overloading and overspeeding evil for the safety of the public and the protection of motor vehicle transportation over the highways, and be it

*Further resolved*, that a copy of these resolutions be forwarded to the Bureau of Public Roads of the Department of Agriculture and the National Association of State Highway Officials.

The motor truck committee adopted another resolution suggesting to Highway Commissioner Bennett and Motor Vehicle Commissioner S. Toeckl of Connecticut that they rescind their ruling and adhere strictly to the text of the State law.

## Optimism Prevails with Tractor Makers

(Continued from page 1140)

Gittins was on the program for a paper on "Terms." His position was that during the good selling years a very satisfactory standard of terms had been put into force. His fear was that, now that selling was again highly competitive, terms would be given less consideration.

Bartholomew made an emphatic announcement that his company would continue on a strictly cash basis.

Mount and George M. Gillette were among those who advocated shorter terms. It was decided to appoint a committee to make suggestions in this regard.

The following officers, more of whom were re-elected, were named for the coming year: Chairman, Finley P. Mount; vice-chairman, George M. Gillette; secretary-treasurer, Edwin C. Merwin. The executive committee is composed of George M. Gillette, chairman; E. J. Gittins, J. B. Bartholomew, A. H. Gilbert, Grant B. Willis, C. S. Brantingham, Harry H. Bates and W. R. Snively.

## Paige Maps Campaign for Used Car Sales

### "Background" Advertisements Will Create Confidence on Part of Public

DETROIT, Dec. 6—Convinced that one of the principal causes for the failure of used car demand has been lack of confidence in the integrity of the dealer offering the car, the Paige-Detroit Motor Car Co. has mapped out a campaign of "background" advertising designed to build up a greater feeling of reliability. The advertising matter will be prepared at the Detroit offices and will be run in papers in any city in which the Paige dealer will assume 50 per cent of the cost.

This advertising will serve only to create confidence. The dealer must run his own ads describing the particular cars which he has to offer. The feature of the "background" ads is the guarantee that all cars are strictly in the condition represented and that money will be refunded if they fail to perform up to the standard set. It formerly was the custom to run three new car ads to one used car insertion. This practice will be reversed for the time necessary to clear stocks of Paige dealers.

Folders have been prepared at the factory illustrating the best arguments for the purchase of used cars. They will be furnished to dealers at the price of printing.

### NO DUTY ON TRUCKS

LONDON, Nov. 25 (By Mail)—Nyassaland's revised customs tariff puts motor trucks on the free list. It must be proved, however, to the satisfaction of the Collector of Customs that each vehicle has been constructed, adapted and intended to be used solely for the conveyance of goods, while chassis, components and accessories must be so proved to be imported solely for such vehicles.

## Competition Slight In Truck Exports

**Gordon Lee Tells Sales Managers  
Foreign Rivalry Is Not  
Important**

DETROIT, Dec. 5—American motor truck manufacturers will be little affected by foreign competition in the export markets of the world for some time to come, said Gordon Lee, director of the automotive division of the Bureau of Foreign and Domestic Commerce, addressing the annual convention of the National Association of Motor Truck Sales Managers, in session here.

Referring to the truck producing companies of England, France, Germany, Italy and Belgium, he showed that even operating at maximum capacity, they could take care of only half the export business done by American manufacturers in 1920. These countries, he said, had recovered the business done by American manufacturers previously, but in the export markets their competition was not important.

### Confidential Information Sought

Questionnaires will be mailed to all car and truck manufacturers soon after Jan. 1, asking for detailed confidential figures on exports in 1921, so that these may be turned back into percentages showing just how American motor products found export markets in 1921. General co-operation in the preparation of these, he declared, is necessary in getting a good start toward business in 1922.

Questionnaires will be received monthly from the 850 commercial attachés in all foreign countries outlining prevailing conditions and a constant cable service will be maintained, Lee said, in getting immediate information to manufacturers on prospective business.

### To Stimulate Truck Business

Continuance of the movement toward standardization in the automotive field was urged by Lee, the interchangeability of parts being a strong factor in favor of American products. The department is continuing its activity in this respect with the active co-operation of the Society of Automotive Engineers committee, headed by David Beecroft, president of the society.

C. W. Treadwell, manager of sales instruction for the Burroughs Adding Machine Co., demonstrated to the convention the increased success the Burroughs company has found through the sale of its product by sales portfolio rather than demonstration of the machine itself. He said the same method could probably be employed with success in truck sales, the idea being to interest the prospect in the results of transportation rather than the means.

At the executive sessions of the association the business outlook for 1922 was closely studied and plans were considered whereby the association could ren-

der assistance in bringing the truck business to the fore. It was agreed that there would be greater stimulation in the truck business than there has been for a year or more and every effort will be made to further it.

Two directors were re-elected, A. C. Burch of Clydesdale and C. J. Helm of Acme, and one new director, Charles Costello of United States was named. Officers for 1922 will be chosen at a directors' meeting to be held this month.

## Month Makes Record in Shipment of Cars

(Continued from page 1137)

Stabilization of prices, both for the materials which go into motor vehicles and for the finished product, is one of the important problems confronting the industry, and there are increasing indications that costs are adjusting themselves to an era of keen competition. It is the general belief that another month will bring readjustments which will stand for some time.

All eyes are turned toward the New York and Chicago shows which promise the largest number of important announcements made at these expositions in years. An evidence of the public interest in automobiles is found in the large attendance at the New York salon at which only high-priced cars were displayed.

A determined effort will be made at the coming session of Congress to have removed the excise or "stigma" taxes which the new tax bill continued on sales of automotive vehicles and equipment. It is expected also that the Graham joint resolution, which would impose a duty of 90 per cent on American-made surplus war equipment reimported from Europe, will be passed by Congress and cut off this unfair competition.

## Allan A. Ryan Purchases Block of Durant Stock

NEW YORK, Dec. 7—Allan A. Ryan, who previously has played an important part in the development of the automotive industry, has taken over a large block of stock of the Durant Motors Co. of Indiana, a subsidiary of Durant Motors, Inc., and will act in a brokerage capacity in handling its sale. This stock will be listed on the curb market and trading in it is expected to be brisk.

Wall Street has been speculating for some time over the possibility of a financial combination between the Durant and Ryan interests, but it can be stated on authority that Ryan simply is acting as a broker for W. C. Durant and his associates. It also can be stated positively that no negotiations are pending for the amalgamation of the Stutz Motor Car Co., with which Ryan has been closely identified, with Durant Motors.

## Government Will Buy Few Motor Vehicles

**Budget Presented to Congress  
Makes Provision for Ex-  
tensive Research**

WASHINGTON, Dec. 5—Estimates submitted to the Congress to-day by the newly created Budget Bureau show that the Government does not contemplate entering the automotive market as a heavy purchaser of motor vehicles during the fiscal year of 1923.

Because of the large quantities of surplus material on hand sentiment in Congress is opposed to purchases of new automotive equipment until it is evident that the surplus has been completely absorbed. However, there is the sign that the Federal authorities expect to spend several millions in research pertaining directly to the automotive trade. There will be live prospects for aircraft and accessories.

### Air Service Asks \$15,000,000

The estimates of the War Department include \$3,038,037 for motor transportation of the Army to be devoted principally to transportation of troops and supplies.

The Army Air Service submitted estimates for \$15,000,000, of which \$3,000,000 will be devoted to the purchase of new aircraft and equipment. The Army plans to spend \$4,200,000 of the appropriation for experimental research in aircraft matters.

It is proposed to use \$250,000 in experimental research into helium, and \$525,000 for the procurement, installation, improvement of gas plants, hangars, repair shops and ground equipment for the air service.

### Navy Given \$17,000,000

The estimate of appropriations for the Bureau of Aeronautics of the Navy Department gives the total amount as \$17,000,000. It is proposed to use \$6,618,100 of this for the maintenance and operation of air stations, fleet activities, aircraft factories, helium plants, testing laboratories, spares, engines and hulls, flying, overhauling and repairing of aircraft and their engines. For new construction and procurement of aircraft and equipment (power plant and hull), \$6,631,450 is provided, and for continuing experiments and development work for all types of aircraft, \$1,116,950. The sum of \$475,000 is asked for construction incident to flying, stowing, releasing or securing aircraft.

Fifteen thousand dollars is asked by the Bureau of Standards for the standardization and testing of mechanical appliances. The Bureau also requests \$45,000 for the maintenance and equipping of automotive engines.

The Bureau of Public Roads has renewed its request for an appropriation of \$48,000 for investigating engineering problems pertaining to agriculture.

## INDUSTRIAL NOTES

**General Motors Corp.** reports that one out of every four of its stockholders is a woman. In April one out of every five was a woman. There were 17,230 women stockholders of record Oct. 3 as compared with 15,116 on April 15. Women now constitute 21 per cent of all common stockholders and own a total of 6 per cent of the entire issue outstanding. They constitute 45 per cent of the preferred stockholders and own 37 per cent of the outstanding preferred. They represent 41 per cent of the 6 per cent debenture stockholders and own 28 per cent of that stock outstanding. With the 7 per cent debenture, women constitute 21 per cent of the holders of that issue and own 24 per cent of the 7 per cent debenture outstanding.

**The White Co.** reports that its sales for October were the highest for any month since June, 1920, and that its November business was within about 5 per cent of October. The company has been operating a 44½-hour week for more than a month, as compared with a 32-hour week in July and 40 hours in August, September and most of October. The working force now numbers 2000, which is about one-third of the aggregate employed during the peak period. Inventory, which at the end of 1920 stood at \$22,989,000, is now \$16,000,000.

**Hendee Mfg. Co.** is gradually increasing its operations. Manufacturing efficiency is reported to be the highest in the history of the company. In November of this year the company produced 1000 motorcycles and as of Dec. 2, 1921, had orders for 5000 machines. The management is said to be expecting a large business in the spring for both the domestic and foreign account. The company is planning to prosecute vigorously the development of its business in the British Isles.

**Savidge Tractor Co.** has reorganized as the Savidge Tractor Mfg. Co. with the following officers: President, William Savidge; vice-presidents, C. J. Jacoby and W. M. Edinger; secretary, R. H. Dalby; treasurer, Louis Haefner. These officers together with Frank A. Payton, W. F. Korte, Henry Wehde, Jr., A. J. Schuessler, C. F. Stelzel and John Strubel constitute the board of directors. The new capital is \$300,000 preferred and \$200,000 common.

**Victor Kreft Mfg. Co.,** formerly of Two Rivers, Wis., has completed its new factory at Eagle River, Wis., and is again in quantity production on shock absorbers and other metal automotive specialties. The concern has contracts on its books with more than a dozen state distributors calling for 2000 sets of shock absorbers for delivery in the next three to five months, as well as large orders for the other articles of its line.

**International Harvester Co.** Springfield works expects to open this week with nearly a normal force. Production methods are being slightly changed. Production of the light motor truck will soon be brought up to 25 a day, the outlook for business steadily becoming more optimistic. The gray iron foundry has been opened with a force of 75 men.

**A. O. Smith Corp.,** Milwaukee, is engaging in quantity production of a pressed steel running board designed for replacements on cars having the ordinary wooden board, as well as for new designs of cars. The weight of the steel article is no greater than the wooden board.

**General Auto Supply Co.,** Lancaster, Pa., announces the location of its main offices at Harrisburg. The Lancaster and York stores

will be continued, but that at Lebanon will be closed after the first of the year.

**Firestone Tire & Rubber Co.** has purchased the Apsley Rubber Co., manufacturing boots and shoes at Hudson, Mass. Firestone is also considering entrance into other fields of rubber manufacture.

**Loening Aeronautical Engineering Corp.** is erecting a factory at 420-428 East Thirty-first Street, New York City. It is expected that the new building will be ready for occupancy in the spring.

**United States Radiator Corp.** of Detroit, a \$4,000,000 Michigan corporation, has filed articles and been granted a local charter in Wisconsin. Offices will be established in Milwaukee.

**Willys-Overland Co.** has received a Pacific coast order for 400 Willys Knights and Overlands this week. A special train will take them from the factory in about a month.

Cleveland Trade Exceeds  
That of Last November

**CLEVELAND, Dec. 6**—Business in Cleveland improved greatly in November over the previous 30-day period, according to a survey that has been made by the Cleveland Association of Credit Men.

The improvement shown during November is not the stimulation of Christmas buying to trade, for the annual holiday shopping period is just getting under full swing in this city, as it cannot be said to fairly start until the first of December.

The credit men sent a questionnaire to many merchants in the city, and in the list were automobile retail salesmen. They, with few exceptions, reported that there was a healthy increase in November over the previous month. So far as the 1920 November record is concerned, it has been left far behind.

Sixty-four per cent of the merchants questioned about November business reported that it was better than in October; 18 per cent said it was stationary and 18 per cent said their volume of sales was lower in November.

Chicago Truck Makers  
Limit Sales District

**CHICAGO, Dec. 5**—Chicago motor truck manufacturers, with but one or two exceptions, are confining themselves to sales in the local territory. They are not going out of Chicago and immediate territory to keep up their rate of production, and with some this is to be the practice rather than an expediency.

Exceptions are the Available Truck Co., which reports that its sales are greater than for a long time and are scattered over a wider territory through the efforts of its sales force, which has been greatly reduced. Diamond T sales are strong in Chicago, and this company will continue a strong competitor for local business.

**Chicago Motor Truck, Inc.,** is closed down at the present time taking inventory, but will open after the first of the year on scheduled production of one truck a day.

## FINANCIAL NOTES

**Moline Plow Co.** reorganization committee has addressed a circular letter to the holders of the 7 per cent notes extending the time of the deposit to and including Dec. 12. Total claims of all creditors and noteholders, the letter states, computed without interest, approximate \$19,500,000, of which \$13,650,000 represents claims of bank creditors, \$1,840,000 merchandise creditors and \$4,000,000 serial noteholders. More than 80 per cent of the serial noteholders have deposited and bank creditors, constituting 70 per cent of the total claims, have accepted the reorganization plan.

**Fisher Body Co.** for the three months ended Oct. 31 reports a surplus after charges and Federal taxes of \$1,939,541, which after allowing for preferred dividends was equal to \$3.75 a share on the 500,000 shares of common stock of no par value outstanding. In the previous quarter earnings were equal to \$2.30 a share and in the same quarter last year \$5.05 a share. The surplus for the six months was equal to \$6.06 a share after preferred dividends, as compared with \$9.34 a share in the same period last year.

**Yellow Cab Mfg. Co.,** subject to approval of the stockholders, declared a stock dividend of 100 per cent on Class B stock, increasing total outstanding to 100,000 shares, and has increased the cash dividend rate from \$7 to \$7.20, payable in monthly installments of 60c. each. Stockholders will hold a special meeting this month.

**Sharon Pressed Steel Co.** final plans for refinancing and taking care of the creditors of the organization have been completed. The statement of the present financial condition of the company shows current assets, \$437,452.63; property, plant and equipment, \$1,805,786.76; current liabilities, \$207,429.11.

**Commonwealth Finance Corp.** has declared the regular quarterly dividend of \$1 a share and an extra dividend of 75c. a share on its common stock and the regular semi-annual dividend of 3½ per cent on its preferred stock, payable to holders of record Dec. 31.

**Autosales Corp.** declared a dividend of 4 per cent on the preferred stock, payable in preferred stock Dec. 31 to stock of record Dec. 16. In December last year the company declared a dividend in preferred stock amounting to 4½ per cent.

**Jordan Motor Car Co.** directors, at a meeting this week, declared a quarterly dividend of 1½ per cent on the preferred stock, payable Dec. 31, to stockholders of record Dec. 10.

**American Metal Parts Co.,** Milwaukee, specializing in automotive parts and equipment, has recently increased its capitalization from \$100,000 to \$200,000 to accommodate the growth of the business.

**Hendee Mfg. Co.** has declared quarterly dividends of 1½ per cent on preferred stock, thus maintaining the rate of previous years.

**Torbenson Axle Co.** has paid a quarterly dividend of 1½ per cent on preferred stock.

## JENNINGS SPEAKS AT SYRACUSE.

**SYRACUSE, N. Y., Dec. 5**—Clyde Jennings, managing editor of *Motor Age*, appeared before the students of transportation in the College of Business Administration at Syracuse University in the first of a series of lectures to be delivered by various speakers on the subject of transportation. He surveyed the history of transportation.

## MEN OF THE INDUSTRY

C. E. Wilson, chief engineer of the Remy Electric Co., has been appointed factory manager as successor to I. J. Reuter. Reuter has been named general manager of the company to succeed J. D. Mooney, who has become operating vice-president of the General Motors Export Co. F. C. Kroeger, Remy sales engineer in charge of the Detroit territory, succeeds Wilson as chief engineer.

J. H. De Jong, for the past three years associated with the Cole Motor Car Co., has joined the selling division of the Haynes Automobile Co. as Canadian district sales manager, with headquarters in Toronto. Prior to his association with the Cole company, De Jong was a distributor at Omaha for twelve years.

O. Q. Hinds, who has sold his interest in the former Anderson Electric & Equipment Co. of Chicago, has associated himself with B. J. Grigsby, O. E. Grigsby and W. C. Grunow in the Grigsby-Grunow-Hinds Co., a company formed to manufacture automobile accessories.

M. Lincoln Shuster, assistant general manager of the Motor and Accessory Manufacturers' Association, is in Washington this week to take up with the Bureau of Foreign and Domestic Commerce the question of establishing an export department of the M.A.M.A.

Wilson Bailey, who has been acting as eastern district manager for the Trackless Transportation Corp., has been appointed to the position of general sales manager in charge of all sales, both domestic and foreign, for the corporation.

W. C. (Fuzzy) Anderson, former foreign sales executive for the Ford Motor Co., has organized the Anderson Sales Co. of St. Louis to market the new Brevard farm lighting system. Thomas G. May will be secretary of the company.

Federal Corp. Trustee Loring G. Lane has been authorized by the referee in bankruptcy to dispose of the company's property at Westfield, Mass., at public or private sale. The company manufactured spark plugs.

Harry L. Cunningham, Detroit, secretary-treasurer of the Rickenbacker Motor Co. and former Michigan distributor for Maxwell and Studebaker, has been appointed to handle the new Rickenbacker for Michigan.

J. E. Simonds has resigned as export manager of the U. S. Tractor & Machinery Co. He was formerly Chicago manager of the Duplex Engine Governor Co. His future plans are not announced.

John G. Painter, for a number of years sales manager of the Continental Motors Co., has joined the Detroit Pressed Steel Co. as special representative in the Disteel wheel factory sales division.

T. N. Hart, who has been active in the tractor and implement business for several years, has been appointed block manager of the Lima, Ohio, district for the Bates Steel Mule Co. of Ohio.

Alemite Products Co., Ltd., subsidiary of the Bassick Mfg. Co., will begin the manufacture of its products at Belleville, Ont., this month. W. E. Rowsome is general manager.

Gordon Cameron has been appointed director of service for the Republic Truck Sales Corp., in complete charge of the servicing of Republic trucks from the factory.

Edgar Updyke, automobile dealer in Indianapolis, has been named distributor for the Stutz Motor Car Co., covering the Indiana territory.

Jules Berthier has been elected president of the Bergougnan Rubber Corp. to succeed H. H. Coleman, resigned.

E. T. Fuller has taken over the Franklin franchise for the State of Michigan formerly held by W. J. Dougherty.

Walker Evans has been appointed Cleveland representative of MacManus, Inc., advertising agency, Detroit.

## BANK CREDITS

*Written exclusively for AUTOMOTIVE INDUSTRIES by the Guaranty Trust Co., second largest bank in America.*

Call money remained unchanged at  $4\frac{1}{2}$  to  $5\frac{1}{2}$ , with a firmer undertone noted, which possibly may have been accounted for by Government withdrawals from local banks and preparations for the interest and dividend disbursements of Dec. 1. There was a slightly easier undertone in time money as evidenced by the 5 per cent rate for all fixed-date maturities from 60 days to 6 months as compared with 5 per cent to  $5\frac{1}{4}$  per cent during the previous week. Prime commercial paper remained unchanged at 5 per cent to  $5\frac{1}{4}$  per cent.

The Federal Reserve statement as of Nov. 30, 1921, showed the total amount of notes in circulation as \$2,366,006,000, a decline of \$23,910,000 from the previous week, representing the lowest total reported since Sept. 27, 1918.

The total reserves of the New York institution increased \$18,302,000, the factors in this being an increase of \$21,599,000 in gold reserves and a decrease of \$3,297,000 in other cash reserves.

## Sterling Rises

The number of commercial failures reported for the month of November was 1988 with total liabilities of \$53,469,839. The number of November failures is the largest for any month this year and is 938 more than in the month of November, 1920, when 1050 failures were reported with total liabilities of \$30,758,130. The amounts involved in the failures for November, 1921, however, were exceeded in February, March and May of this year.

The average of operations for all steel plants for the month of November was estimated at 40 per cent to 45 per cent against 30 per cent or less at one time last summer. Lake Superior iron ore shipments in 1921 amounted to 22,300,726 gross tons, the smallest amount moved since 1904. Much interest attended the announcement on last Friday that negotiations were under way for the ultimate consolidation of several of the independent steel companies.

## Moratorium a Factor

During the past week demand sterling rose to  $\$4.07\frac{1}{2}$ , a new high record for the year and the highest level since the week ended Nov. 22, 1919, when the rate touched  $\$4.08\frac{1}{2}$ . The discussion of the proposed two-year moratorium for Germany on its reparation payments was perhaps a factor, not only in this rise in sterling, but in the sharp recovery in German marks.

## METAL MARKETS

**M**ANY are the hopeful signs that are visible in the present twilight period of the steel market. Of course, what actual buying by automotive consumers is in evidence is strictly of a routine, filling-in character, but the preliminaries to negotiations for 1922 contracts are decidedly encouraging to the steel industry, portending a healthy automotive demand during the first half of the coming year.

Alloy steel specialists report keener interest in automotive steels, although the tonnages involved in inquiries are by no means impressive individually. Much resale alloy steel has, however, been gotten out of the way and the market faces a much improved outlook. About the frailest item in the list of automotive steels is that of cold-finished steel bars. Although the market for this commodity is fairly steady, this is solely due to the incisive retrenchment which has been made in production. The latter continues, even at this advanced date of readjustment in other branches of the steel industry, at not more than one-fifth of the finishing capacity.

Although the sheet market is now heralded to be on the uniform basis of 2.25c. for blue annealed, 3c. for black, and 4c. for galvanized sheets, the price levels recently announced by the Corporation's sheet subsidiary, there continues considerable irregularity. Some of the mills have essayed a dual price for blue annealed, one applying to the heavy gages and another to the lighter gages, from 13 gage and up. Plate mills continue to share the 2.25c. base price freely when inviting tonnages of heavier gages are offered.

**Pig Iron.**—Automotive foundries are not figuring very prominently in the market just now. At best, the pig iron market is marking time.

**Steel.**—Bessemer screw stock is being quoted at 1.60c., Pittsburgh, on hot-rolled bars, demand being of a routine character. Cleveland alloy steel interests quote automotive steels as follows: Bars, S.A.E. \$100, \$4 per 100 lb., base; S.A.E. 2300, \$5; S.A.E. 6100, \$5; S.A.E. 3200, \$5.50; S.A.E. 3300, \$7.50; S.A.E. 3400, \$6.50; silico-manganese, \$3.90; S.A.E. 52100, \$9; and chrome-molybdenum steel, \$4.75.

**Aluminum.**—Odd lots of imported aluminum continue to be offered at prices lower than those named as official quotations by the domestic producer. As previously stated, the trade's interpretation of the official prices of the domestic consumer is, however, that they are not necessarily rigid and that on worth while business of the desirable kind foreign competition is being met most energetically.

**Copper.**—As the result of the recent advances in the copper market the principal makers of copper and brass products issued new price lists on Dec. 1, showing advances ranging from  $\frac{1}{4}$ c. to  $\frac{3}{4}$ c. per lb. on the different articles they produce. A period of quiet in the copper market is now generally looked for.

## EQUIPMENT COMPANY BANKRUPT

**KANSAS CITY, Dec. 5.**—The Zahner-Fowler Equipment Co., with factory and distributing house in this city, has filed a petition in bankruptcy in the Federal Court. Unsecured obligations for machinery, steel and materials, are about \$15,000 and notes to banks and creditors a like amount. Assets aggregate \$25,000.

# Calendar

## SHOWS

- Jan. 7-13—New York, National Automobile Show, Grand Central Palace. Auspices of N.A.C.C.
- Jan. 9-14—New York, Motor Car Body Exposition, Automobile Body Builders Association, Twelfth Regiment Armory.
- Jan. 28-Feb. 4—Chicago, Automobile Salon, Hotel Drake.
- Jan. 28-Feb. 4—Chicago, National Automobile Show, Coliseum, Auspices of N.A.C.C.
- Feb. 6 to 11—Seventh National Tractor Show and Educational Exposition, Minnesota State Fair Grounds, Minneapolis.

Feb. 6 to 11—Winnipeg, Can., Automotive Equipment Show, Western Canadian Automotive Association.

## FOREIGN SHOWS

- Dec. 3-14—Brussels, Belgian International Automobile Show.
- March, 1922—Santiago, Chili, Annual Automobile Show.
- May, 1922—Quito, Ecuador, Agricultural Exposition, celebrating Centenary of Ecuador. Automotive Section.
- Sept. 1922—Rio de Janeiro, Brazil, Automobile exhibits in connection with the Brazilian Centenary Association Automobilista Brasileira.

## CONVENTIONS

- Dec. 10—New York, American Institute of Mining and Metallurgical Engineers.
- Dec. 20—Philadelphia, American Society of Mechanical Engineers.
- Dec. 27-29—Chicago, American Society of Agricultural Engineers, Auditorium Hotel.
- Jan. 17-20, 1922—Chicago, American Road Builders Association.
- Jan. 30-31—Chicago, Fifth Annual Convention, N. A. D. A., La Salle Hotel.
- Jan. 30-Feb. 2—Boston, Sixth Annual Conference of the International Delivery

Association, Copley Plaza Hotel.

June 11-15—Milwaukee, Annual International Convention of the Associated Advertising Clubs of the World.

Sept. 13-23, 1922—Rome, Italy, Second Annual Meeting of the International Chamber of Commerce.

## S. A. E. MEETINGS

Detroit, Dec. 23, Feb. 24, Mar. 24, April 28, May 26.

New York, Jan. 10-13, 1922—Annual Meeting.

Chicago, Feb. 1

Minneapolis, Feb. 8-9—Annual Tractor Meeting.

## Reeves Discusses Taxes with Mellon

### Also Confers With Government Officials on Credits and Standardization

WASHINGTON, Dec. 5—The outstanding developments of conferences between Alfred Reeves, general manager of the National Automobile Chamber of Commerce and Government officials here last week, was the statement that credit prospects for the automobile industry were distinctly favorable and that standardization activities were progressing without detracting from the individuality of distinctive automobile types.

### Credit Situation Encouraging

Reeves discussed the tax situation as it affects the automobile industry in detail with Secretary of Treasury Mellon. It is expected that this conference will have much to do with the recommendations of this cabinet officer in the future, possibly at the next session of Congress, when an effort will be made to amend the latest tax bill and remove burdensome excise taxes from the automotive industry.

Governor Harding of the Federal Reserve Board gave Reeves an encouraging view of the general credit situation as it affected the industry. It is expected that money will be available at lower rates during the winter.

### Working on Standardization

At the Department of Commerce, the automobile representative discussed standardization activities of the Bureau of Standards. He was told that the principal effort was directed toward the elimination of waste, and as a consequence brought about lower production cost. For instance, he was told of efforts to reduce the 10 or 12 sizes of steering wheels to four, which could be accepted as standard for the automotive industry. So far as Reeves could ascertain, there is nothing in the plan of the Department of Commerce to take individuality from

car designs, but instead they are conducting a great work to save money for manufacturers and incidentally increase sales through lower prices.

Conferences also were held with officials in the automotive division, Bureau of Foreign and Domestic Commerce, and plans were discussed for co-operation of the Government with the industry in the promotion of domestic trade as well as foreign business.

Reeves talked with Senate and House leaders regarding the tax situation and other important problems of the trade.

## Lower Distribution Costs Sought by Tire Industry

AKRON, Dec. 6—The tire industry has turned to selling costs as the next problem to be solved in bringing the industry to rock-bottom basis. Much has already been done in the way of closing expensive branches in the high-rent districts in large cities, but the cost of distributing the products remains as high as 30 per cent in some instances.

Sales departments were the first to feel the new policies brought about by the depression, but changes in policies consisted mainly in weeding out all salesmen except those who were actually producing profits.

This, however, has been found to be insufficient and further plans are being considered to curtail sales costs. The methods to be used are purely a matter of speculation. The factories are on the most efficient basis of their history. Every semblance of extravagance has been eradicated.

## MANY OLD TIMERS ACCEPT

NEW YORK, Dec. 5—The first annual New York dinner of the Old Timers' Club, already announced for Monday evening, Jan. 9, at the "S. S. Flotilla," will be one of the most largely patronized events of automobile show week, according to the committee in charge, which reports heavy early reservations from all parts of the country. The attendance will be automatically limited to 400, the maximum capacity of the "S. S. Flotilla."

## Japan Not Seeking Texas Helium Fields

### United States Navy Department Denies That Negotiations Have Been Opened

WASHINGTON, Dec. 5—Recommendations have been made by Dr. Joseph S. Ames, chairman of the National Advisory Committee for Aeronautics, for the acquisition by the Government of the best helium producing fields and for the promotion of research into the uses of helium. There has been a rumor current that emissaries of the Japanese Government had made overtures to the Navy Department for the purchase of helium properties in Texas but the Navy officially denies such negotiations.

The helium fields in Texas are under the joint control of the Army and Navy. According to Dr. Ames, it is necessary for national defense to acquire and seal these properties for future use and prevent their exploitation by commercial interests.

Helium, a non-inflammable gas, is expected to revolutionize aircraft product especially as it relates to dirigibles. A demonstration before scientists here today showed that helium is superior to hydrogen with the exception that the lifting power is eight per cent below that of hydrogen.

## Export Managers to Meet During New York Show

NEW YORK, Dec. 7—Export managers of the National Automobile Chamber of Commerce will meet here in their annual convention on Jan. 10, during the annual show. Decision to hold this meeting was made to-day by the N. A. C. C. directors.

The proposed program will take up the subject of distribution in foreign countries, road building, financial credits for the automotive industry from the War Finance Corporation, and the possibilities of combination of American firms for developing export trade.

Body Hardware

Many motor car manufacturers and body builders have a decidedly mistaken conception of the correct way to purchase automobile body hardware.

Because so little of it is visible in the finished body, they believe it economy to purchase cheaper equipment.

In order to get a "price" they scatter their purchases in a dozen different places—among hardware manufacturers whose policy is quantity instead of quality.

Concentrating in a line of hardware with an established reputation is the logical way to buy. For a uniform standard of quality must be maintained throughout the building of any motor car, if the car is to be successfully sold and stay sold.

The worth of Ternstedt Hardware is firmly established. Each and every appliance is built to a set standard of quality. Each is designed to exactly fill a certain purpose. There is equipment for every requirement.

That Ternstedt does play an important part in maintaining a uniform standard of quality is best evidenced by the large group of motor car manufacturers and body builders who have concentrated in Ternstedt Equipment *exclusively*.

## Sound Tariff Principles Warrant Support of Industry

Tariff Principles Committee of U. S. Chamber of Commerce has made seven recommendations which are of vital importance to automotive industry. Adoption would aid the industry directly in foreign trade and indirectly in domestic sales.

By Norman G. Shidle

**T**HE automotive industry is dependent upon general industrial conditions. And general industrial conditions are closely related to tariff problems. Thus the automotive manufacturer is vitally concerned with the application of sound principles to tariff adjustment, even though the direct effect of tariff is less on his industry than on many others.

As the second largest industry in the country, the automotive industry is vitally concerned with any question which affects the economic development and progress of the nation and of the individual manufacturing organizations which comprise American industry. As an unsettling factor in the business world, the tariff is probably without serious rival for premier honors. It has been said that back in the '80s and '90s business was almost forced to take a vacation two years out of every four: one year preceding every election to wonder what was going to happen to the tariff and one year following every election to wait for it to happen.

The political character of our tariff causes similar unsettled business conditions even at the present time,

and automobile manufacturers are definitely concerned in any constructive effort to alleviate this situation. If tariff questions were out of politics, general business conditions would fluctuate less violently and would not be unsettled with every presidential election. The prosperity of the country would be enhanced, through more constant production and industrial effort, and the market for automotive products would be easier to predict and less difficult to sell.

The importance of foreign trade to the automotive industry adds greater weight to the tariff problem, viewed from the automotive standpoint. Feeling the necessity for foreign trade opportunities to be more important than the exclusion of foreign competition in this country, the N. A. C. C. recommended lower duties on automobiles than were contained in the previous tariff law, and as a result succeeded in getting the former schedule of 40 per cent reduced to 25 per cent in the bill that has been under consideration in Washington for the last eight months. The tariff bears more directly upon the automotive industry in its effect upon foreign markets than in any other way, but the extreme importance of the indirect in-

fluences pointed out, renders the question one of immediate concern to every manufacturer.

Consequently, the recent report of the Tariff Principles Committee to the Board of Directors of the Chamber of Commerce of the United States should be carefully examined by executives throughout the industry. Its acceptance by the Chamber and subsequent adoption by the government would effect a stabilization in business and an ultimate economy in the carrying on of industry that would almost equal in scope the results of the disarmament conference, should that conference fulfill the best hopes of the nation.

The Tariff Principles Committee was concerned, not with attempting to write a new tariff bill, but with outlining the fundamentals upon which sound tariff legislation should rest and the principles which should be applied in "taking the tariff out of politics" and making it function for the best interests of American business and industry. The committee made seven recommendations.

The first recommendation is "that tariff legislation should be so framed by Congress as to permit subsequent adjustment of individual rates or particular schedules of rates within prescribed limitations, and authorize changes therein from time to time without general revision of the tariff; that reasonable latitude in the application of tariff rates to any commodity, or group of commodities, be provided for, in order that there may be flexibility in the adjustment of said rates to the varying fluctuations of industrial and trade conditions."

The second recommendation is closely allied with the first, so that the two may be discussed simultaneously. It is as follows:

"That tariff legislation should provide for and create a Tariff Adjustment Board, appointed by the President and confirmed by the Senate, with such emolument and tenure of office as will remove the members from political influence and personal interests; that this Board shall be separate and distinct from the United States Tariff Commission, the duties of which should be modified to require report of its investigations to the Tariff Adjustment Board in addition to the reports it now makes."

The adoption of these two recommendations would mean that the setting of tariff rates would be in the hands of a board of impartial experts. The responsibility for the actions of the board could be definitely fixed in a way that is utterly impossible as regards Congress. The responsibility for the appointment of men to the board would reflect credit or discredit very readily upon the President and this in itself would go far toward assuring the appointment of a capable and impartial board. The Interstate Commerce Commission furnishes an example of the possibilities of a non-political body of this kind and indicates the practicability of the recommendation.

The idea is that Congress would simply indicate in the tariff bill certain wide limits within which the board would have power to adjust duties. It would be necessary to make these limits wide enough that the board would have a considerable degree of power; otherwise the plan would be rendered ineffective. It would be necessary, of course, to guarantee the country against

continual change of tariff rates at unreasonable short intervals. The committee has recognized this fact by recommending that Congress specify that any rate established is not subject to change within a fixed period from the date when it becomes applicable.

President Harding endorsed the principle of a flexible tariff in his recent address to Congress when he said: "Doubtless we are justified in seeking a more flexible policy than we have provided heretofore. I hope a way will be found to make for flexibility and elasticity, so that rates may be adjusted to meet unusual and changing conditions which cannot be anticipated."

His method of providing this flexibility, however, is somewhat different than that recommended by the committee of the Chamber of Commerce. The Smoot amendment, introduced immediately after the President's address, embodies the latter's ideas along this line:

This board, proposed by the committee, operating as outlined, would eliminate the necessity of constantly writing new tariff bills, would take away the uncertainty concerning tariff now prevalent at every election, and would allow American business to continue its normal course unaffected by political considerations of tariff legislation.

Even more important, however, it would make possible the ready adjustment of tariff schedules to current conditions. Under present methods a tariff measure is very likely to be entirely out of date, so far as its usefulness is concerned, by the time it has made its way through the toils of political debate into the final form of a law. The recent emergency tariff measure furnishes an excellent ex-

ample of such a measure. As President Harding said in his message, "A rate may be just to-day and entirely out of proportion six months from to-day." The method recommended would enable us to have a tariff constantly fitted to current conditions, regardless of the degree of fluctuation in economic and business movements.

Further analysis shows such a board to have other important potential functions. It might save manufacturers a great deal of money very directly by eliminating the usefulness of or the necessity for expensive lobbies. Where there are two conflicting industrial interests, the board might call them together in conference and get something like the real facts of the case upon which to base an intelligent decision; it might even get the opposing interests to render a joint compromise proposal. In other words, the board might function to some extent as an arbitration body on tariff matters. This phase is not suggested in the report of the committee but would seem to be a perfectly possible and logical development were the recommendations of the committee carried out.

In its third recommendation, the committee advocates reasonable protection of American industries that are subject to destructive competition from abroad and states that "there must be protection against emergency prices and emergency conditions that may prove destructive." It further states that "there is no thought of urging a Chinese wall type of protection nor a policy of attempting to foster any and every industry that may be started on American soil."

A fourth section recommends the maintaining of anti-dumping legislation now on the statute books. This

---

**A**UTOMOBILE and truck sales depend primarily upon the normal and continuous functioning of business. The application of sound economic principles to tariff would go far toward reducing industrial fluctuations. Every executive should examine carefully the proposals of the Tariff Principles Committee of the U. S. Chamber of Commerce. This committee has not been concerned with writing a new tariff law, but only with the principles upon which sound tariff action should be based. The recommendations have been put to a referendum of the members of the national body.

---

should meet with the entire approval of the automotive industry, especially as regards reimportation of goods originally manufactured in the United States. The Graham resolution, which according to latest reports will place a duty of 90 per cent on such goods, will take care of the immediate needs of the automotive industry in this respect—provided it is passed, as now seems likely. The general principle enunciated by the committee, however, should be supported by the industry for more permanent protection.

The fifth recommendation of the committee deals with the framing of tariff legislation with a view to encouraging our foreign trade. In addition to recommending this practice, the committee practically indorses the provision in the tariff bill at present under discussion which gives to the President bargaining powers as regards tariff treaties with various countries. This would enable the President, for example, to force Canada to give us cheap wood for wood pulp if we are to give Canada cheap coal.

The automotive industry has been among the first to recognize the direct relation between domestic tariff and foreign trade and to attempt to have the two correlated in practice. It has recognized the necessity of having a domestic tariff calculated to promote the good-will rather than the enmity of foreign countries if Ameri-

can products are to be successfully sold abroad.

The committee recommends that the "American valuation plan" not be adopted. Space is lacking for a full discussion of the pros and cons of this particular question, but a close analysis of the problems indicates that there is little question but that the "American valuation plan" would fail to work for the best interests of American industry.

The final recommendation favors "the postponement of a general revision of the United States Tariff until conditions in international trade and finance are sufficiently stabilized to form a basis for legislation possessing permanent value."

The recommendations of this committee are the result of a study which has been carried on for over a year by a group of the most able business men in the country. A thorough analysis of the proposals, together with an examination of their importance to the automotive industry, brings out forcibly the benefits which would accrue to manufacturers through their adoption. This result cannot be obtained without considerable pressure from business. By putting its whole weight behind these recommendations, the automotive industry can perform a very real and practical service for itself, for the industries which contribute to it, and for American industry as a whole.

## Motor Vehicles in the Postal Service

**A** GENERAL survey of motor transportation in the Post Office Department has shown the desirability of reducing the number of trucks to eight standard types, which are economical and especially suitable for the service. In his annual report to the President, Will H. Hays, Postmaster General, declared that standardization of equipment will contribute to better service at a substantial reduction in cost.

A statistical study of the Government-owned motor-vehicle service to determine the cost of operation per mile and per hour and miles per gallon of gasoline for the fiscal year of 1921 shows how various trucks and cars perform in the strenuous work of the postal service. A well-known model with  $\frac{3}{8}$ -ton capacity costs 17 cents per mile without driver; 31 cents with driver; 71 cents per hour without driver; \$1.32 per hour with driver, and travels 8.1 miles per gallon of gasoline. Three standard makes of trucks of  $\frac{1}{2}$ -ton capacity showed varying costs. One cost 20 cents per mile without driver; 91 cents per hour without driver, and traveled 8.5 miles per gallon of gasoline. Another of the same capacity cost 34 cents per mile without driver; \$1.11 per hour without driver, and traveled 4.7 miles per gallon of gasoline. Another truck with the same carrying capacity cost 31 cents per mile; \$1.18 per hour without driver, and made 4 miles per gallon. One model truck with a capacity of 1 ton cost 18 cents per mile without driver and another of the same carrying weight cost 31 cents. The former got 7 miles per gallon and the latter 3.9 miles.

A similar study of Government-owned motor trucks operated 16 hours a day for 365 days a year showed the rate of depreciation for a year. The smaller type, with a capacity of 750 lb., depreciated 25 per cent, while three trucks of popular make, having a carrying capacity of 1000 lb., showed a depreciation of 33  $\frac{1}{3}$  per cent for two models and 25 per cent for another model.

The depreciation for the trucks having a carrying capacity of 3000 lb. or more averaged 20 per cent.

During the fiscal year 1921 Government-owned motor-vehicle service was extended to 42 additional cities in

lieu of contract service, making a total of 262 cities where Government-owned motor-vehicle service was in operation wholly or in part. This service involved the use of motor trucks of from  $\frac{3}{8}$ - to 5-ton capacities.

The expenditure for this class of service during the fiscal year was \$11,777,842, being an increase of \$2,974,688 over that for the preceding year.

Collection and delivery of department store parcels was inaugurated during the year in one city and the success attending the initial effort in this direction resulted in a demand for similar facilities in many large cities. It was found impracticable to make collection of such parcels except from classified stations, but the delivery feature was rapidly extended, and has resulted in a saving to the merchants, as well as considerable revenue to the department.

The use of motorcycles in the delivery and collection of mails, where feasible, is being continued.

## S. A. E. Tachometer Standard Revised

**R**EVISIONS in the present S. A. E. Standard for Tachometer Drive has been recommended by the Aeronautic Division of the society. An increase in the diameter of the driving shaft from 0.152 to 0.187 in. is recommended, as is an increase in the diameter of the hole for the driving shaft. This would be increased from 0.161 to 0.191 in.

These revisions are recommended because experience has indicated that the present standard dimensions for the shaft connection on the engine end are not of suitable proportions to insure freedom from trouble. This is especially true in the operation of the centrifugal type of tachometer, which turns faster than indicated speed. Breakage has been known to result through use of the present dimensions, even though special alloy steels have been used for the shaft.

The recommendations will be acted upon at the next meeting of the Standards Committee on January 10.

# Need for Fuel Research Shown at Petroleum Meeting

Understanding of difficulties faced by both the automotive and petroleum industries is leading to a praiseworthy disposition to co-operate. More research and education are needed and a demand for more economical engines becomes increasingly apparent. Must face higher fuel prices.

By Herbert Chase

**I**T is almost past understanding how two of the country's greatest industries, each very largely dependent upon the other for prosperity, if not for very life, could have grown up in this country with but slight recognition of their mutual dependence or need for co-operation. Such, however, is the case. A condition of this kind could not continue indefinitely. The war taught the need for industrial co-operation, and the beginning of such co-operation between the automotive and the petroleum industries occurred in a small way shortly after the war. The seed planted at that time is now starting to germinate, but it has not yet borne fruit.

The annual meeting of the American Petroleum Institute, which took place in Chicago last week set a promising and commendable precedent by arranging for joint sessions in which the technologists of the petroleum industry met members of the Society of Automotive Engineers. It was the first general gathering of men from the two industries and afforded a splendid opportunity for discussion of their mutual problems.

It should be said to the credit of the Society of Automotive Engineers that the meeting was brought about through its efforts and an appreciation of its members of the need for better mutual understanding between those who produce the fuel, on the one hand, and those who build equipment which uses the fuel, on the other.

Apparently few of the petroleum representatives realized why it is becoming increasingly difficult to use present-day motor fuels. For the first time the petroleum industry as a whole established close relations with those who represent their greatest customers and got from them an expression of what the customers' real needs are.

There was general agreement that the user of automotive equipment should be given the most possible for his money in service from the fuel. The automotive men expressed their views as to how this can be done and a willingness to adapt the engine to the fuel as well as possible, but also suggested the desirability of better fuel. Petroleum men, in general, had little to say about the possibility of providing better fuel. Few, in fact, appeared to realize the need or the possible advantage, either to themselves or to the public, of better fuel.

So it appears there is great need for co-operative education regarding the true fuel situation.

When the steel producers found, years ago, that ordinary steels were not satisfactory for most automotive purposes they set about the development of better ones, and have increased their output enormously thereby. Not so the producer of motor fuels. The demand has

increased, in spite of poorer quality, and the onus has been placed upon the automotive manufacturer to adapt his product to the use of the fuel made available. There are many reasons for this, some of them apparently beyond the control of the fuel producer, but it does not follow that conditions could not have been changed had the oil producer sought with energy to improve fuels by employing better refining methods. There are still, in fact, great possibilities in that direction which should be sought through thorough and extensive research. Such research must be vigorously carried on.

To date the fuel producer and refiner have sought to increase motor fuel output chiefly by seeking new oil resources, but for many years the supply has failed to increase as rapidly as the demand, so there is evident need for improved yield of gasoline from the crude. Unless the automotive industry asserts itself forcibly the increased supply will be secured simply by cutting deeper into the crude; that is, by furnishing less and less volatile fuel, and thus placing greater burdens upon the vehicle user and manufacturer.

The situation is, in fact, none too encouraging from the automotive viewpoint. For many reasons the oil man hesitates to admit a future shortage of petroleum even in this country. He has always got more oil by more drilling and wildcatting, but has for several years steadily lost ground in reference to the demand, domestic fields alone considered—a fact which he is prone to forget. Mexico has been making up the deficiency.

The recent American Petroleum Institute meeting heard again the same old story that there will always be an adequate petroleum supply, but it is more frequently qualified by saying, "If America is willing to pay the price she will get her share." "Mexico will continue to supply oil." "Other South and Central American countries have great reserves," and other like statements which are more or less true, but fail to make it clear that motor fuel is going to cost far more in the future than in the past.

There was but little inclination at the meeting to discuss the Mexican oil situation, but, as we reported last week, Sinclair admitted that it is serious, that we cannot afford to neglect consideration of what will occur if 20 per cent or more of our supply of crude is cut off by failure of present Mexican fields.

Two things become increasingly evident. The first, that the automotive industry must expect to face considerably higher prices for fuels, and, second, that every effort must be put forward at once to develop engines which will be more efficient and at the same time use less volatile fuels.

# A Semi-Racing Roadster Body of New Design

It is provided with a permanent top with a rear window which can be easily lowered. A large luggage space with openings at each side is located within the body just aft of the seat. No entrance door necessary.

By George J. Mercer

**N**EW roadster body models are sharing with touring bodies in the tendency toward more comfortable seating arrangements, including higher sides and seat backs. There is also a continued change toward cycle-type mudguards and side steps without running-boards, and larger windshields with wing attachments.

The design shown in the accompanying cut is of the semi-racing type—a model intended for those who enjoy driving at high speed. Bodies of this type are seldom equipped with a top on account of the wind resistance it offers and the unpleasant eddies which it creates.

To minimize these objections the top in the design here shown is made permanent and is carried further back beyond the seat than usual, thus allowing space at the rear of the passengers. A large window which can be let all the way down allows for the escape of the air which otherwise creates pressure under the top. This window is made to operate in a runway in the same manner as closed body windows, but it is smaller than most such windows. It is operated with a lift strap and rests on the fence when up.

The windshield is wide, having a 42-in. glass, which comes well down on the sides of the shroud to afford better protection. The upper part is movable, but the lower is stationary. The lower glass is split in the center to avoid likelihood of breakage. A ventilator is used on top of shroud, and the front end of the top which extends forward of the shield is tapered from the underside up, the reverse of ordinary practice. This makes the top end look thin and also gives a wide angle of vision.

Ordinarily the type of body here shown is made with bucket seats set on the frame, the tanks and tires filling the remainder of the space at the rear. One reason for presenting the cut here shown is to illustrate another and more finished design. The body includes luggage space, but is short to allow space for the tanks at the rear. Nevertheless the locker space provided back of the seat

is commodious and readily accessible from each side.

The shape of the top also differs from common practice, but since it is a permanent structure, greater latitude is permitted than with the folding type. When we do not have to fold the top down, there is no logical reason why it should be made with the restrictions that the folding type entails. A car of any description needs a top. In the summer it often happens that the seat cushions will be uncomfortably hot after the car stands in the sun for even a short time, while the entire interior as well as the

passengers require protection in case of a storm. Since the top is seldom folded, it seems logical to make it stationary, and provide a ventilating window at the rear if the seat is far enough forward to escape the tail dust.

The body shown is made without doors. The height of the body side above the step is 16 in. To make it a ladies car, one door can readily be placed on the right side.

While the use of the roadster is not

as great as it was when the automobile was looked upon merely for pleasure purposes, there will always be the class of buyers who want this type of body. This is especially true among young men who have opportunities to become car owners, and in many cases roadster bodies are being fitted to used chassis for this type of purchaser. The design presented herewith is one that is believed to be suited for this use. It offers a chance for the amateur to build his own body for a second hand car, and while the individual may have tastes somewhat different from the design submitted, it is believed that from the diagrams he could work out his ideas along the lines suggested.

The car manufacturer can also gain from a study of this design some of the principal features which are believed would be desirable to include on a roadster body. Many improvements would probably be made by different manufacturers, but the basic idea is one that includes most of the features that are especially desired by the purchaser of this type of car.

Four views of a new design for a semi-racing roadster body

# The Paris Aeronautical Exhibition

Seventh annual show is made up almost entirely of planes manufactured in France. One Dutch and two Italian makers enter field, however. Chief interest was in the several commercial planes exhibited.

**F**RANCE is holding its seventh annual aeronautical exhibition in the Grand Palais, at Paris, the scene of the recent automobile show. Theoretically international, the exhibition is practically all French, for of the 20 makers showing 35 types of airplanes (Government-owned military machines excluded) there are two Italians (Ansaldo and Ricci), and one Dutch, the rest being purely French firms. England is indirectly represented by a Vickers-Vimy plane built in France under license.

The presence in the show of the Dutch firm, N. V. Nederlandsche Vliegtuigfabrik, and of its chief engineer Herr Fokker, has given rise to a vigorous protest on the part of French manufacturers and aviators.

## French Makes Predominate

Of the 35 planes in the Grand Palais, 30 are French construction, 2 are built by the Italian Ricci Co., and one each are by Ansaldo, of Turin, the Dutch Fokker Company, and the French Vickers Company. There are three triplanes, five monoplanes, and 27 biplanes. Of the triplanes two are Italian Ricci single-seat, cheap, sporting type machines and one the Besson flying boat. In the monoplane section Morane exhibits two of his parasol type planes; Lioré-Olivier has an all-metal scout machine and Hanriot also an all-metal special scout machine.

Commercial aviation is the dominating feature of the show, and although military machines are exhibited they are to be found only on the French Government stands, and not among planes shown by manufacturers. The industry has shrunk since 1918, as is shown by the presence of only 17 French makers of airplanes, of which the following is the list: Farman, Bleriot, Besson, Breguet, Nieuport, Mureaux, Caudron, Sanchez-Besa, F.B.A., Hanriot, Levassor, Lioré & Olivier, Morane, Potez, Tampier, Latecoere and Astra. Very few of these are occupied exclusively on aviation.

In the aviation engine section there are no exclusive makers of airplane power plants. The exhibiting firms comprise automobile manufacturers who maintain an aviation engine department, among them being Renault, Lorraine-Dietrich, Hispano-Suiza, Talbot-Sunbeam, and Peugeot, and makers who during the war were exclusively engaged on aviation engines but since then have had to take up other branches of engineering. These latter are Salmson, Gnome & Rhone, and Anzani. The Farman Company now builds both engines and planes, and the Breguet Company has taken up the construction of the Bugatti 16-cylinder engine for its airplanes. Airplane construction in France is being reduced to a small number of specialized firms having either none or only an indirect interest in the automobile industry, while aviation motor construction is being continued by a few makers who have specialized in this type of engine.

Big capacity commercial planes and all-metal construction are the features of the exhibition. Farman has the biggest plane in the show, this being a biplane with four Lorraine-Dietrich engines of a total of 1400 hp. driving two tractors and two pusher screws. The plane has a

total weight of 10 tons, of which, 4.8 tons comprise useful load. Its wing spread is 114 feet, its length 69 feet, and height 26 feet. Total wing area is 3229 square feet.

Breguet exhibits his Leviathan Type XXI all-metal plane in which duralumin is almost exclusively employed. In addition to the unfinished exhibition machine a finished duplicate is at the factory ready to undergo its trial flights. This biplane weighs 3 tons empty and has a load capacity of 3½ tons, with a speed at an altitude of 6500 feet of 105 miles an hour. Its range of action with a useful load of 2½ tons is 380 miles, and with a useful load of 2 tons 685 miles. The Breguet Leviathan is fitted with two 16-cylinder engines built in the Breguet shops to Bugatti designs; the two engines, which develop a total of 900 hp. drive a single tractor screw. One of the features of the new Breguet is the use of sheet aluminum for covering the wings. This is not employed in single sheet form, but in strips of 5 inches in width extending from the leading to the trailing edge. The edges of each strip are carried round and riveted to a metal rib. This type of construction has already been employed for the covering of fuselages, but its use is new for wings, and has not yet been experimented with in the air. Experience has shown that with unbroken sheets of aluminum as a wing covering there is a tendency for the metal to fracture in use; it is believed this will be overcome by the use of strips, and as the thickness of the metal is only half a millimetre weight is less than with linen covering.

## Another All-Metal Plane

Another all-metal construction is shown by the Latecoere Company, a concern which builds as well as operates airplanes. This firm exhibits the fuselage of a day bomber constructed entirely of duralumin. The complete wings are not shown, but it is stated that these will have metal covering. The plane has a wing spread of 86 feet, length 50 feet, height 20 feet and total weight 5-1/10 tons. The plane will be driven by four engines developing 1000 hp., and will have a speed of 142 miles an hour. A new big commercial plane by the same company is of duralumin construction with fabric covering for the wings. This machine, which is designed for 20 passengers, has a wing spread of 80 feet, length 46 feet, height 20 feet, and weighs 7 tons complete. It is driven by three Salmson water-cooled engines, with tractor screws.

Bleriot has also a 20-passenger plane of wood construction driven by four Hispano-Suiza engines of 275 hp. each. The engines are mounted in tandem each side of the main fuselage, there consequently being two tractor and two pusher screws. Normal speed is given as 124 m.p.h.

No direct sales are expected as the result of the exhibition, but the event is made use of to the full in order to create an opinion favorable to aviation. A congress is being held during the exhibition, and this, in addition to being of a technical nature and attended by experts, has a popular side comprising visits to the leading airplane factories, state laboratories, landing grounds, and the shops of aerial navigation companies.

## Things Seen at the Paris Airplane Show

# Entirely New Design Embodied in Mitchell Engine

New features include balanced crankshaft, hot spot manifold, unusually light cast iron pistons, pressure feed lubrication of main bearings, an improved combustion chamber form and a thermostatic valve in the cooling system. Quality of fuel marketed said to cause the change in design.

**A** NEW six-cylinder engine has been designed by the engineering department of the Mitchell Motors Co., Inc., to replace the engine that has formerly been used on Mitchell cars. In developing this engine the designers have aimed particularly at high engine torque at low speed, as well as at economical operation under these conditions, realizing that the average car engine is operated far more at speeds materially below that corresponding to its maximum horse power output than around that speed and above it. It has been sought to minimize internal friction by careful attention to the lubricating system and by accurately balancing the fly-wheel and crankshaft. Great pains were taken to get the cylinder bores concentric with the cylinder barrels in order to ensure, as nearly as possible, an even thickness of wall all around the cylinders. This tends toward uniform cooling and maintenance of a true cylindrical form.

One of the causes for revisions of engine design with many manufacturers has been the change in the quality of the fuel marketed, and this applies to the Mitchell. A new intake manifold has been produced which has a hot spot located at the top end of the vertical passage from the carburetor. This vaporizes the gas and carefully designed passages and bends with long sweeps tend to maintain an even distribution to all six cylinders. The design of the carburetion system is said to be such that the gas has no chance to condense again once it has been vaporized.

Among other points of interest on this new engine is the combustion chamber. As will be noted from the sectional view, the spark plug has been located in a spot

Camshaft bearing oil pocket layout

Details of oiling system

where there is a relatively large volume of gas, and it is evident from the design that turbulence in the combustion chamber has been aimed at. It will also be noted that the combustion space has been designed to extend well beyond the valve heads opposite the cylinder bores, so that when the valves are open there is a passage of less resistance for the gas into and out of the combustion chamber.

Structurally the engine is of the L-head, block-cast type with six cylinders of 3½-in. bore by 5-in. stroke, with a removable head. The S. A. E. rating is 29.4 hp., but on the block the engine has actually shown over 50 hp. The piston displacement is 288.6 cu. in. The crankshaft is statically and dynamically balanced and has force feed oiling to the main bearings, of which there are three. These bearings are 2¾, 2⅝ and 3½ in. long (front to rear) and all are of 2¼-in. diameter. The connecting rods and camshaft bearings and the gears and

The new Mitchell six cylinder engine

pistons are oiled by a constant level splash system. Cooling water is circulated by pump, and a Fulton thermostat is fitted to lessen the warming-up period and maintain a substantially constant engine temperature.

There are few encumbrances on the right side of the engine, only the starting motor, breather and filler pipe, and the water inlet connection being on that side. On the left side are located the inlet and exhaust manifolds, valves, carbureter, generator and ignition and the oil leads. While there are quite a number of units on this side, they have been so placed that it is still quite easy for a mechanic to adjust the valves. The bottom of the crankcase is of pressed steel, and its removal gives access to all bearings, no special wrenches being required to reach the end main bearings.

Much care has been given to the piston and rod assembly. The piston is of cast iron, but its sections are very light, so much so that it is possible to squeeze it into a slightly oval shape by hand. The thought here is to get a piston which will readily adapt itself to the shape of the cylinder bore. The piston clearance at the top is 0.010 in. and on the skirt, 0.003 in. The bearing surface is nearly equally divided above and below the piston pin. Three compression rings are used, and one oil scraper ring. The piston head, which is  $\frac{1}{8}$  in. thick, is slightly conical and is finished by polishing. A number of equally spaced  $\frac{1}{8}$ -in. holes are drilled in that portion of the piston between the two bearing surfaces, to relieve the pressure. Flats are cut on the piston immediately above the piston pin bosses, and  $\frac{1}{8}$ -in. holes are drilled at an angle of 25 deg. through which oil scraped into the flats by the ring above is forced into the piston pin bearings.

The connecting rods are given a better finish than formerly, and the set of six rods which go into an engine are balanced against each other, both as regards their rotating ends and reciprocating ends. In other words, the rotating or crankpin ends of the rods all weigh within  $\frac{1}{2}$  oz. of each other, and the same applies to the piston pin ends of the rods.

There are four rings per piston,  $\frac{3}{16}$  in. wide each. The piston pins are  $\frac{63}{64}$  in. in diameter. In order that

Tappet guide block, manifold, crankshaft and piston and connecting rod assembly

the piston pin may line up square with the barrel of the piston, the holes in the bosses are reamed in relation to the barrel to within a tolerance of 0.001 in. per in., measured with a plug projecting  $1\frac{1}{2}$  in. from the barrel.

Much has been done to ensure the easiest possible flow for the gases in and out of the combustion chambers. The water spaces around the valves have been materially increased. The valves have a clear diameter of  $1\frac{5}{8}$  in. and have a lift of 0.275 in. The tappets have been lengthened and are held in removable guide blocks. It is necessary to remove three horizontally placed cap screws from each assembly of six tappets, whereupon the guide block and tappets can be removed as a unit.

A counterbalanced crankshaft is now used. With the shaft supported at both ends and turning at 2000 r.p.m. the middle bearing must not run out more than 0.003 in. The shaft is very stiff and with the pressure system of oiling used a high linear speed on the bearings is permissible.

The lubrication system has been worked out very well, particularly in the matter of oiling the main bearings. A cross sectional view of the center bearing is

Section through cylinder head and top of block

Details of cast iron piston

shown in one of the accompanying illustrations. From this it will be noted that the oil is fed to the bottom of the bearings by a cross line which is connected to the main distributing line outside the engine by means of a T. The oil is carried behind the bearing metal in the cap and reaches the bearing surface through two small holes in the upper portion of the bearing near the dividing line. The holes are located on opposite sides and in a channel extending almost the entire width of the bearing. These channels, therefore, form a reservoir dam from which the oil is fed to the revolving shaft over the entire width of the bearing, which is said to be not always so when the oil channels in the bearings are cut from one side to another and cross in the center. The upper half of the main bearings is oiled by splash, the oil collecting in suitable pockets formed integral with the crankcase webs which carry the bearings.

The camshaft is also oiled by splash, suitable pockets

being cast above the bearings and so arranged with curved baffles which help throw the oil into the pockets. One of the features of the oiling system is the manner of attaching the outside oil leads and the drain arrangement. The connections between bearings are made by copper tubing, each section being made with a rise and fall. This allows for any variation in length and makes it possible to drain any of the leads without affecting the others. At each T there is a plug, the removal of which drains that particular lead. These form catch pockets in which settle foreign substances which may get into the oil, and once they have been trapped there is no danger of them being again set into circulation.

A change has been made in the timing gears. A steel camshaft gear is now used, in connection with fiber crankshaft and generator drive gears. The camshaft gear is very much lighter than the combination steel and fiber gear formerly used. This gives a quieter drive.

## Overhead Camshaft Engine on New Leach Power Plus Six

A SECTIONAL view in halftone is shown herewith of the six-cylinder engine of the Leach Power Plus car. This engine was designed by Harry A. Miller, who for years has been building special engines for automobile racers. It will be noticed that the design here shown embodies many features current in racing engine practice. The engine has cylinders of  $3\frac{3}{4}$  in. bore and  $5\frac{1}{4}$  in. stroke, and while the S. A. E. rating is only 33 hp., brake tests are said to have shown the engine capable of delivering 107 hp. The crankshaft is provided with balance weights.

The valves are located in the cylinder head and are operated by an overhead camshaft. The latter is driven by means of spiral bevel gears, as are the fan and water pump. An aluminum cover incloses the valve mechanism and side plates cover large hand holes in the sides of the

cylinder block, making all parts of the engine unusually accessible. There are no accessories or parts on the left side of the engine, which side is absolutely free, while on the right-hand side there are only the carburetor and manifold. The pistons can be removed from the engine either from above or below.

Large water spaces are provided on the cylinders, which extend down their entire length. Engine lubrication is by pressure feed. High economy is claimed for the engine, the car mileage being given as 14.5 on a gallon of gasoline and 2000 on a gallon of oil.

Changes have also been made in the chassis and body of the Leach six for 1922. The wheelbase has been lengthened to 134 in., new heavier springs have been fitted and shock absorbers eliminated.

# A New Make of Electric Truck

Series type resistance is used to facilitate gradual starting and acceleration. Motor drives through a silent chain, running in oil, to a jackshaft with differential, and thence to rear wheels by roller chains. Made in four sizes.

**A** NEW method of control which permits of very gradual starting and of speed variation by imperceptible steps has been brought out by O. B. Electric Vehicles, Inc. The firm will manufacture a complete line of trucks. All of the four models (1, 2, 3½ and 5 tons) are designed along the same lines. These trucks are equipped with a single G. E. motor which drives through a silent chain running in oil to a countershaft or differential shaft, from the ends of which the power is transmitted to the rear wheels by roller chains in the usual manner. The frame is made of rolled steel channels with the open side outward, which permits of securing brackets and other fittings to the inside with comparative ease. The spring hangers, which are riveted in place, are developed in the form of frame corner pieces. The two side rails have their ends bent at right angles so as to form one-half of each end cross-member, and they are joined together by fish-plates, inside and out, and rivets. The main frame members thus are identical in form and therefore interchangeable. This principle of making parts on the right- and left-hand sides of the truck alike and interchangeable has been followed throughout the design, and materially simplifies the service problem.

The battery is underslung between the front and rear axles. The battery box is made of angle steel riveted to the frame. There are guides on the floor for the battery trays, three trays being slid into the box from each side. After all of the trays are in place a crossbar is bolted in position in front of the trays, holding them securely in position. The battery box is covered by a sheet of compressed pulp which keeps out dust and water. Forty-four cell batteries are used on all models, which has been found most convenient for charging from 110-volt circuits. On the 3½-ton model the battery has a capacity of 300 ampere-hours.

The most interesting feature of the O. B. truck is the controller. It is of the resistance type, introducing resistance into the main circuit, which is gradually cut out. It will be understood that the single motor is of the series type, and its speed under any given load can be varied by changing the voltage impressed upon its terminals. This can be conveniently done by including

a variable resistance in the motor circuit. It is true that a certain amount of energy is lost in the resistance, but the idea is to use the resistance only in starting, while maneuvering and when caught in a traffic jam, and the total amount of time that any appreciable power is lost in the regulating resistance is comparatively small. On the other hand, the use of an almost infinitely variable resistance has the advantage that it permits of jarless starting from rest and of exactly suiting the speed to traffic conditions. The resistance used is the Allen Bradley type of current compensator, which consists of a stack of resistance material the resistance of which can be varied within wide limits by subjecting it to mechanical pressure. This compensator is combined with the O. B. controller. As the circuit is first

closed, the current is compelled to flow through the compensator with very little pressure on the resistance material, hence it encounters a great deal of resistance, little current flows into the motor and the latter exerts but a very moderate torque. As the controller handle is moved over further the resistance material is compressed, its resistance is reduced and the current flow and motor torque increase.

This continues until the resistance material is fully compressed and the resistance is at a minimum. There is only one more step on the controller, and that is with all the resistance cut out of the circuit. The controller is located under the driver's seat, and the handle extends up from the side of the driver.

The wiring from the battery to the motor and controller is carried in conduit in the frame channel on the outside. The wires are laid in grooves cut in two boards, which are placed with the grooved sides together. These boards are placed into the frame channel and the whole is then protected with a sheet metal cover.

Steering is through a spur pinion and sector reduction gear, with a large handwheel whose rim is wound with cord. The service brakes are of the internal expanding type and are of very large diameter. There is a pair of emergency brakes on the ends of the countershaft. Both brakes are equalized, and the operating devices of both are provided with ratchets by which they can be set in place.

One of the new O. B. electric trucks

As is customary in electric vehicles, anti-friction bearings are used throughout. The motor itself has ball bearings, and adjustable roller bearings are used in the front and rear wheels. For adjustment of the chain tension, radius rods are provided between the rear axle and the differential shaft housing. The turnbuckles on these radius rods are provided with square portions at the middle of their lengths to take a monkey wrench. This same plan of providing square wrench seats is followed out in the hub caps. Another feature bearing

on the servicing problem is that the squared portions of the hub caps of all models are of the same size, so the same size of non-adjustable wrench will fit them all. The wheels are of the Archibald wood type with two-piece felloe. The springs are of the Spring Perch Co.'s make.

All three lamps carried on the truck are of the same design, except that the rear lamp has one red glass. The trucks are sold with an equipment comprising the seat, lazy-back, footboard and cushion.

## Semi-Automatic Arc Welding

**A** SEMI-AUTOMATIC arc welding lead has just been developed by the General Electric Co. for use in conjunction with its automatic arc welding head, which retains the continuous features of the automatic apparatus, yet allows the operator to direct the arc as required by the conditions of the work.

The apparatus consists of a welding tool to be held by the operator, which acts as a guide for the electrode wire. In the handle of the tool, which greatly resembles an automatic pistol, is a switch for operating the control on the panel of the automatic welder to start and stop the movement of the electrode wire. Attached to the tool is a 10-ft. length of flexible steel tubing, called the "flexible wire guide," with an adapter on the other end for attaching it to the automatic welding head. The wire passes from the feed rolls of the head into the flexible tubing, and thence to the arc through a "guide nozzle" in the welding tool. The automatic welder functions in its accustomed manner, tending to hold the arc length constant, and the operator merely directs the arc

as required by the exigencies of the particular job.

The field of application of the semi-automatic is the welding of products where the seams to be welded are of very irregular contour, or on very large work where the travel mechanism and clamping necessary for the full automatic welder would be complicated and costly. In many cases the edges of the seams are not accurately prepared, making gaps in some places and tight fits in others. The automatic welder with mechanical travel cannot compensate for these conditions by varying the speed, or by manipulation of the electrode, but with the semi-automatic they are taken care of.

The semi-automatic welder may also be used for building up metal rapidly, as in the case of the filling up of blow holes in castings, or the building up of worn spots, etc. The speed of deposition of the metal varies widely, being somewhere between the ordinary hand speed, and that of the automatic, according to the conditions of the particular job. In general it is about twice as fast as hand welding.

Semi-automatic electric arc welding outfit developed by General Electric Co., Schenectady, N. Y.

# Weather Protection on British Open Cars

Sudden development in framed side panels for folding tops evident at the Olympia show. Standardized rear cowl on Humber. Combined side panel and rear screen on Swift. More than a dozen makers adopt the scheme, either offering the panels as standard equipment or at an extra cost.

By M. W. Bourdon

**A**N outstanding feature of the open body designs exhibited at Olympia was the large number fitted with means better than the ordinary detachable side curtains for affording weather protection to passengers.

At the shows of 1919 and 1920 standard cars were alone in providing framed side panels with transparent centers for the folding tops, but at this year's show there were more than a dozen British makes using some variation of the Standard scheme. This sudden consideration for passengers' interest is due, without question, to the popularity and practical success of the originator's arrangement, and without suggesting for a moment that Standard cars have not many other points of appeal, it can safely be said that the almost completely justified claim that they combine the protection of a sedan with the advantages of an open car has been a sales argument of no little weight.

The accompanying sketches illustrate eight different arrangements. In some cases this "all-weather" feature is standard equipment furnished with all open bodies; in others rigid framed panels are an extra, as with Wolseley and Enfield-Allday. As will be gathered from a discussion of individual designs, most of the front panels can be used as side wind deflectors when the top is folded; on the Swift four-passenger the units—each consisting of three panels and extending to the back of the rear door—can be utilized at the sides for this purpose, or as a rear shield; but others depend upon the top for partial support and cannot be used with the latter down.

In all cases some provision is made for storing the side panels when they are not in use. Usually there is a tray under the front seat. Not all methods are effective in preventing head draughts entering between the valance of the top and the upper edge of the side panels; further, not all open with the doors automatically, a

few needing some form of clip or turn-button to be released as a preliminary.

**Humber.** To apply this scheme to the best advantage, inside and outside door handles are required, and these are found in a few examples—Humber and Standard, for instance. The Humber application, Fig. 1, is on lines similar to the Wolseley, so far as the means of anchoring the rear corner of each over-door panel is concerned. A flat steel tongue drops into a neatly fitted socket in the door frame, though the Humber

"tongue" is not so conspicuous as that of the Wolseley. Humber provides four transparent panels on each side of the four-passenger cars, arranged as three separate units; over the front door, alongside the front seat and over the rear door, and behind the rear door.

The front unit has a flap extension of the fabric which incloses the flat metal framing

of the transparent panel, and this flap is secured top and bottom to the fixed vertical pillar of the shield, the fabric thus forming a flexible "hinge" which eliminates the need for precise alignment of door and curtain hinges. The front panel of the central unit is secured by turn-buttons to an inner valance of the fabric top and to the body side in the same manner, and forms the support of the fabric "hinge" for the panel over the rear door. The third unit is also secured by turn-buttons at top, bottom and rear edge.

The inner valance running the whole length helps prevent draughts passing in over the tops of the panels, and to the same end the free top corners of the over-door panels normally spring inward from the vertical so as to press firmly against the frames of the units against which they abut when closed. For storing the panels a locker is provided under the front seat.

This provision is found as standard on all Humber open cars. The 16-hp. five-seater has in addition a rear cowl hinged to the back of the driving seat and sup-

Fig. 1—New 11-hp. Humber with standard four-passenger body and folding top with framed side curtains that open with doors

Fig. 2—Humber rear cowl and shield, one of the latter half-entered in its storage pocket. Fig. 3—11 hp. Standard. Fig. 4—Albert. Fig. 5—Wolseley

porting on its rear edge a pair of detachable windshields. The transparent portion is thick non-inflammable celluloid, and each shield can be removed by unscrewing two thumb nuts and stored in one of a pair of horizontal pockets formed in the cowl with slot openings at the rear. To assist in raising the cowl a hinged telescopic tube with a stiff helical spring inside is fitted at the center just below the hinge.

This cowl and windshield fitting can be used with or without the side curtains and whether the top be opened out or folded. It is also removable entirely by drawing out the hinge pin, leaving only a neat half-hinge on the top of the front seat panel. When raised with the front seats occupied the windshields are horizontal and well over the heads of the occupants, and the cowl cannot fall forward because of the stop provided by the telescoped tubes.

As the accompanying sketch (Fig. 2) shows there is a space between the two shields. This permits a certain amount of draught, but not so much as might be imagined, as, owing to the front windshield the air currents are not direct. The reason for this separation of the shields is to allow them to be stowed away in the pockets provided in the cowl, the curvature of the latter preventing a single and full width shield being accommodated in this way. At present Humber is the only British maker with a standardized body supplying anything of this kind.

**Standard.** The sketch showing the Standard side cur-

tains (Fig. 3) is almost self-explanatory; it need only be said that the darkly shaded portion is a detachable valance or strip of thin leatherette—the material used for the top itself—this strip being secured to the framing of the top by snap buttons and pierced to take the short leather straps which support the top edge of the central panel. The strip is also a draught excluder.

**Albert.** The Albert front panels are also secured to the windshield standard by snap fasteners on extension flaps of the fabric which surrounds the celluloid panels. But the fabric does not inclose a full metal frame as in most other cases, there being merely two round section uprights to keep the panel as a whole taut vertically. The peculiar shape of the bottom extension of the rear upright is evident in the sketch (Fig. 4); it is formed thus to enable it to swivel outward in the socket on the door to avoid dragging and straining the panel when the door is opened and to allow the inside door handle to be operated from outside the car. Within the door panelling is a spring which normally tends to keep the panel tight against the door and adjacent curtain. In this case, also, an inner valance is fitted and has the center panel (alongside the driving seat) attached to it by turn-buttons; but it is not, as in the Humber, stitched to the fabric of the folding top—merely to the top bows at three points—so that draught exclusion is by no means complete. As in the Humber there are three units, the central one of two panels and the rear-most alongside the back seat.

Fig. 6—10 hp. Swift. Fig. 7—12 hp. Swift. Fig. 8—12 hp. Swift, side curtains used as rear screen. Fig. 9—Riley  
Fig. 10—Sunbeam. Fig. 11—Enfield Allday

**Wolseley.** As with the majority of these open-with-door side panels, the Wolseley arrangement has evidently been adapted to an existing folding top. To exclude draught where the top framing overhangs the screen pillars, a wood filler piece has been attached to the corner of the front bow and from it hangs a short valance; this somewhat makeshift feature is indicated in the right-hand inset sketch of Fig. 5 herewith. The left-hand inset shows the slotted plate by which the hinge flap of the front panel is secured to a stud on the windshield post. In this case, as in the Albert, the metal framing within the fabric surround of the celluloid is not complete, consisting merely of a flat steel upright at the rear end dropping into a socket on the door.

**10-hp. Swift.** The fabric in this arrangement (Fig. 6) is supported by a full frame of flat steel, the latter being exposed on the inside and having cranked steel "pegs" of round section riveted to it. These pegs, one back and one front, drop into holes in the door tops,

while the "hinge" is again of fabric attached to the windshield pillar. The rear lower corner has a triangular fabric flap, serving two purposes, (1) to allow one of the occupants to extend an arm for signalling to other drivers, and (2) to enable the inside door handle to be operated from the outside. No special provision is made for excluding draught over the top of the panel.

**12 hp. Swift.** As already mentioned, one of the "curtains" of this car can also be made to serve as a three-panel rear seat shield and is shown in use as such, in Fig. 8. But it should first be said that the complete side panels—three in all—form a single unit on each side, the front and back sections being hinged by the fabric to the central one. At the front the unit is secured to the tubular pillar of the windshield by spring clips, as shown in the left inset view of Fig. 7. A secondary interior valance of the fabric top serves to exclude draught and to support the upper edge of the central panel, a sectional view being given in the upper inset of Fig. 7,

taken at the back of the side opening. A signalling flap at the bottom of the central panel is normally held closed by a metal tongue projecting inwardly over the bottom framing. The latter is exposed to the interior and has the fabric surrounds of the celluloid riveted to it. Two pegs drop into sockets below the central panel, as indicated in the right-hand inset, the holes in the tops of the body sides having rubber sleeves let into them to prevent rattle. The rear corner of the back panel is held closed by a "bolt" of 3/16-in. wire bent to a right angle at the top.

One objection to this arrangement, as it is applied, arises from the doors and panels hinging at opposite ends in respect of both front and rear entrances. Thus the panels do not open with the doors but must be manipulated independently. Further, the U-shaped spring clips at the front edge are not ideal and will either break or the unfastening of them will cause the fabric to be strained and torn, though a leather tab is attached to the top corner to serve as a hold.

A side unit serving as a rear shield is seen in Fig. 8. There are two rubber lined holes in the back of the front seat for the pair of pegs on the central panel, and at each lower corner of the side panels is a "bolt" to locate the ends by dropping into a slotted socket on the body sides. Used as a windshield, the fitting is by no means rigid, but it is almost as firm as the majority of the extending arm rear shields pure and simple. It should be quite as effective as a means of protection when the triangular corner pieces of fabric which are provided are fitted to fill the spaces in front of the side panels and inside the doors.

Riley. This application occurs on a two-door, four-passenger body (one wide door in front at each side and tip-up front seats). The fabric surrounds inclose a flat section steel framing which at its top front corner has a horizontal wire ring extension at right angles to form a hinge when it is dropped over the stud at the top of the windshield pillar, this stud serving primarily as an anchorage for the folding top (see inset in Fig. 9). At the rear the panel framing is secured by snap-buttons to a steel tube of square section which drops into a somewhat unsightly socket on the door. A second shallow valance is stitched to the fabric top as indicated in the sectional portion of the sketch, but finger manipulation is needed after the door and panel have been closed to push the outer valance outside the top edge of the surround. The rear panels are fixed by turn-buttons at bottom and rear, but at the top, as in the case of the front panel, flat spring steel hooks are used to hold the inner valance to the surround.

Sunbeam. This embodies a distinct improvement on

most of the other arrangements in regard to the hinging of the panels over the doors. Attached to the top of the windshield pillar in vertical alignment with the exterior hinges of the doors is a rearward elbow with an extension at right angles projecting down. This extension is cylindrical and contains a spring-backed plunger with a spherical bottom end. The fabric surround of the celluloid has a flat steel framing at top, bottom and rear, but at the front the flat steel is secured to a round section vertical rod, inclosed in the fabric excepting its projecting ends; the latter are cupped, the top one engaging with the spring backed plunger which presses the lower one on to the top of the pin of the door hinge. This system, which affords a neat, workmanlike and draught-proof fitting, is illustrated at the right of Fig. 10. On the left of the sketch are seen the hinged arms by which the back corner of the panel is held to the door, and the finger hook for drawing the panel inward. These hinged arms are needed to enable the door to be opened from the outside of the car, for interior handles only are provided; also they allow the "window" to be pushed open for ventilation.

Enfield-Allday. The scheme adopted by Enfield-Allday (Fig. 11) differs fundamentally from all others, for no attempt is made to arrange hinged panels or to make the latter open with the doors. There are two panels at each side of the car (a four-passenger, four-door body), and by means of four steel hooks—two for each—they are hung from horizontal rods attached to wood filling-in strips under the valance of the folding top. A guide plate fitted to the body side between the doors, prevents flapping at the center when all is closed up. The two central hooks on the panel frames are inverted in their position on the rod; that is to say, the back hook of the front panel is fitted behind the front hook of the back panel, this arrangement allowing either unit to be moved forward or backward without disturbing the other. So, as shown at the center of Fig. 11, the panels are slid rearward to open the front door; and vice versa.

The wood filling-in strip under the valance at the front end of the top is a fixture with its section of "curtain rod" and folds back with the top. But the rear one is detachable and must be removed before the folding process commences; it is secured by a couple of pegs at one end and a turn-button at the other end. A feature of the folding top unconnected with the side panels is a concealed spring within each rear support, the latter of square section steel; by this means the top unfolds itself and carries the front bow to the windshield, after it has been given an initial lift and light forward push.

## Loading and Unloading Devices

IMPROVEMENT in road transport can be brought about by educating the motor car user to an appreciation of the importance of doing away with delays in loading and unloading at terminal points. This fact is strongly emphasized in the London Times, which declares that these delays and failure to overcome them have offered definite sales resistances in several instances. Blame cannot be wholly placed on either the manufacturer or the user, although a good share of it can be laid at the door of the latter, since failure of proper organization is largely responsible. The manufacturer, on the other hand, has perhaps not given thought enough to this feature in the design of motor trucks.

Loading equipment, however, does not come within

the scope of the automobile manufacturer, but a bit of propaganda emanating from the automobile factory, emphasizing the need for organization and proper facilities might have the tendency to overcome this sales resistance. The manufacturer, of course, has been discouraged from equipping trucks with such devices because he has heard from far and wide the demand to "cut costs." Cost cutting cannot well be accomplished with the addition of equipment.

Motor truck salesmen, however, could probably extend their replacement market, as well as develop new fields, were they to educate the motor truck users in methods and means of reducing the time required at loading and unloading stations.

# Gear Tooth Shape and Its Relation to Standardization

The properties of the involute form of gear tooth are discussed. True involute teeth with a certain pressure angle and relation between addendum and diametral pitch will not interfere with pinions down to 12 teeth. Such a system would facilitate universal interchangeability.

By E. W. Miller\*

**F**OR standardization none probably will contend for a tooth design other than involute. Those who have studied gear teeth for many years appreciate that the number of possible gear tooth curves is almost infinite. The vast majority concede the decided superiority of the involute to any other as yet discovered. It is, therefore, suggested that the involute system only be considered.

Let us think about an interchangeable system. Let this system consist of all members from 12 teeth to a rack, inclusive. It is understood that each member of the system will run satisfactorily with any other member. The advantages of this plan are obvious. The gear manufacturer may make up a quantity of gears with various numbers of teeth and carry them in stock. This not only permits of quantity production with its lowered costs, but assures quick delivery, which is many times a vital factor. Further, the matter of blank size and depth of cut is simple, and a matter of importance when, as often is the case, the best of help is not procurable. If an interchangeable system results in less spoiled work, this factor should be considered in weighing the matter. With the obvious advantages of a standard for gear teeth and an interchangeable system, it seems conclusive that a standard interchangeable system is desirable. This would insure interchangeability of the different gear members made up in various plants. Further, the customer could easily specify his requirements and know whether his order brought him the proper gear or not.

The involute curve stands pre-eminent in the field of gearing. With teeth shaped to involute outlines, gears are to-day performing feats which a few years ago with other shapes seemed impossible. The involute is not alone responsible for this advance, but it has been a great factor, due to the comparative ease of its duplication and ability to operate properly at various, and sometimes varying, center distances. We, therefore, turn with interest to the study of this curve.

## Theory of the Involute

The involute is that curve traced by a point on a cord as the latter is unwound from a cylinder. This cylinder is known as the base circle. Fig. 1 makes this plain. The pencil point fastened to the cord traces the involute curve as the cord is unwound from the base circle. In Fig. 2 a card is attached to a base circle of the same size and a cord carried by the same is passed over an idler

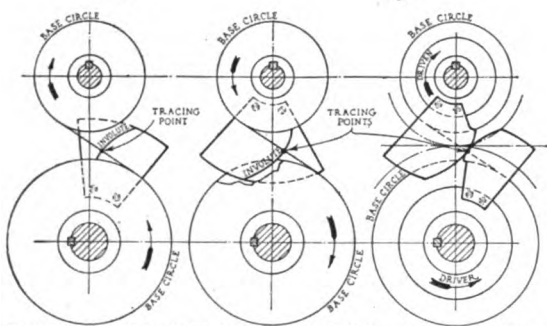

pulley. If the cord is pulled in the direction of the arrow, with a frictional resistance applied to the base cylinder, thus keeping the cord taut, the base circle with the card will rotate in the direction of the arrow, and a tracing point in the cord will draw a curve on the card. Obviously, the curve developed is identical to that traced in Fig. 1, since each curve has been traced by points on a cord unwound from base circles of identical diameter.

## Involute Traced on Recording Card

Fig. 3 shows a pair of disks, the upper being two-thirds the diameter of the lower. If the cord with the tracing point be wrapped about the two disks and the lower provided with the recording card, an involute will be drawn upon that card as the upper disk is rotated, winding up the cord and unwinding from the lower member. In similar fashion an involute is traced on a recording card mounted upon the smaller disk, as shown in Fig. 4. If the cards are cut carefully on the involute line and mounted as in Fig. 5, it is plain that as the cord is wound upon the one disk and unwound from the other, the two cards will be in continuous contact at the tracing point, since the curves are simultaneously traced by that point. If the travel of the cord is uniform—that is, moving constantly an exact distance in an exact period of time—it follows that the contacting of the involutes takes place uniformly along the path taken by the tracing point. If the cord is removed and one disk member is rotated uniformly, the other disk will also uniformly rotate, since its rotation is brought about by contact of involutes developed by the same tracing point. The straight portion of the cord is called the line of action, because contact of the involute surfaces takes place along this line.

In Fig. 6 are shown two base circles of 3- and 6-in. diameter. A cord wound about the two and tightly drawn is assumed to have developed the two involutes shown through the medium of a tracing point therein. It is apparent that two complete revolutions of the 3-in. circle will wind up an amount of cord equal to the circumference of the 6-in. circle, and will thereby cause one complete revolution of the latter. It is also known from previous demonstration that involutes I and F will be in continuous contact along the line of action, the contact beginning at P and ending at S. If several involutes, as I and F, are properly spaced about their base circles, and the base circle of 6-in. diameter is rotated continuously, it follows that the set of involutes carried on the larger, engaging those on the smaller, will at each revolution cause two revolutions of the smaller. The

\*Condensed from a paper recently presented before the American Gear Manufacturers' Association. The author is chief engineer of the Fellows Gear Shaper Co.

two base circles cannot be brought into contact, for in that case the tracing point on the cord wound about the two will follow around these cylinders, defining the same. The two would appear as rolls in contact, the one being driven by the other only through friction. If an appreciable load is to be carried, projections must be provided to assure positive contact. In order that these projections may be utilized the base circles must be separated. If from the base circle centers other circles having the same diameter ratio as the base circles are drawn tangent to each other, we may consider them as a pair of properly proportioned disks upon which may be located involute projections developed from the base circle, thus effecting a positive drive. These circles are called the pitch lines. Their point of tangency is called the pitch point. The pitch point is also defined as the point at which the line of action crosses a straight line drawn through the base circle centers. The common tangent is a line at right angles to the line of centers and passing through the pitch point. The pressure angle is the angle which the line of action makes with the common tangent.

In Fig. 7 is shown a pair of base circles with templates and involute shape obtained as in Fig. 5. The cord wound about the two disks represents the line of action. If the two centers are further separated, as in Fig. 8, and both disks are free to rotate upon their centers, the cord will inevitably keep the profiles in contact, since the involutes cannot possibly escape from the tracing points which define them. It is apparent, too, that the line of action makes an increased angle with the common tangent, denoting increased pressure angle. The pitch point also appears in a new position.

Fig. 9 shows two base circles, A and B, of identical diameter. Involute I and F have been developed from these base circles by methods previously described. It is assumed that the two involutes are securely fastened to the base circle. If involutes I and F are mounted on the back face of the disks, they may act as means of rotation, permitting the installation of a recording card and tracing cord with tracing point as shown. As F is rotated in the direction of the arrow, thus driving I, contact of the two involutes takes place along the line

of action. The recording card is of rectangular shape, running on guide pins, and free to move endwise. In Fig. 10 is shown an end view of the recording card, having a fin of infinitesimal thickness. This fin is tightly pressed by the pitch cylinders at K, and it is assumed that their rotation causes endwise movement of the recording card at exactly the peripheral speed of the disks and at right angles to the line of centers. If the tracing point is pulled along a distance E, any point in the base circle obviously moves the same distance; but a point in the pitch circle moves a greater distance by an amount in direct proportion to the ratio of the radius of the pitch circle to that of the base circle. Therefore, when the tracing point moves a distance E, a point on the recording card moves a distance S. Evidently then

$$S = \frac{R}{T} \times E.$$

It should be plain that line M is traced on the recording card as the tracing point travels the distance E, and the starting point on the card moves distance S. M is the resultant of both forces acting in a straight line. Therefore, M also is a straight line.

#### In Simultaneous Contact

The involutes I and F and the straight line M have all been traced by a point in a cord being wound upon A and unwound from B, and the three are in simultaneous contact in any position along this line. Note the contact at C. It can be mathematically determined that line M stands perpendicular to the line of action. It will be noted from observation of the straight line JJ that this line has been drawn at an angle other than 90 deg. with the line of action and tangent to involute F. It does not pass through the point of contact of involutes I and F, and, therefore, does not meet the conditions for satisfactory operation with the involute curve. From all this it is evident that a member traveling in a straight line tangent to a circle struck from a base circle center must be provided with a straight edge or tooth to properly engage a surface of involute outline. This straight tooth member is known as the involute rack.

In Fig. 11 is a base circle X, and tangent to the same is drawn a straight line P representing the line of action. Straight lines perpendicular to line P will evidently function properly as involute rack teeth, since they fulfill the conditions already set forth of being straight and at right angles to the line of action. The line OO is drawn through the intersection point of one of the straight lines and the line of action. The center of circle X' is the same distance from this intersection point as is the center of circle X. Circles X and X' have the same diameter. The line of action becomes also tangent to X'. Here is a condition like that in Fig. 9, and it is evident that the pitch point P is determined by the distance in a straight line from the center of the base circle to the intersection of line B with line of action. This is represented by line N. The common tangent of the gear pitch circles becomes the pitch line of the rack. The pressure angle, being the angle which the line of action makes with the common tangent, is determined by the direction in which the straight line

acting as a rack tooth moves. Obviously, the length of the gear pitch radius (as line N) determines the common tangent, thereby establishing the direction of travel and pressure angle. It is interesting to note the effects of the lengths M, N, J and K. They result in the various rack pitch lines indicated, and the pressure angles 60 deg., 45 deg., 30 deg. and 15 deg. If the radius Z were used as a pitch radius, the straight line representing the rack tooth becomes a point. Its direction of travel is that of the line of action, and its pressure angle is zero. The gear pitch radius must intersect the line of action. Base circles must have radii of some length, as, for example, Z. It is, therefore, apparent that, however great we may imagine the pitch radius to be, it must still make an angle (admittedly slight) with the line of action. We conclude from this that the greatest theoretical pressure angle is almost 90 deg., but never quite so.

It has been demonstrated that a change in base circle center distance affects the pressure angle of two involute

Fig. 9

Fig. 15

curves developed from these circles. This is not true when involute and rack are brought into contact. It has been demonstrated and laid down as fundamental that the line of action must lie at right angles to the rack tooth line. Fig. 12 shows these members in mesh at distance A. Fig. 13 shows distance A appreciably increased and indicated by B.

In order to keep the line of action at right angles to the rack face, the pitch point has moved a distance equal to C, and established a new position for the rack pitch line. It is noteworthy that increasing the distance of base circle center from rack has not affected the pitch circle of the involute. From the foregoing we may make the following conclusions concerning the involute curve, the term involute being used in a broad sense, as being of an indefinite length, and not confined to our usual conception of a gear tooth:

#### Properties of the Involute

The involute is wholly determined by the diameter of the base circle.

An involute moving about its base circle center imparts rotative motion to a contacting involute in the exact ratio of their respective base circles.

An involute has no pressure angle until brought into contact with another involute or a rack.

The pressure angle is determined by the center distance of the base circles.

The pressure angle once established is constant.

An involute has no pitch diameter until brought into contact with another involute or a rack.

The pitch diameter of an involute contacting another involute is determined by the center distance.

The pressure angle of an involute contacting a rack is unchanged when the base circle center is moved toward or away from the rack.

The pitch diameter of an involute contacting a rack is unchanged when the base circle center is moved toward or away from the rack.

The pitch line position of an engaging involute and rack is determined by the intersection of the line of action with a line passing through the base circle center and perpendicular to the direction of rack travel.

#### Fraction of the Involute Used

The involute curve has its origin at the base line, but its length may be anything from zero at the starting point on to infinity. The tracing point carried in a cord, being many times unwound from the base cylinder, may extend the involute to any desired length. An example of involutes developed by unwinding the cord one complete circumference of the base circle is presented in Fig. 14, which results, as shown in a pair of one-tooth gears, in theoretically perfect action. The application of the involutes as here arranged offers an interesting study. Although of little or no value as actual driving members, the extremities at which involute action may take place are here made plain, and the nature of the curve made clearer.

It will be noted that each of the two involutes constitutes an unsymmetrical tooth. If A acts as a driver, turning in the direction indicated by the arrow, B will rotate in the opposite direction. Contact will take place along the tracing cord exactly as in cases previously cited. The length of the line of action represents the circumference of the base circle, and in this case is the normal pitch of the involute. It is rather startling to realize that the circular pitch of these two involutes developed on a base circle of only  $1\frac{1}{2}$  in. is 15.537. It is of passing interest to note that the pressure angle must

always be 72 deg. 21 min. when a single involute effects complete rotation of a single engaging involute. The pressure angle of 72 deg. 21 min. is excessive, and these curves are obviously incapable of transmitting any but the lightest loads. The diagram, however, is of value in explaining the possibilities of the involute.

Practically to transmit power smoothly and positively from one pitch line to another it is necessary to provide a number of teeth, thus permitting a selection of that part of the involute best suited for the purpose. In Fig. 15 a long involute I has been developed from the base circle B. Any point on this involute may be taken as determining a pitch diameter upon which teeth may be produced, the number of teeth being determined by the service required. Circles C, D, E, F and G. represent such pitch lines. Upon these pitch circles teeth have been drawn and one side of a tooth upon each pitch circle is composed of involute I. Teeth of various pitches have been drawn to make plain the possibility of a wide choice. The pressure angle increases as the larger pitch diameters are utilized. In the case of circle C it has reached 60 deg. If, after due consideration, it is decided to produce teeth on circle D to run with similar teeth on a pitch circle of identical diameter, it is necessary first to establish the center distance. Since the two gears are to be of equal pitch diameter, this center distance is determined by making L equal R. Then the center of the mating gear is at O'. A base circle A described from O' and having the same diameter as B becomes tangent to the line of action. Involute developed from this second base circle A and so spaced on line M as to accord with the tooth spacing on D will operate satisfactorily, provided—

1. That there is no involute interference.
2. That there is an ample arc of action.
3. That excessive slippage is avoided.
4. That a proper pressure angle is selected.

These four points are of vital importance in our standardization work, and each will receive careful attention.

#### Base Circles and Center Distance

The use of diagram 15 is an effort strongly to emphasize that the base circle is root and seed of the involute and is an attempt to ground our thinking in terms of base circles and center distances. These are the fundamentals, and they should not escape us. On the other hand, it is not recommended that the procedure followed in Fig. 15 be used as common practice. The base circle-center distance attitude of mind is most important in determining the standards. Once the best portion of the involute is determined, center distances may be standardized, determined from the diametral pitch employed, thus following present-day practice.

Two engaging involutes contact along their line of action, and the driver, if uniformly rotated, imparts uniform rotation to the driven. If, however, the involute length is so great as to extend beyond the point of tangency of the base circle and line of action of the mating gear, the uniform rotation of the driven member ceases. The involutes are said to interfere. The point of tangency is called the interference point. In Fig. 16 two involutes, I and F, are assumed to have been contacting steadily along their line of action, the driver I causing uniform rotation of F. When point J is reached, all involute action ceases, since obviously involute F cannot extend below the circle upon which it has been developed. The continued, uniform rotation of A causes I to drive B, the contact of F being always at J. For purposes of illustration the involute length is determined by a 4-in. radius. The base circle radius is 2 in. With

these radii it is plain that as A is rotated a point at the 4-in. radius will move twice as far as a point at the 2-in. radius. A tracing point carried on the line of action will, after arriving at J, be wound upon base circle B, its path thus bending inward and away from the straight line representing the line of action. If this tracing point is assumed to have traveled from J to K (which is the intersecting point of base circle B with circle C) it is apparent that a point in C will have moved twice this distance. If, then, a distance twice JK, indicated by NM, is laid off on circle C, beginning at point N, which represents the end of involute I, it is found that M, representing the extremity of this line, lies outside the base circle B. To have moved in unison J and N should have come together at K. Actually when J has reached K, N has arrived at M. This means that, as A is uniformly rotated, the rotation of B is gently accelerated.

In this same figure a rack tooth R is shown engaging involute I'. If a point on base circle A moves from J' to P, a point on the pitch diameter moves the distance DE, as does also any point on the rack pitch line. Laying

off this distance on a line parallel to the rack pitch line and passing through the end of the rack tooth at G, the left-hand extremity is located outside the base circle at P. This again evidences interference. To entirely avoid interference the rack tooth should be shortened to length Y when operating with I'. When I and F are operating together, the involute length should equal to N. The difference in Y and N is appreciable, indicating the greater tendency of the rack tooth to interfere.

When involutes take the form of symmetrical teeth, employed in the transmission of power, the presence of interference prevents operation. This is made plain by Figs. 17 and 18. The acceleration of the driven member B, Fig. 17 (as explained by Fig. 16), is prevented by positive contact of teeth C, D and E; likewise, in Fig. 18, the rack R driving A cannot accelerate the rotation of A by reason of the contact of teeth C, D and E. This assures that gears and racks with teeth extending beyond the interference point will positively lock, becoming inoperative.

The addendum of a gear tooth is known as that tooth length which extends above the pitch circle. The deden-

dum is the tooth length below the pitch circle and equal to the addendum. The clearance represents extra depth of cut to assure space between the bottoms of the teeth and the ends of the mating teeth. The sum of the addendum, the dedendum, and the clearance equals the whole depth of tooth. The circle representing the outside diameter of the gear is sometimes called the addendum circle. Fig. 19 makes plain the application of the various terms.

### Arc of Action

The arc of action is that arc through which a gear tooth moves from the point at which it first contacts a mating tooth to the point at which the contact ends. Fig. 20 indicates two gears in mesh. Contact in this diagram begins at the intersection of one addendum circle with the line of action (note points B and B'), and ceases at the intersection of the line of action with the addendum circle of the mating gear. (Note points A and A'.) It is important that a pair of teeth shall remain in engagement until another pair can engage, thus taking up the load. If this does not occur, the gears operate with a bumpy, jerky motion, and they are said to fail of continuous action. The convenient term, "normal pitch," has been used to define the distance from one side of a tooth to a corresponding side of the next tooth measured on the line of action. This obviously is the circular pitch of the gear measured on the base circle, since these corresponding sides are traced by points fixed in a cord unwound from the base circle. The normal pitch arc is established by a length on the base circle equal to the normal pitch. It is evident that the actual arc of action must be greater than the normal pitch arc to assure continuous action. In the case shown the actual arc of action greatly exceeds the normal pitch arc. The maximum arc of action is obtained when the addendum circles pass through the interference points, as indicated by the dotted lines in the drawing.

### Reduction of Sliding Action

The slippage is an element which deserves careful investigation. It obviously should be reduced to a minimum, approximating rolling action as nearly as possible. In Fig. 21 two involutes developed on base circles at center distance Z are in contact at the pitch line. Beginning at the involute origin the base circles have been spaced in equal divisions, as indicated by Nos. 1, 2, 3, 4, etc. If we still think of the cord with its tracing point, it is plain that when unwound from arc No. 1 it has developed the involute length 1'. It is of great importance to note that although 7 exactly equals 1, the length of involute 7' is several times greater than 1'. It is also plain that when these angles have moved to such a position that lines L and N, representing the tracing line, lie in the line of action, length 1' will begin to pass over length 7'. An angular movement equal to 1 of the base line divisions causes 7' to pass completely over 1'. The difference in these two lengths evidences excessive sliding. From this it is evident that the extremely short length 1' is responsible for a very considerable arc of movement. It is noteworthy that lengths 4' contacting near the pitch line are identical, but due to the position they take a slight slippage occurs. The straight line diagram shown in the lower position of this figure furnishes a simple and convenient means of comparison. The percentage of slippage is here indicated. In Fig. 22 the same base circles and involutes are employed, but the center distance is increased an amount Y. The effect of this is to greatly increase the pressure angle, and it results, as reference to the lower diagram will evi-

dence, in a great reduction in slippage. Although the total length of the involute is identical with Fig. 21, less of the involute is utilized, having the effect of a shorter tooth.

Attention is called to the marked bend of the involute near the base circle. The straight length C laid off on a radial line passing through the origin of the involute departs markedly from the involute. The same length C', laid off perpendicular to line B, deviates but little from the curve. It is plain that the farther the involute extends from the base circle the more nearly it approaches a straight line. The nearer two mating involutes approach a straight line, the less they slide upon each other, as has been evidenced by the slippage diagram. The greatest curvature is near the base circle. Therefore, this portion is most responsible for tooth slippage. It may be logically concluded that the active profiles of engaging teeth should be kept as far as practicable from the base circle.

The pressure angle is of great importance in determining an interchangeable system. Together with the addendum, it determines the possible range of involute action between the various members. It is common to make the addendum equal the reciprocal of the diametral pitch. For example, the addendum of an 8-pitch gear is made  $\frac{1}{8}$  in. As a starter it may be well to determine the necessary pressure angle to secure interchangeability of all members from 12 teeth to a rack when the addendum equals the reciprocal of the pitch.

### Minimum Pressure Angle

The two extreme members—namely, the 12-tooth pinion and the rack—obviously present the limiting case. In Fig. 23 is shown a 12-tooth pinion of one diametral pitch. The problem is to find the pressure angle which shall fix the interference point in line AA'. Using a right triangle, as shown, let the point N lie in line AA'. Shift the triangle about, keeping N in AA' until side T passes through point O and side R through D. Draw CO and CD. The angle COD is the desired pressure angle. It may be mathematically checked by simple triangulation. In Fig. 24 a pair of 12-tooth pinions is observed to clear the interference points by a wide margin. Obviously a 24-deg. 4-min. pressure angle assures an interchangeable system.

One factor to be considered when determining the pressure angle is its effect on bearing loads. The example shown in Fig. 25 may serve to illustrate this matter. A pitch line force EO coming against the inclined surface of a gear tooth resolves itself into force FO, acting along the line of action, as shown. D graphically indicates the amount of load increase by reason of the pressure angle. It is apparent that the increase is in ratio of EO:FO of the right triangle OEF, and is, therefore, proportional to the secant of the angle. The table drawn up herewith gives the secants of several angles. The column on the right compares the load with 14½ deg. in terms of percentage.

Angle	Secant	Comparison of Load with 14½ Deg. in Percentage Terms
14½ deg.	1.0329	
17 deg.	1.0456	1.2 per cent
20 deg.	1.0641	3.0 per cent
22½ deg.	1.0823	4.8 per cent
24 deg. 4 min.	1.0952	6.0 per cent
27½ deg.	1.1273	9.1 per cent
30 deg.	1.1605	12.3 per cent

In Fig. 26 are shown two 12-tooth pinions in mesh. The pressure angle is 24 deg. 4 min. Above is shown a rack engaging a pinion. In full line the teeth of both pinion and rack are shown having an addendum of 0.8 in. The normal pitch is 2.868, and the excess engagement of the two pinions is 0.4 in. This indicates 14 per cent

more travel than is actually necessary to effect continuous action. The rack and pinion, as shown above, have 25 per cent more than is required. If the addenda are made 1 in., as indicated by dotted lines, the excess action is considerably increased, as is indicated by these figures. It is to be noted that the teeth in both pinion and rack clear the interference point by a good margin when the addendum of both is 0.8 in. When using this pressure angle of 24 deg. 4 min., the load on the bearing is 6 per cent more than when employing the 14½-deg. angle. This increase is little and may be considered negligible.

It appears from an investigation of this kind that a 24-deg. pressure angle with an 0.8-in. addendum may furnish a highly satisfactory interchangeable standard.

It is not believed that this matter can be easily and cheaply settled. Much experimental work should be carried on in a painstaking and unselfish fashion. Undoubtedly it would best be done in a place fitted up for research work, all experiments being made on the same devices, in the same way, and careful records kept of

results. In judging the all-around performance of gear teeth, the matters of noise, durability, strength and other lesser factors should influence our conclusions. If we as a society are really sincere in this task, we should make every effort to carry on the work to completion. Unquestionably the money cost of such work would be considerable, and this matter of finance must necessarily receive our attention.

This paper has dealt largely with an interchangeable standard. It is undoubtedly a matter of paramount importance. The special case arises, and recently has been much discussed. It is perhaps timely to direct attention to the fact that formulas assuring the very best pressure angle and tooth proportions for any specified pair or pairs of gears may be easily worked out. Possibly a secondary standard covering these special cases would be advisable, and prove to be part of the work. There is nothing mysterious about these special cases, and, further, they may all be handled by any of the commonly used processes of to-day, thus making the possibility of their production open to all.

## A New Spring Cover

OF late years spring covers have come into use mainly abroad, but also, to a certain extent, in this country. The object of these covers is to exclude dirt from the contacting surfaces of the spring leaves and maintain a film of lubricant between them. If no means are provided for maintaining this film, the leaves become dry and rusty, the flexibility of the spring changes and the spring is very apt to squeak.

A spring cover of very simple design, which is produced by the Ideal Garage, Inc., is shown by the accompanying illustrations. It is made in both leather and pantasote, the latter in two different weights. On the inside the cover is lined with a heavy felt which holds oil in absorption. The covers come in flat form ready to be wrapped around the springs, one cover for each end of a semi-elliptic spring. One side and one end of each cover are lap-seamed, while the other side and end are unseamed, thus making it easy to adapt the covers to odd size springs. These covers are held on the springs by coiled steel springs, the ends of which

Leather and Pantasote used in new spring cover

hook into holes in the leather, etc. It has been found quite unnecessary to rust-proof the small springs, as they are protected by a light oil film which constantly covers them. The covers are made in three widths and in a considerable number of lengths.

## Merchandising Accessories

INSTALLATION difficulties have often retarded accessories sales to a considerable extent. Accessory manufacturers in an effort to overcome this sales resistance have attempted to get car manufacturers to construct the original vehicle in such a way as to render installation easy. In some cases, the accessory manufacturer has gone further, however, and has offered to bear part of the manufacturing expense necessary to render less difficult the installation of the

How Moto-Meter installation is facilitated

particular device in marketing of which he is interested.

An interesting instance of this kind is the device recently adopted by the Boyce Moto-Meter Co. to render installation easier and to decrease sales resistance. This company has devised a rubber plug with metal top which fits into a ¾ in. hole in a radiator cap. The metal cap bears, in small letters, the words "Remove to install Boyce Moto-Meter."

The Boyce company has offered to supply these plugs free of charge to radiator cap manufacturers who will use them. The plug gives the radiator cap a pleasing appearance and the advertising feature is not visible except upon close examination. Installation of the Moto-Meter is rendered simple, however, since the plug can readily be removed by a slight pressure of the finger. The idea is interesting as a practical sales promotion method.

# High Speed Riveting Hammers in Automobile Production

Many operations accomplished in manufacture of various parts of cars with this tool. Delivers rapid succession of strokes without overheating, is claim. Simplicity and ease of handling make it possible for women operators to work with the hammers. Various operations are described.

**N**O other branch of industry has confronted machine tool designers and the engineering profession in general with so many difficult problems as the automotive industry. Automotive manufacturing has attained its present high standard only as a result of continued research and experiment looking toward improvement in the production of every part which enters into the complete product.

Many production engineers are said to look favorably upon the use of high speed riveting hammers for upsetting solid and hollow studs, rivets, pins, etc. These hammers deliver what is described as elastic vibrating strokes at high speed. The rapid succession of blows does not overheat the riveted stock, as has sometimes been feared they would; the rivets are not subjected to a slow, heavy pressure to fill the rivet hole, but, instead, the action of the high speed hammers causes the shoulders to hug tightly and the revolving peening action of the hammer first makes a wedge of the protruding stock and then quickly forms an oval or a round head, or fills a countersink to form a flush head.

The following notes on methods of application to familiar operations in the automotive industry and time studies in connection therewith may prove of interest. The operations described cover a very considerable

range of work, calling for the delicate strokes necessary for upsetting a 1/16-in. pin or rivet, to the heavy, powerful strokes necessary for heading a 1-in. case-hardened tractor chain pin.

Fig. 1 illustrates the upsetting of circuit breaker spools onto their bases in the plant of the Electric Auto-Lite Corporation. The studs are tightly upset in four seconds each. Tending of the machine is said to involve a low fatigue factor, which makes it possible for women operators to do the work. Another operation in the electrical equipment branch of the automotive industry is the riveting of tungsten contact points to the contact levers, etc., which is done at the rate of one point per second. A tight fit and a good finish are obtained in this operation, and no chipping needs to be done.

In riveting assemblies of automobile hardware (as used on closed car bodies), starters, safety signals, carburetors, etc., women operators are obtaining speeds of one rivet per second on sizes up to 3/16 in. diameter.

Fig. 2 represents the riveting of brackets which hold the lever and link of an internal brake assembly, the photo having been taken in the plant of the Raybestos Co. The length of the brake bands is 18 in. and they are 1/4 in. thick. Sixteen rivets are required per brake band to assemble the lever and link, and 300 rivets are

Fig. 1—Upsetting of circuit breaker spools onto their bases

Fig. 2—Riveting brackets that hold lever and link of an internal brake assembly

Fig. 3—Differential gear in the riveting hammer

Fig. 4—An operation on tractor gears

headed every hour. Brake lining is riveted with copper rivets and drawn up. For riveting up brake bands, the hammers are sometimes arranged in gangs. Thus, in the plant of the Timken-Detroit Axle Co., where four pieces are riveted to each band with fourteen 3/16-in. iron rivets, the work is done in a number of machines located side by side. First, a malleable brake support is secured to the middle of the band with six rivets; next two clips are secured in position, one on each end, with

three rivets apiece; finally a sheet metal punching is fastened in position with two rivets. A boy loads the rivets into the fittings and keeps two hammers going.

The riveting of automobile rebound clips is performed with a high speed riveting hammer at the plant of the Perfection Spring Co. The shanks of the clips are 3/8 in. in diameter, and though the work is comparatively heavy, production is at the rate of four springs per minute. Actual riveting time is only 8 seconds per spring.

Fig. 5—Securing driving flanges to rear axle shafts of three-quarter floating axle

Fig. 6—Upsetting chain link pins with the hammer

At the plant of the Chevrolet Motor Co. three bosses are riveted to each brake flange plate, which is a sheet metal stamping  $\frac{1}{8}$  in. thick. Two of the bosses are of cold-rolled steel of  $\frac{7}{8}$  in. diameter, while the third boss is square. A gang of three hammers is installed, each performing one operation, and in this way the excellent production of 300 bosses per hour is obtained.

In the manufacture of differential gears the New Process Gear Corp. uses high speed hammers for a number of operations. These differentials are of the spur pinion type and eight studs are used for holding the assembly together. First the side plates, pinions and studs are assembled loosely. The operator places the differential thus put together on a fixture, inserts a locking pin vertically through the central hole, and after the assembly is placed in position in the hammer, one stud is riveted. The operator then withdraws the locking pin, turns the differential case around and rivets a second stud opposite the first one. The riveting is continued until eight studs have been riveted on the top side. The work is then turned over and the opposite ends of the studs are riveted. While the riveted heads are being formed the operator constantly manipulates the gears to avoid binding. One man produces eight to ten completely assembled gear cases per hour. The assembled differential gear in the riveting hammer is shown in Fig. 3.

The R. D. Nuttall Co. secured an order for tractor gears which, according to specifications, were to be cold-riveted. To avoid heat stresses the engineers tried riveting by high-speed hammers. The gears to be assembled had outside diameters of  $8\frac{1}{2}$  and  $16\frac{1}{4}$  in., and six  $\frac{5}{8}$ -in. headless iron rods are set in place, both ends being headed over. These  $\frac{5}{8}$ -in. rods were headed at the rate of one every four seconds, and a very tight job was secured. (Fig. 4.)

In the so-called three-quarter floating axles the driving flanges are rigidly secured to the rear axle shafts.

At the works of the Reo Motor Car Co. a high-speed hammer was installed for this purpose and as a result the production was quadrupled as compared with the hand riveting formerly employed. The axle drive shaft is of high carbon steel  $1\frac{1}{4}$  in. in diameter. The shaft ends are cut with four splines and when the cap is in place there is  $\frac{3}{16}$ -in. stock to rivet. By means of the high-speed hammers these shaft ends were upset in one minute each, as illustrated in Fig. 5, whereas formerly when sledge hammers were used, it took exactly four minutes.

Riveting of nickel steel ball studs to steering knuckle arms is done with a high-speed hammer at the plant of the Saginaw Products Co., a branch of the General Motors Co. The ball has a  $\frac{5}{8}$ -in. shank and is forced into the arm by an arbor press. About  $\frac{1}{8}$ -in. stock is left to rivet and the hammer turns the head over to  $\frac{3}{4}$  in. diameter. During a five-hour test run a production of 2200 was attained. This job is of particular interest for the reason that the ball studs are made of comparatively hard material.

Upsetting chain pins is an operation for which high-speed hammers have been used for a long time. At the plant of the American High Speed Chain Co. the pins used for holding together the links of  $\frac{3}{4}$ -in. pitch 4-in. wide chains have ends  $\frac{9}{32}$  in. in diameter. These pins lead through washers over which the ends are headed. An average production of 600 per hour is attained on this size, and on other sizes in proportion. The operation is illustrated in Fig. 6.

Other parts of motor vehicles in the manufacture of which high-speed hammers are used to advantage are bow top frames, brake drum side covers, roller bearing cages, tire pump plungers, spare tire carriers, folding baggage carriers, lamps, bumpers, oil cup hinge pins, knurled heads on priming valve stems, shackle pins on shock absorbers and automobile jack assemblies.

The above article is based on information furnished us by the High Speed Hammer Co., Inc.

## A Fuel Pump Without Glands

**T**HE Sylphon fuel pump was designed to fill the need for a pump which requires no packing gland. It gives a maximum discharge pressure at high speeds and sufficient fuel at any speed, thus doing away with a relief valve. It is built in duplex form so that in case one pumping unit fails the other unit will maintain sufficient fuel supply for all engine needs.

According to the air service information circular nearly

Sylphon fuel pump for use on aircraft engines

two years in flight at McCook Field and a 1400-hour bench test at full capacity have revealed no failures of any kind.

A four-pitch worm meshes with a 32-tooth worm wheel which drives the cams. These in turn operate the cam followers attached to the Sylphon. As the worm rotates the worm wheel on the camshaft moves the plungers down only, admitting fuel from the main tank to the Sylphon, which is returned to its original position by the spring designed to give a maximum pressure of  $4\frac{1}{2}$  lb. per sq. in. with a closed discharge.

**A** HARDENED steel ring gage 1 in. long was ground and lapped out at the National Physical Laboratory in England until the internal diameter was 1.0000 in. The outside diameter, which was 2 in., was ground true. A plug gage was ground and lapped down until it could be inserted into the ring, using ordinary hand pressure, and with both the gages clean and free from any trace of grease. The size of this plug was found on measurement to be 1.0000 in. A second plug was then made whose diameter was 1.0002 in. This plug refused to enter the ring so long as the surfaces were kept dry and free from grease, but when lubricated with vaseline it was found possible to assemble the two gages by ordinary hand pressure. By measuring over its outside diameter both before and after the plug had been inserted, it was definitely proved that the ring had been stretched in the process of inserting the gage.

# Export Figures Reach High Mark in October

Foreign sales continue to increase in value despite material lowering of prices. New orders make up the shipments instead of old business as was the case a year ago. Spanish and Portuguese countries take 30 to 50 per cent of the total amount exported. An indication of future business.

By George E. Quisenberry \*

THE detailed export figures for the month of October, which have just become available from the Bureau of Foreign and Domestic Commerce, are worthy of careful study by all branches of the automotive industries. They reveal, in the shipments of passenger cars, trucks, parts and tires to all parts of the world, numerous tendencies that should claim the interest and close attention of those executives and export managers who are seeking to build up additional markets and further sales for the products now coming out of American factories.

Several explanatory factors must be kept in mind in any consideration of the foreign business in October. The most important, of course, is that the curve of export sales, according to value, continued through that month the sharp upward trend shown since the low point was reached in July—this despite the fact that prices have been lowered materially in the intervening months. It is necessary to go back to the first part of this year, when old orders were being filled, to find shipments appreciably higher, either in dollars or physical volume, than they were in October.

## Shipments Are New Orders

Furthermore, sales in that month consisted entirely of new orders. If we could have a curve representing current orders as received by all the producing factories of this country, undoubtedly we would be forced to return to the latter half of 1920 to find a similarly high position. The heavy shipments shown in November, December, January, February, March and perhaps later can be attributed not to new business but to shipments made on old accounts and postponed while domestic demand continued high. But the early months of 1921 saw the completion of all these old contracts, and since the late spring or early summer our foreign sales have been in response to new demands from the automotive centers of the world. That the total was so high in October is ample testimony that our foreign trade is again in the ascendancy. This condition is amply borne out by the statements of different exporters who are frank in admitting that present inquiries, orders and shipments are steadily increasing.

The October figures also must be read with an understanding of the Ford distribution system. The statement has been made previously, but it is worthy of repetition, that all American exporters should keep themselves closely posted on all the activities of this pioneer of foreign trade. Thus the October shipments show that Ford is continuing the shipment of parts to Argentina

in keeping with the reopened business in that southern country. Ford sales revived in Argentina in September and, as a consequence, the shipment of parts to that republic increased 1000 per cent (from \$47,000 to \$479,000) between August and September. The demand continued into October and at a high level, which, according to a recent Ford statement, means the difference between 2150 cars and trucks in September and 1650 in October.

The Ford plant in Brazil increased its output in October and the parts shipments to that country went up from \$14,000 in September to \$95,312 in October. Ford maintains an assembly branch in Denmark and the parts shipped to that country more than tripled the September total. As Spain is the location of another Ford plant, we see a similar enlargement of shipments, the increase having been nearly five-fold. France more than doubled the purchase of parts, and only England and Japan, in each of which assembly branches are located, showed declining purchases in the latter month, although the output still remained at a high level.

The figures for the various countries speak for themselves and any study of them will reveal emphatically that world automotive development again is going for-

ward. The following compilation, however, made up from the October totals of cars, trucks, parts and tires, will show the relative standing of the leading automotive purchasers.

Canada .....	\$1,226,397	Cuba .....	\$262,381
England .....	956,627	India .....	248,263
Mexico .....	561,105	France .....	203,846
Argentina .....	506,082	Japan .....	149,298
Denmark .....	408,968	Dutch East Indies....	145,944
Brazil .....	392,754	Netherlands .....	129,384
Australia .....	298,211	Spain .....	127,603

The total value of the October foreign trade on cars, trucks and parts was \$5,410,739,\* with an additional \$1,447,268 on tires. No month of the entire year, except January, has shown a larger value of tire shipments than October. June, July, August and September were each exceeded by the value of the car, truck and parts shipments.

Analyzing the figures somewhat further, the detailed information in the accompanying table shows that the Spanish and Portuguese-speaking countries contributed much in running up the surprisingly high totals. In each of the major products these Spanish and Portuguese countries were responsible for from 30 per cent to more than 50 per cent of the total, the comparisons being:

	Cars		Trucks		Parts	Tires
	No.	Value	No.	Value	Value	Value
Spanish-Portuguese†	822	\$638,435	294	\$413,765	\$700,600	\$461,995
World total.....	2,229	1,952,641	595	755,096	2,703,002	1,447,268

To complete the study of the October figures it is necessary to consider also the financial and economic aspects of the various countries. An analysis of past business is of no value unless it points the way to the future or reveals something of present value. The October business is past, but what does it show for to-day and to-morrow?

The international political, economic and financial situation is vastly different to-day than it was in September and October, when orders for the latter month's shipments were placed. The Irish problem, fraught as it was with such grave dangers for the peace of England, Europe and the world, has been settled, or is in an immediate way to be settled. The Washington conference is

arriving at an international understanding that will be of lasting benefit to every country. France and England are reported near an accord on European problems, and Germany, according to the latest newspaper reports, will pay the next indemnity installments due early in 1922 and then will be accorded a three-year moratorium, with stoppage of the printing presses and a consequent stabilization of her finance. None of these things and many others had come about, or were in immediate prospect, to show the foreign buyer in September and October that more settled conditions were in the offing. To-day they are signposts along the road to international stability and a return of world-wide prosperity.

What has been the result? At the beginning of October the British pound sterling was quoted in the United States at, roughly, \$3.73, with automotive exporters declaring that should it reach \$4 (less than 20 per cent below par) they would be assured good business to all of the English dominions. As this article is written, in the second week of December, the pound has climbed upward to \$4.08,\* and some financial publications are talking about its further increase to \$4.25. French exchange is pointing upward, and the currency of Spain has progressed so much since October that now it stands at a record height for the year. All of the other neutral countries of Europe are appreciably higher in the foreign exchange markets, and Germany has passed "Black Thursday," with all that it may mean to international finance. Some South American currencies are quoted higher or have reached a certain stability that will enable her importers and dealers to gage their future business and handle it with less fear of violent fluctuations. The same is true of the Far East, and this betterment, in all except a few countries of the world, is borne out by the weekly and monthly cable and mail reports of trade associations, banks and governmental agencies.

Export managers and executives are determining now their sales and production policies for the coming year. Upon the analysis made of the present evidence must depend their decisions and none of the factors shown here should be overlooked.

\*Hawaii, Alaska and Porto Rico not included.

†Porto Rico not included.

\*Sterling exchange touched \$4.24 on Dec. 12, standing then just 12 per cent below par.

## Cracking Increases Gasoline Production

IN a recent issue of the *Wall Street Journal* it was said that in the first eight months of 1921 gasoline produced in American refineries represented in quantity 28 per cent of the crude oil run to stills, compared with only 13 per cent in 1915. The percentage has increased gradually each year, but has been accompanied also by a decrease in volatility.

Gasoline became the chief product of crude oil in 1915 in value. In 1918 the value of gasoline produced equalled that of all other products combined. Its value totalled \$684,000,000. Since 1918 it has become an increasingly important factor, until now the gasoline market goes a great way toward determining the status of the oil industry as a whole.

During the early part of 1921 the oil industry suffered a decided slump. Consumption of oil products here, with the exception of gasoline, was unusually low. Exports of all products, including gasoline, fell off considerably, but gasoline consumption in the United States continued active. This fact has played a large part in the current recovery in the oil industry.

The steady increase in consumption of gasoline in this country is in line with the gain in number of automobiles in use. It is estimated that 90 per cent of the cars in use are in the United States.

Domestic production of gasoline has increased four-fold during the last six years. Consumption has increased to a corresponding degree. The following table shows in barrels the production in the United States, domestic consumption, exports and percentage of gasoline to crude run through refineries by year since 1915 (giving first eight months of this year):

	Production	Domestic consumption	Exports	Gasoline produced to bbls. crude run in U. S.
1st 8 mos., 1921..	81,542,000	70,269,000	8,766,000	28%
Year 1920.....	116,251,000	101,343,000	15,633,000	27%
" 1919.....	94,235,000	81,781,000	9,098,000	26%
" 1918.....	85,007,000	74,512,000	12,538,000	25%
" 1917.....	46,719,000	34,783,000	9,902,000	21%
" 1916.....	49,021,000	27,087,000	8,473,000	19%
" 1915.....	31,755,000	26,077,000	6,943,000	13%

# The Sales Promotion Movement of the A. E. A.

Some of the methods adopted in the campaign to increase sales of equipment might apply to other branches of the automotive industry. "Ask 'Em to Buy," is the slogan of the movement which includes educating all the salesmen in the business. Success will mean increased factory output.

By Neal G. Adair\*

THE automotive industry has been made the laboratory for an experiment in merchandising which is going to attract constantly widening attention as it progresses. It is the sales promotion movement of the Automotive Equipment Association, which is only half a year old, but which already has made its influence felt in half the American states and several Canadian provinces.

The movement is unusual in that it is a joint undertaking by manufacturers and wholesale distributors of a group of products. The object, of course, is to build the businesses of both manufacturers and wholesalers by broadening the market for these products, a process which brings into the plan the thousands of retail agencies which furnish the industry's points of contact with the consuming public—automobile and truck dealers, garagemen, repairmen and equipment dealers.

Necessarily the basis of the plan is education. Obviously the focal point for the application of the educational process is the point of contact with the consumer. If the retailer is a better merchant he will sell more goods to the consumer and the wholesaler and manufacturer will benefit along with the retailer. But the sales promotion organization has not made the mistake of trying to "uplift" the retailer. It has studiously avoided any implication that it was going to do something to him. More than that, the sales promotion leaders have put the manufacturing and wholesaling elements of the industry on record as confessing that they need merchandising education as well as the retailer. Confession is not only good for the soul, but it makes friends for the confessor, and the A. E. A. has got away to a flying start in its newest and greatest work because it has made the retailer a partner in, rather than a mere object of, the better merchandising campaign.

## Campaign Working on Salesmen

Manufacturers' salesmen doing missionary work in the wholesale and retail field, jobber salesmen and retailers and their salesmen are primarily the subjects upon which the campaign is working, but even the manufacturer and the jobber have been included as needing education—and they are getting it.

This article will attempt to tell something about the methods by which the sales promotion campaign is being worked out. It will suggest some possible applications of the sales promotion idea to the automotive industry in general.

\*Editor *Motor World*.

The sales promotion organization has hit upon two things which have attracted attention to its work, humanized it and popularized it. One is a slogan; "Ask 'Em to Buy" is the campaign watchword. The other is a string of numerals after a dollar sign, which he who runs always reads and wonders how many he can corral for his own pocketbook; \$250,000,000 is set up as a year's business for the industry to aim at.

## A Gratifying Response

There is more than a slogan in "Ask 'Em to Buy." The manufacturer and jobber have spent years urging retailers to sell. The retailer has sold some, mainly what customers asked him to sell and sometimes a little more, but largely he has been answering injunctions to sell by inquiring how. The answer is "Ask 'Em to Buy," and there has been a gratifying and somewhat surprising response to this information by dealers and garagemen who have been selling cars, repairing cars and garaging cars and, through force of habit, stopping there while automotive equipment collected dust on their shelves until people asked them for it. The slogan by no means is all there is to the campaign, but it furnishes something to talk about and center interest in, and a practical yet human motion picture has been built around the phrase as one of the chief tools for doing the work of the campaign.

As for the figures, they represent sales of \$25 worth of automotive equipment per year to each of the 10,000,000 cars in the United States and Canada—a potential market of \$250,000,000 for the campaign and the industry to aim at. This is just a rough estimate, but it is something definite to talk about.

The campaign organization and methods are simple. We have become so used to finding a ponderous "secretariat" connected with almost everything in the way of organization that it is refreshing to discover that the staff which has undertaken extension of sales promotion in the equipment field all over the United States and Canada has only four members. There is the merchandising director, Ray W. Sherman, an assistant and two secretaries. They constitute the entire paid organization. In general supervision is a committee of five members of the association, serving without pay.

This leads to the question—Who is doing the work? The answer is as refreshing as the discovery of the smallness of the staff. The industry is doing the work. There are to be in this undertaking no hundreds of thousands of dollars spent on field workers and propaganda. The automotive equipment industry is organizing itself to do its own work of broadening the outlet for

its products and increasing the profits made from them. The ultimate goal is to make every manufacturer and jobber sales executive a promoter, through his executive position, of the educational work of the campaign, and to make every manufacturer's and jobber's salesman an active educator, carrying to retailers the story of the campaign with its admonition to "Ask 'Em to Buy" and its information as how this can be done.

The association could have spent upward of \$100,000, perhaps more, on an army of field men who might have been able to reach each of the retailers once within a year with the sales promotion story. The story would have been told once and by a man whom the retailer did not know nor trust. Instead it is training the jobber salesmen and those of the manufacturer who come in contact with retailers to deliver the message. They will deliver it many times within a year and the delivery will be made by men known and trusted by the retail trade.

### Relaying the Message

The merchandising director is touring the country, presenting the sales promotion message in person as rapidly as possible to territorial groups of jobber salesmen and manufacturer salesmen whenever the latter are available. Jobbers and their sales managers who have heard the story are using the prepared address of the department to present the story in territories which the merchandising director has been unable to reach. The jobber salesmen, in turn, are carrying the message in person to their customers. In addition, there is a supplemental work in the appearance of the merchandising director, jobbers and salesmen before dealer meetings. The organization of state vice-presidents of the A. E. A. is handling the details of the work, territory by territory, arranging meetings of jobber and dealer groups. And always reinforcing the spoken word is the "Ask 'Em to Buy" film, which has been duplicated several times and which will go the rounds of the various distribution territories until the entire trade has watched it unfold the story of the jobber salesman who showed a garageman the profit opportunities in automotive equipment merchandising and demonstrated how they could be turned into money in the cash drawer.

The campaign is presenting to the trade practical, concrete information about successful methods of advertising, displaying, demonstrating and selling automotive equipment. Details are not necessary here.

The enthusiasm with which the A. E. A. membership, manufacturers and jobbers, recommitted itself at the November meeting to the sales promotion movement inaugurated in mid-summer promises country-wide co-operation of a nature that gives the headquarters staff, small as it is, a little more than an even chance of accomplishing its task.

### Will Aid the Industry

The enthusiasm of the membership is not difficult to understand. There is nothing philanthropic about the campaign. It won't hurt the motoring public, which is being asked to buy only tried and proved equipment which will improve the operation of its cars. It will help manufacturers, jobbers, retailers and their employees, which is fundamentally the only reason for the campaign, a selfish reason and, when all is said and done, the only kind of reason that will hold men and corporations together in any sustained co-operative effort.

The campaign is not wholly without propaganda, or something that approaches it. For the manufacturer and jobber, members of the A. E. A., there is a merchandising department in *The Leader*, bi-weekly organ of the

association. For the manufacturers' and jobbers' salesmen there is a bi-weekly merchandising organ, *The Automotive Equipment Merchandiser*. For the retailer there is an illustrated book of 32 pages on automotive equipment merchandising. These publications go only to people who will use them. A. E. A. members naturally follow *The Leader* issue by issue. Their salesmen get *The Merchandiser* regularly through their sales managers. Dealers receive the merchandising book only after they have become sufficiently interested in the campaign to ask a jobber salesman for a copy, and then they have to pay 15 cents for it. In addition there is the "canned" address for meetings, which headquarters sends out to jobbers or their salesmen who ask for it to use in their territories.

Briefly, this is the story of the sales promotion movement, which has drawn some observers from outside the industry. It is a plan particularly applicable to an industry comprising many products of many manufacturers marketed through wholesale distributors and retailers, who, in turn, handle a diversity of products, some represented in the association, some from outside. There is none of the exclusive element which prevails in the distribution of automobiles. But there are features of the campaign which deserve the study of the automobile industry.

### Adaptability of the Plan

Chief among these is the education of traveling salesmen. The automobile field employs this class of workers: territorial men for manufacturers and branch houses or distributors. Dealers generally concede that these men, particularly the factory travelers, are working along more intelligent lines than they were a few years ago. Not so many of them breeze into distributor's or dealer's office as formerly with two questions on their tongues: "How many cars are you going to take this month?" and "Where is the party to-night?" But not enough of them yet are capable of helping distributors, dealers and their sales staffs broaden their knowledge of the car they represent and the means of selling it. Not enough of them can answer a dealer's questions nor prompt him to ask questions about the reasons for the latest changes in the design of the car. Not enough of them can go down the street with the dealer and help him convince his banker of the essentiality and stability of the automobile business and his business. Not enough of them have the understanding to grasp the fundamentals of their dealers' problems and take back to the factory a story of those problems that would assist the factory in appreciating the dealer's situation and helping to make it more bearable.

The passenger car industry needs merchandising education in manufacturing and dealer establishments. It needs more origination of merchandising ideas in factory sales organizations. It needs men, possibly a re-educated set of travelers, possibly an entirely new class of men, to take these ideas to the wholesale and retail field.

Perhaps the passenger car industry can see in this work of the Automotive Equipment Association, which is trying to educate the retailer by first educating the sales representatives of the manufacturer and wholesaler, an idea which can be adapted to its own predicament. It may be an association job or possibly a job for individual manufacturers or groups of manufacturers under kindred ownership or control.

The Automotive Equipment Association is applying sales promotion not merely to equipment, commonly called accessories, but to re-equipment or replacement products and to shop equipment and tools. The entire process is educational. It is worth watching.

# Marketing Costs Determined by Many Factors

An analysis of these factors, together with a close study of methods of elimination of observable waste will enable the business man to concentrate his efforts along a higher plane of efficiency. A definition of the major terms and variations covered by the single term of merchandising.

By Harry Tipper

**I**N the study of marketing fundamentals it is necessary to arrive at a definition of what is meant by marketing, and also what are to be observed as factors of its cost, with a definition of their meaning, so that some basis of calculation may be established.

Marketing, distributing, merchandising, selling, advertising and similar terms have acquired a more or less indefinite meaning, so that some of the factors are similar in all examinations, but the practice of definition varies to such a degree that it is impossible to lay costs side by side under any one of these headings and make a comparison which will be effective.

Items that are to be included in advertising depend upon the practice of the individual concern, and a similar condition prevails in selling.

The term merchandising, as also the term sales promotion, covers a multitude of variations in the practice and the considerations of cost.

The student of marketing who endeavors to discover the avoidable wastes and compare their cost with the total cost, finds himself hampered by the lack of any practical standards and definitions which would give him a basis of final consideration.

It is possible to indicate some of the elements of analysis that should be a part of the examination of the marketing developments, and these, together with the definitions of the major terms, provide a basis for reconsideration of the marketing which will enable the business man to eliminate some of the more observable wastes and concentrate his efforts along a higher plane of efficiency. In these articles the definitions of the terms will be as follows:

- 1—*Marketing*. The word *marketing* will be used to designate the actions necessary to transfer the goods from the factory door to the user.
- 2—*Distribution*. The word *distribution* will be used to indicate the physical requirements of transportation, storage, handling, etc., connected with the physical transfer of the goods.
- 3—*Selling*. This term will be used to designate all those operations necessary to the transaction of securing an order by the personal contact of the salesman and buyer.
- 4—*Advertising*. This term will be used to denote those operations necessary to effective selling conducted with buyer of product by means of paper and ink.

- 5—*Sales Research*.—This term will be used to denote those operations devoted to the more accurate analysis of markets, the consideration of new markets and the coördination of the product with the market; in other words, the accumulation of accurate information as to sales necessities.

Sales promotion will be dispensed with altogether. This term relates either to advertising, selling or to sales research, and does not describe a function in marketing at all.

In effect, the marketing necessities are divided into the following groups which accord with the definition of the term:

- 1—The goods must be actually transferred from the point of manufacture to the point of use, and this transfer represents the physical distribution.
- 2—The buyer of goods must be convinced of their usefulness and their application to his work. Part of this work is done by the individual method of personal selling, corresponding to the work of the individual handworker who makes the product.
- 3—Part of this work is done by the advertising, which makes no attempt to individualize the operation, but rather takes advantage of the economy of mass work, in order to lessen the amount of work to be done by the individual units. Selling is an individual matter; advertising is a mass operation and is really selling in the mass.
- 4—Sales Research represents the laboratory, where the value of the operations, the objective of the operations, the efficiency of the operations may be determined in their possibilities.

All these groups of operations function in a complementary manner.

The work of distributing and marketing the goods consists of a number of related individual operations. With the exception of the physical distribution, the actual operations themselves are concerned with more or less intangible developments, so that their values remain controversial and subject to many variables.

The whole business of selling and advertising is concerned with the intangible necessity of persuading the buyer to direct his buying to the particular product. A good many operations are necessary to complete this work, and the number of elements included in the work makes

---

**M**ARKETING costs are not hypothetical. The graveyard of business is filled with the buried remains of those organizations who have been misled by improper sales research, careless of their sales and advertising efficiency and apparently without knowledge of the factors that make up their total cost and how they can be governed.

---

it difficult to measure the exact value of each of the subordinate operations in their influence upon the total sale.

What is the value of a salesman's call in the total array of operations he must go through in order to make a sale which the company can accept?

How far is a salesman justified in calling upon all possible users or customers without respect to their buying power and consequently their ability to purchase?

What is the minimum limitation upon the number of calls a salesman should make, as well as the maximum?

These matters all depend upon psychological averages in the final analysis, and therefore the practice of estimating them has come mostly out of traditional development and not out of the attempt to discover their relative importance.

The same thing is true in advertising:

What is the value of reaching a subscriber to a publication?

What influence is exerted upon him by the character of the message?

What are the limitations of reading attention and how do they affect the value of the advertising or its efficiency?

Why do people observe only one or two things out of a thousand that pass the vision?

How do we know in what category our advertising is to be placed?

To what extent does a visible indication of interest by inquiry or other form represent the actual effect of a piece of advertising copy?

These matters again are dependent upon human reactions, and consequently they have been assumed largely because of tradition. Little attempt has been made to determine and analyze scientifically the character of the average reaction and how we may expect to meet it. One promotion letter has been known to exceed in value another promotion letter by 1000 per cent.

What were the factors that made up this difference in efficiency and how many of them could be controlled by the writers of the letters?

These are all elements of marketing cost. Every call that is made, usually by a salesman, must be paid for. Every effort of his work that is not properly directed adds to the cost of his actual production. Every element of the office system, supporting and coordinating the sales work, that is not valuable is inefficient and must be eliminated sooner or later. Every piece of promotion matter sent through the mail that finds its way into the waste basket of the recipient adds to the total cost of effectiveness in that department. Every advertisement issued in a publication which does not interest the right people at the right time adds its cost to the sum total. Each research into marketing that is based upon insufficient statistics or improper examination of the factors not only adds its own experimental cost to the result, but may

lead the sales and advertising work into unproductive and costly channels of experiment.

It is not as though these items of cost were hypothetical. The graveyard of business is filled with the buried remains of those organizations who have been misled by improper sales research, careless of their sales and advertising efficiency and apparently without knowledge of the factors that make up their total cost and how they can be governed.

Tradition has operated to produce more methods of sales organization and more methods of advertising and sales research expenditure than all the analyses of marketing put together. What the competitor is doing and what the trade has done in the past remain the first and most important questions when a new sales problem is confronted and organization budgets or changes are considered.

This is not analysis. No engineering development would have taken place on that basis alone. The past history and the competitive history is of importance only as it provides a basis for analytical consideration and improvement.

This basis cannot be secured entirely from these sources. Further research, further careful consideration of the individual factors and a careful arrangement of their cost consideration is necessary.

Even after this is done, however, the value of these motions depends very largely upon a knowledge of the principles which govern the action of the buyer and the particular reasons for the direction of his buying activity.

Furthermore, the analyst must beware of assumptions that have been accepted merely because they have become the usual practice.

Not so very long ago a friend of mine, in describing his experiences over a period of years in the deserts, referred to the fact that he had ridden about 7000 miles on camels at various times. One of his hearers asked him if he was not very sick at first, although he supposed that he got used to it. The explorer replied that the ordinary camel had a very easy motion. He did not know how the impression of sickness had arisen, except that Herodotus had spoken of it and that probably every authority since then had copied Herodotus' statement.

There are many assumptions in marketing having as little basis of fact as the effect of camel riding in this story. Those assumptions are accepted just as readily—in fact, quoted just as firmly.

So long as these traditions are included and much of the so-called analysis of the market accepted without question, marketing efficiency will increase very little and the cost of marketing will continue to increase.

In order to determine the factors of marketing cost, it is necessary that the principles of marketing be thoroughly understood. These can be discussed upon the definitions considered in this article, and further articles will enlarge upon these principles.

## Eliminating Waste in Industry

**A** REPORT of the Committee on the Elimination of Waste in Industry of the Federated American Engineering Societies has been embodied in a book that has recently been published. This book contains a complete statement as to the aims and purposes of the committee and a description of the way in which it went about conducting the investigation.

Secretary Hoover of the Department of Commerce, in his foreword to the book, that "it contains a message for government officials, financial, industrial and commercial

leaders, labor organizations, economists, engineers and research groups, the general public and the press."

In a general review of conditions the report places a high percentage of waste at the door of management and declares that the average management is much below the standards set by certain individual executives who have achieved notable success. The labor problem is also entered into thoroughly.

The book, which is entitled "Waste in Industry," is published by the McGraw-Hill Book Company, New York.

Automotive Industries—The Automobile is a consolidation of The Automobile (monthly) and the Motor Review (weekly), May, 1902, Dealer and Repairman (monthly), October, 1903, and the Automobile Magazine (monthly) July, 1907.

## Export Cooperation

ONE of the most significant announcements that has come before the automotive industry in recent months is that the export managers of the National Automobile Chamber of Commerce will consider, at their annual New York meeting in January, a plan for combined merchandising and sales efforts to develop our foreign trade in passenger cars and motor trucks. The fact that such a plan is even in prospect should stir the industry to a careful study of the possibilities and opportunities for enlarging, through combinations of the producing companies, the sales abroad of American-made automotive products.

The foreign trade department of the N. A. C. C., unfortunately, has not seen fit to make public the details of the proposed movement so that it might be analyzed by company executives and export managers in advance of its consideration at the annual meeting. However, it is apparent that the plan involves a grouping of various companies, under the Webb-Pomerene law, for cooperative effort in building up sales outside of the continental limits of the

United States. Several forms of combinations are possible under this law and whichever one is chosen would seem to insure, at least to a majority of the companies, stronger and more intelligent foreign trade representation than they have formerly had.

The Webb-Pomerene law has been on the statute books for some years and its provisions, which permit competing companies to band together for common activities in fostering foreign trade, are fairly well known to every exporter. Numerous combinations of this sort have been organized and, according to reports, have functioned very satisfactorily to their members. Mainly, they have consisted of companies producing raw materials, such, for instance, as coal, grain, etc., but some have been for the sale of semi-manufactured or manufactured articles that are analogous to automobiles. These have been of factories producing steel and iron products, railway locomotives, textile machinery and other highly competitive lines and these combinations have been so successful as to make probable a similar success in the automotive field.

## Developing Commercial Aviation

THE prospects are growing brighter for the establishment of a government Bureau of Aeronautics as provided for in the Wadsworth-Hicks bill now before Congress. President Harding in a recent note to Congress says, "I urge upon the Congress the advisability of giving heed to the recommendations of the Committee, the first and most important of which is that a bureau be established in the Department of Commerce for the regulation and development of air navigation."

This note of the President's referred to the general recommendations of the National Advisory Committee for Aeronautics which recommended a Bureau of Air Navigation similar to that proposed in the Wadsworth-Hicks bill.

The development of commercial aviation in the United States has been disappointingly small. The passage of this bill would mean a definite step in promoting its further growth and advancement. It is encouraging to have this definite favorable opinion from the chief executive.

## Unit Production Costs

HARD times, with the accompanying evil of unemployment, place the employer in an advantageous position as regards dealing with his workers, when industrial relations are viewed as a matter of balance of power. In another sense, however, the employer is in a less advantageous position.

Business depression brings with it the necessity for reduced manufacturing expenses, lower prices, and, consequently, for decreased production costs per unit. The attitude of the individual worker toward his work is an important factor in bringing about lower cost per unit. Overhead expense, cost of materials, etc., affect that unit cost materially, of course, but the individual worker has it within his power to influence it considerably.

Thus the manufacturer who looked ahead during boom times, who sincerely attempted to adjust his industrial relationships fairly and intelligently has been able to cash in on those efforts during the recent business depression when he was most in need of the effective co-operation of every man working for him. A certain amount of increased efficiency has accrued to every manufacturer through fear of unemployment, but employers such as those referred to have benefited more fully. They have gained, not only the general increased efficiency, but have preserved the good-will and enthusiastic co-operation of their workers through a difficult period of necessary wage reductions. All this is a distinct manufacturing advantage at the present time and, in addition, is a sound basis upon which to rebuild an organization as business picks up.

## Taxes and Industry

**F**URTHER revision of internal revenue laws, as suggested by President Harding in his message to Congress, warrants thorough study by the automobile industry. One of the chief stumbling blocks to the extension of the industry is the excessive taxation to which it is subjected under Federal, State and municipal laws. The principal objection is against the excise tax, which has been aptly styled a "stigma" tax. A determined effort will be made to bring about an equitable adjustment during this session. However, there are other taxes which are burdens to the trade. The new tax law, which becomes effective Jan. 1, 1922, carries an increase in the flat tax on net corporate income, making the rate 12½ per cent. At a glance this rate appears reasonable, but the attitude changes when it is considered that there is a capital-stock tax which amounts to approximately 2 per cent of the net income. The Secretary of the Treasury is not pleased with this form of assessment which he believes to be detrimental to persons engaged in productive business.

Practically every organization in the automobile trade is carried on under a corporate form and the net income in most cases is distributed in dividends. These dividends are subject to a surtax in the hands of persons receiving them. The owner of stock in an automotive corporation subject to a surtax of 10 per cent would in reality pay about 25 per cent to the Government. The flat tax on net corporate income and the capital-stock tax amounts to at least 15 per cent, and in addition there is the 10 per cent as a surtax on dividends. Larger stockholders subject to a 50 per cent tax would be taxed about 65 per cent on such profits.

## Larger Diecastings

**A** PROGRESSIVE manufacturer of diecastings recently informed us that he expects, within a comparatively short time, to make diecast gearboxes for passenger cars. He is already making gearboxes for washing machines, castings which weigh about 11 lb. each, and considers it but a short step to make a slightly larger box, suitable at least for the smaller passenger car.

Inasmuch as most diecastings require little or no machining—that is, are practically finished when they come from the die—a possibility of this kind should not be overlooked by those manufacturers who are interested in quantity production at minimum cost.

The diecasting industry has not stood still, content with confining itself to the manufacture of small parts and fittings, but has been developing its processes until to-day it is producing thousands of parts, considered almost beyond the bounds of possibility in the diecasting field but a few years ago. There are still, of course, certain limitations, but many of these are being overcome by the use of improved diecasting machines, better alloys, more durable die material and the intelligent use of metallurgical and other research facilities. The possibilities of future development seem to be still greater than they were thought to be a few years ago.

## The Underpan

**T**HE majority of cars other than the Ford have an underpan beneath the engine and gearbox, the object of which is to protect the lower parts of these mechanisms from splashing mud. It accomplishes this object quite well, but it has so many disadvantages that it is a serious question as to whether or not it is worth while to thus protect the parts mentioned. What difference does it make, after all, whether mud cakes on the bottom of the crankcase or on the bottom of the mudpan? European engineers seem to have reached the conclusion that the disadvantages of the device overbalance its advantages and have begun to discard it.

Perhaps the greatest objection to the underpan is that it gets exceedingly dirty, even more on the upper than on the lower side. It is practically impossible to make the crankcase absolutely oil-tight, and any oil that leaks out through the bearings or joints drops into the underpan and there soon collects enough road dust to make a sticky mass which covers the whole inside bottom of the pan. If any oil is spilled in replenishing the crankcase supply it also runs into the underpan. The pan, moreover, renders the crankcase draining plug cap or cover plate less accessible and adds to the difficulty of an already irksome job. In many cases the pan lies so close to the oil pump of the crank chamber that in case any small parts, such as nuts, studs, etc., drop into it, it is almost impossible to get them out again. A greater space between the two parts is not permissible as it would inordinately reduce road clearance.

It is, of course, most desirable to protect the accessories located at the sides of the engine against splashing mud, flying stones, etc., and this can be readily accomplished by the use of either integrally cast webs between front and rear supporting arms or by filler plates of aluminum or steel sheet which fasten to the flanges of the frame side members and of the engine at the parting line of the crankcase. Such a construction makes a much neater job than that usually obtained with the underpan, and eliminates the pit into which small articles almost invariably drop when it is attempted to remove them.

## Manufacturers Look to January Trade

Are on Solid Foundation Ready  
to Meet Keen Competition  
in 1922

Production of passenger automobiles and trucks in the United States for October by companies representing more than 90 per cent of the output of the industry was approximately 150,000.

The estimated total production of cars and trucks for November was 118,000.

NEW YORK, Dec. 13.—Motor vehicle manufacturers have adopted a conservative attitude, pending developments after the turn of the year, and the output for December will be the lowest of any month since the tide turned at the end of February. This is the usual seasonal condition, however, and not in any sense surprising. Inventories Reduced

All manufacturers are preparing, however, for an upturn with the New York show the second week of January. They have gone into the market for the purchase of parts and supplies on a moderate scale so they will be prepared to meet the demands of their trade. As the year nears its end it is gratifying to note the very substantial reductions which have been made in inventories, especially by makers of passenger cars. Nearly all of them have taken their losses and are in position to go ahead on a solid foundation in an era of exceedingly keen competition.

### Important Announcements Expected

The slowing up in production this year has been delayed much longer than was generally expected, especially in view of the unusually large number of important announcements which are expected at the big shows. It is probable the number of new models which will be displayed for the first time at the New York exposition will establish a new record. They also will embody greater value for the money and will evidence a determination on the part of engineers to keep down maintenance costs in the way of fuel and servicing.

Reports of combinations, especially in the parts and truck fields, are becoming more definite, and announcements are expected in the near future. It is probable the next few months will bring important changes in the automotive map. One of the

## FORD PLANS PURCHASE OF PLANT IN GERMANY

DETROIT, Dec. 12.—A factory in Germany, for the manufacture of automobiles for German, Russian and other western European fields, is being planned by the Ford Motor Co. Charles E. Sorensen, a member of the Ford organization, left for Germany a fortnight ago. At present he is in London, following a visit to the Ford plant at Cork, Ireland. He will start for Germany within a few days, according to information here.

The present plan provides for the purchase of a large plant in Germany and conversion of it into a Ford factory. Announcement as to the size of the plant and output and number of employees is withheld at this time.

most important of these impending announcements relates to a plan under which some of the most important unit parts makers will group themselves together for the establishment of service stations and substations at strategic points. A second combination of this character is under way.

Predictions that November shipments would exceed those of the same month last year proved correct, and they ran over the mark by approximately 10 per cent. Another gratifying point was that they fell off less than last year in comparison with October.

Production in January probably will be expanded by new and reorganized companies which will be getting under way by that time on something of a quantity basis. Among the newcomers in the field, Durant expects to be turning out at least 200 cars a day by January 1.

## Willys-Overland Ships Two Trainloads of Cars

TOLEDO, Dec. 10.—Two trains left here yesterday for Atlantic and Pacific coasts each carrying Overlands and Willys-Knight cars to dealers. The value of the shipments was placed at \$1,275,000.

The shipment to the East sets the record for automobile shipments for the year. It is the largest trainload of automobiles hauled in 1921. The train consists of 100 cars and in them are 615 motor cars for New York, Boston and Philadelphia. The value of this load was \$875,000 and freight charges alone amounted to \$58,000.

The Western shipment contained 80 cars carrying 281 Overlands and 109 Willys-Knights valued at \$400,000.

## See Administration Support of Sales Tax

Attitude Taken by Mellon May  
Mean Broad Extension of  
Excise Levy

WASHINGTON, Dec. 12.—Indications that the Administration is preparing to swing its support to a manufacturer's sales tax is found in the annual report of A. W. Mellon, Secretary of the Treasury, in which he outlines his views on revenue reforms for the next fiscal year.

In discussing recommendations for a reduction in the surtax rates, Mellon says:

"If this loss of revenue could not be met by rigid economy in expenditure, the revenue required could be raised either by placing a tax on certain specific articles, or by a low-rate general tax on a broad class of articles or transactions.

"Such taxes as those now imposed on automobiles and tires have been found simple and inexpensive of administration and the collection is always substantially current; they have been steadily productive of revenue and have been without injurious effect upon the country.

"In view of past experiences, a general tax either of this or like character upon a broad class of articles or transactions could be readily administered; and the rate could be made sufficiently low as not to bear unduly upon any class and at the same time produce a large amount of additional revenue."

### Smoot Hopeful

If this proposal is adopted it probably will mean the elimination of the obnoxious excise taxes which the automotive industry now is paying while almost all other important industries have been exempted.

Senator Smoot, who is the foremost advocate of the sales tax, told AUTOMOTIVE INDUSTRIES to-day that until he had read Secretary Mellon's report carefully he would not venture an opinion on it. He added positively, however, that "a sales tax is coming."

"I wouldn't go so far as to say it would come at the present session, but once adopted I know it never will be dropped."

### Most Easily Applied

Senator Smoot said the manufacturers' sales tax was the form most easily applied and that it would be as good as any. He does not believe the revenue raising possibilities of a sales tax should be applied for a soldier's bonus, but that when a bonus plan is adopted, as it undoubtedly will be at this session, a specific appropriation should be made by Congress to provide for it.

### SHORT DRIVEAWAY MADE

NEW YORK, Dec. 12.—One of the shortest driveaways on record here took place when the Poertner Motor Car Co., New York distributor, took away 50 cars from the Long Island City plant of Durant Motors.

## Meyer Will Address Export Convention

Asked to Discuss Aid That War  
Finance Corporation Can  
Give Industry

NEW YORK, Dec. 12—The tentative program of the export managers' convention of the National Automobile Chamber of Commerce, to be held in New York on Jan. 10, during show week, names the speakers as Eugene Meyer, Jr., director of the War Finance Corp.; S. T. Henry of the Allied Machinery Corp., a representative of the United States Bureau of Roads; Gordan Lee, chief of the automotive division of the Bureau of Foreign and Domestic Commerce, and G. F. Bauer, secretary of the N. A. C. C. foreign trade committee. In addition, several topics of immediate importance are named for discussion by the attending export managers and factory executives.

Meyer has been asked to discuss how the War Finance Corp. can aid in financing foreign shipments of automotive products, and Henry will tell what the American exporter can do in promoting road construction in Latin-America. The representative of the Bureau of Roads will discuss governmental assistance in road building, and Lee will take up the work that the new automotive division is doing in aiding the industry in building up foreign sales.

The talk by Bauer will be the presentation of a plan for consolidation under the Webb-Pomerene law of the export activities of all N. A. C. C. members. Although the plan has not been made public, Bauer has worked out an organization that will be put up for consideration and action.

The topics to be discussed are:

What should be done to create and protect good will for American automotive products shipped abroad?

What can be done to obtain more intensive distribution of American motor vehicles in foreign countries?

What uniform practice should be followed by manufacturers with regard to requests of foreign dealers for omission of certain standard equipment?

## Kraus Engine Taken Over by Fuel Oil Motors Corp.

NEW YORK, Dec. 12—The Fuel Oil Motors Corp., a New York corporation, has taken over the business of the Kraus Engine Co., which holds a controlling interest in the Kraus Auto Oil Motor Corp. This latter concern is developing the Kraus fuel oil engine for marine and similar purposes.

The principle on which the Kraus engine works is substantially as follows: In a four cylinder engine, for instance, two of the cylinders constitute an air compressor, the air from which is fed into a crude oil burner of the spraying type. The combustion chamber of this burner is of L shape and is water jack-

## DEALERS CONDEMN USED CAR BONUSES

NEWARK, N. J., Dec. 12—The board of trustees of the Newark Automobile Trade Association has adopted a resolution in which it asserts that the automobile business throughout the country is being harmed to a considerable extent by the practice of certain manufacturers in offering special bonuses to be used as additional discounts when trading in used cars.

The resolution states that investigation shows that these special bonuses are exerting a demoralizing influence, and as a consequence the custom is "most heartily condemned" by the association. Copies of the resolution will be sent to every motor vehicle manufacturer in the country with the request that these bonuses be discontinued so that business conditions may be more quickly stabilized.

eted. At the end of the combustion chamber farthest from the fuel nozzle, water which has been preheated by the exhaust is forced into the burner and is converted into steam by admixture with the hot gases of combustion.

This mixture of steam and gases of combustion is used expansively in the two remaining cylinders. The exhaust consists mainly of steam which, of course, can be condensed. Unusual economy of operation is claimed, due to the use of a fuel selling at a very low price. The speed and power of the engine are controlled by a throttle valve in the passage from the burner to the engine inlet valves. The two power cylinders operate on the two stroke principle, every down stroke being a power stroke.

## Barco Battery Changes Methods of Distribution

DETROIT, Dec. 12—Barco Battery Co. has made a complete change in its distribution methods and in the future will handle its sales through permanent district managers who replace the former factory sales representatives.

The following district managers have already been appointed: Alvan W. Dodge, Connecticut, with offices in Hartford, formerly assistant sales manager Chevrolet Motor Co. of Connecticut; George R. Flinn, New England except Connecticut, offices in Worcester, Mass., formerly with B. F. Goodrich Rubber Co.; Pierson R. Cummings, New York State, offices in New York City, formerly with Baker R. & L. Co.; C. W. Russell, New Jersey, offices in Newark, formerly with National Scale Co.; Harold W. Harwell, Pennsylvania, offices in Philadelphia, formerly with Henderson Tire Co., and Saunders & Wetmore, offices in Cleveland, Wetmore formerly being with Carbon Seal Co., Pittsburgh.

## Seiberling Appoints His Sales Personnel

Chooses Former Goodyear Associates—Will Make New  
Tire at Portage

AKRON, Dec. 14—The complete sales personnel of the new \$10,000,000 Seiberling Rubber Co. includes district managers for branches in twelve of America's largest cities. I. R. Bailey, formerly with Goodyear, is Seiberling's sales manager, and H. L. Post is assistant sales manager. All of the district managers are former Goodyear field representatives and officials.

W. A. Golden will be branch manager at Boston, Wade Aydelotte at New York, J. E. Vail at Philadelphia, H. E. Langdon at St. Louis, L. C. Gates at Chicago, J. L. Cochran at Detroit, W. H. Ector at Dallas, R. L. Ritchie at Kansas City, W. F. Ong at Cincinnati, F. E. Argus at Los Angeles, W. T. Stanley at Minneapolis, and H. I. Walters at Atlanta, Ga. C. C. Jones will have charge of the Akron branch.

## Installs New Equipment

Seiberling is transferring all fabric tire machinery from the Portage plant at Barberton to the Lehigh tire plant at New Castle, and is installing new equipment so as to build the new Seiberling cord tire exclusively at the Portage plant.

Seiberling as yet has not revealed the nature or design of his new cord tire. A statement issued by the company, however, intimates that the new tire will be something unusual and an important contribution to the automobile industry.

Seiberling, as an inventor in the early days of the tire industry, devised the first tire-building machine and demonstrated the superior uniformity and lower cost of the machine-made tire. He also introduced the cord-tire fabric adopted by practically all cord tire builders.

Announcement of the new tire is to be made about the first of the year.

## Independent Motors Co. Consents to Receiver

YOUNGSTOWN, OHIO, Dec. 12—Charles G. Smyth has been appointed receiver for the Independent Motors Co. upon a petition filed by the Wilson Avenue Land Co., which has a claim for rent unpaid since August as well as a bill of \$600 for work done. It was asserted in the petition that many other creditors having large unpaid bills were threatening to levy on the property.

The corporation consented to the receivership. It was stated that the company has a large number of trucks in process, but that if levies were made upon the property it would cause sharp depreciation of property value, which would not be the case if the business was kept running.

## Opens Specialized Vehicle Campaign

### Continental Motors Takes First Step to Overcome Any Existing Prejudice

DETROIT, Dec. 10—Pursuant to a plan agreed upon among the larger units parts makers to place cars and trucks made of specialized parts in a stronger position to compete with cars made all under one roof, Continental Motors Corp. is firing the first gun in a campaign of education in which it says:

"Specialized vehicles are composites of superior parts—designed and manufactured by organizations of specialists. They represent the best engineering and productive brains of the industry. Therefore, experienced users of motor cars and trucks purchase specialized vehicles.

"The parts embodied in specialized vehicles are the products of highly developed organizations, each one of which has concentrated all its skill and effort upon perfecting just one part. On the superiority of such parts, great organizations, working in harmony, stake their business futures.

"From specialized vehicles, backed by national parts service, buyers of cars and trucks expect maximum efficiency and economy. And they get it. They get it because specialized vehicles are qualified, part by part, to deliver the utmost in performance—qualified for instance, by such units as the power-plant that bears on its crankcase that ultimate symbol of motor-building specialization—the Continental Red Seal."

The various phases of this argument for specialized unit vehicles will be carried to the motor car buyer in turn by the other manufacturers of units who are united in the movement over their own signatures. The campaign will be carried indefinitely until the companies are assured that any possible former prejudice against the so-called assembled vehicles has been overcome.

### Coupe Proves Popular in Columbus Territory

COLUMBUS, Dec. 12—With the approach of real winter weather and the holiday season, the demand for passenger cars in Columbus and central Ohio territory has slowed down materially. But this usually happens at this time of year and has been discounted by dealers and distributors generally.

Enclosed cars are still the best feature of the passenger business. Dealers are reporting many sales of enclosed jobs, including sedans, limousines and coupes. The coupe is probably the most popular body at this time, although there are a number of calls for sedans.

### FINDS LITTLE KAR SOLVENT

HOUSTON, Dec. 12—A jury in District Court here has decided that the Little Motor Kar Co. was solvent at the time a receiver was appointed and that it still is solvent. In their petition to the court, the trustees of the company charged that Everett S. Owens was ap-

## PENNSYLVANIA FARMS USE 8,500 TRACTORS

HARRISBURG, Dec. 12—That the use of the tractor on the farms of Pennsylvania is being well maintained, is indicated by the fact that on Nov. 1, of the present year, there were approximately 8500 farm tractors in use throughout the State.

One year ago there were approximately 6800 tractors on the farms of the State. That there is plenty of sales opportunity is found in the fact that the horse still maintains its supremacy, as less than 5 per cent of the State's farms have machines.

Since the smaller tractors are being sold quite extensively in the cities for industrial purposes and as some of the larger have also been put to such use, the figures do not cover all the tractors in use in Pennsylvania.

pointed upon the request of holders of "gratuitous stock." The trustees have applied for the lifting of the receivership and have obtained an injunction prohibiting the sale of the plant as proposed by the company.

### New York Holds Back for Show Offerings

NEW YORK, Dec. 12—Though a fairly good run of pre-Christmas buying has helped to stimulate business this month, the New York passenger car market generally speaking is in its usual condition this time of year of waiting to see what is new at the shows. Most dealers have had a better first week in December than the average November week but they do not expect the month as a whole to come up to November because after the 15th or at the latest the 20th, practically no Christmas sales are made and the show is so near that it is difficult to get contracts signed.

November registrations of new cars in ten counties in and around New York as reported to dealers by Sherlock & Arnold, publishers of the *Automobile Sales Analysis*, were 2793, as compared with 3931 in October. The summary of the year to date follows:

	Approximately below \$2,500	Approximately above \$2,500	Total
January .....	483	146	629
February .....	1,409	210	1,619
March .....	3,396	488	3,884
April .....	4,811	575	5,382
May .....	5,468	584	6,052
June .....	6,522	495	7,017
July .....	5,457	386	7,017
August .....	4,216	350	4,566
September .....	4,004	331	4,335
October .....	3,506	426	3,931
November .....	2,425	368	2,793
Total to date....	41,732	4,359	46,091

## Eight Sales Daily Are Made in Atlanta

### Other Cities in Southeast Show Same Ratio—Country Business Slack

ATLANTA, Dec. 12—Retail automobile sales in Atlanta during November, including new and used passenger cars and new and used trucks, averaged about eight per day, total sales for the month being materially less as a whole than during October. The primary demand was for low priced and medium priced cars and light trucks, mainly Ford, Dodge Brothers and Buick. Ford sales are holding up unusually well, and there is also a fair demand for enclosed cars. As a whole, conditions are much better than they were at this time a year ago, and the outlook for the coming year is many times better than it was in December, 1920.

In the larger cities of the Southeast, including such centers as Savannah, Macon, Augusta and Birmingham, passenger car and truck sales during November have been in about the same ratio as in Atlanta, but in the smaller and rural communities comparatively few sales are being made. Agricultural conditions in the Southeast are at an exceptionally low ebb and the outlook does not portend any immediate improvement.

Tractor sales are holding up fairly well, especially in industrial lines, and there is promise of improvement shortly as lumber mills of the section are expected to start up operations again in the next 30 or 60 days. As this has been virtually a closed market for the past year or more, dealers are expecting to sell many tractors to the logging interests when conditions merit resumption of operations.

### G. M. Will Draft Code of Practice for Shows

DETROIT, Dec. 12—A code of practice governing the exhibition and sale of General Motors Corp. cars at the national shows and the local shows of 1922 will be drafted by the advisory board of the corporation following a meeting of sales executives of all units this week.

In the exchange of experiences valuable suggestions on the arrangement of exhibits, presentation of cars and selling helps were received. These will be embodied in the show code which will be printed and issued to all dealers and distributors.

### LOCKWOOD ASKS BANKRUPTCY

KANSAS CITY, Dec. 12—John F. Lockwood has filed a petition in bankruptcy, listing obligations around \$300,000, which are his endorsements on paper of the Lockwood Mfg. Co., of which he was president and which went through bankruptcy this year.

## Road Engineering Syllabus Approved

Work Prepared for Use of Students in Colleges Is Submitted

WASHINGTON, Dec. 12—A tentative syllabus designed to meet the need for a short university course in highway engineering and highway transport engineering has been prepared by Prof. Lewis W. McIntyre of the University of Pittsburgh. It is not yet in final form but it is the most complete work of its kind yet prepared.

The syllabus was considered and approved by the Highway and Highway Transport Education committees headed by Dr. J. J. Tigert, United States commissioner of education, at a meeting here Friday. There are at present no text books on this subject although one is in course of preparation by Professor Blanchard of the University of Michigan.

Suggestions will be welcomed by the committee in the final outline of the syllabus which has developed an outline for a course of study with references which will permit use of all the available information on the subject. This information is being assembled by the committee and co-ordinated for the use of colleges.

The education committee made tentative plans for the holding early next year of the second national conference on highway engineering education. Reports will be made at this meeting of the substantial progress which has been made since the first convention two years ago. All groups interested in this phase of educational work will be invited to send representatives. The date for the meeting has not been determined.

H. W. Alden, vice-president of the Timken-Detroit Axle Co., met with the committee for the first time as a representative of the Society of Automotive Engineers. Alden was in charge of the Government tank program during the war.

## Greene to Direct Sales of Thompson Wheels

NEW YORK, Dec. 12—W. M. Greene, New York branch manager and eastern representative of the Wire Wheel Corp., has resigned to become manager of sales for the Thompson Lattice Wheel Corp., incorporated in New York for \$100,000. Six years ago Greene joined the staff of the George W. Houck Co., the original manufacturer of triple laced wire wheels in America whose interests were later absorbed by the Wire Wheel Corp. in America.

The Thompson Lattice Wheel Corp. is the name of the new selling corporation that has taken over the distribution of the Thompson lattice wheel invented by Lewis Irvine Thompson. As its name implies, the wheel is a steel structure of two conical shaped perforated discs.

## OXEN KEEP MORE MEN BUSY, VILLA SIGHS

DALLAS, Dec. 12—Pancho has returned to the ways of his fathers.

No longer does the automobile buzz or the tractors hum on the big ranch of Francisco Villa, former Mexican bandit.

The old mule and the one-horse plow have supplanted the big tractors in the cultivation of his acres. The ox cart has taken the place of the automobile and trucks about the big plantation.

"You see," Villa explains, "I have a large number of men following me and depending upon my big plantation for support. They depend upon me for a living, and I had to furnish them with it or they would probably organize bands and start trouble in my territory or elsewhere in Mexico.

"I found that one tractor would do the work of a dozen men on my place. Every tractor I had at work just kept eleven other men out of work. Every truck I used did the work of a half dozen ox carts, but each one left five men idle to loiter about the country and stir up strife. I have done away with them to keep my followers employed."

These two discs are fastened at the rim which is made of either the demountable or quick detachable type and are also securely fastened at the hub. This is an expanding hub which, when expanded, places the desired tension upon the lattice spokes and by means of one adjustment all of the spokes can be tightened at one operation.

Thompson is president and general manager; Charles H. Carter, vice-president, and Greene, secretary and treasurer as well as director of sales.

## Bethlehem Creditors to Get Small Return

PHILADELPHIA, Dec. 9—Creditors of the Bethlehem Motors Corp., in the hands of a receiver for a year, will not receive more than twenty cents on the dollar, according to a statement by C. E. Woods, receiver, at a meeting of the creditors in Allentown. The claims total \$3,000,000.

The hearing in the case before the United States District Court in this city, postponed from Dec. 7, was again postponed to-day. A decree for the sale of the property on March 15 will be entered next week. A master will be appointed to audit the receiver's account as to the validity and effect of a lien filed by the Truscon Steel Co., and as to the extent of the property.

It has been decreed that any rights of the steel company in the case are transferred to the proceeds of the sale of the Bethlehem corporation's property.

## Flange Alterations Suggested to S. A. E.

Other Recommendations Made of Particular Interest to Tractor Engineers

NEW YORK, Dec. 12—Engine and carburetor manufacturers are planning a further simplification of carburetor-flange mountings by the combination of certain carburetor-flange sizes. At the present time four different nominal carburetor-flange sizes are used under 1 in.: ½, ¾, 1 and 1 ¼ in.

At the suggestion of a tractor engine manufacturer the engine division of the Standards Committee of the Society of Automotive Engineers has recommended that the flange dimensions for the ½ in. carburetor size in the present S. A. E. Recommended Practice for carburetor flanges shall be the same as the flange dimensions for the ¾ in. carburetor size and the dimensions for the 1 in. size the same as the dimensions for the 1 ¼ in. size. The adoption of these revisions in actual practice will make possible the elimination of two sizes of patterns and castings which will result in cutting production costs of these parts, especially so for carburetor manufacturers.

The revisions will be acted upon by the S. A. E. standards committee at the annual meeting on Jan. 10 in New York, and subsequently by the members of the society by letter ballot. Other recommendations which will be acted upon and which are of particular interest to tractor engineers and users are: annular ball bearings, roller-chain sprocket-cutters, flexible conduit, fan belts and pulleys, mufflers, iron and steel and non-ferrous metal specifications, lock-washers, clutch facings and tractor drawbar heights.

The recommendation as to tractor drawbar heights is an extension of the present S. A. E. standard which specifies that the height of vertically fixed drawbars on tractors of capacities up to and including four plows shall be 15 in. and of vertically adjustable drawbars on tractors of all capacities from 13 to 18 in. with the tractor on level ground.

## U. S. Products President Asks for Receivership

KANSAS CITY, Dec. 14—Ragner A. Roscoe has asked for the appointment of a receiver for the U. S. Products Co., of which he is president, in a suit filed in the Jackson County Circuit Court. He alleges that the management of the company has diverted receipts and profits to personal uses and that the company is insolvent.

Roscoe states the chief asset of the company to be a contract in the sum of \$36,000 with the Wharton Motors Co. of Texas, part of which has been executed and states that the contract is of reduced value because of the inability to make collections.

## Withholds Financing of Export Shipments

### War Finance Corp. Not Sold on Essentiality of Automotive Industry

WASHINGTON, Dec. 12—The War Finance Corp. has decided definitely not to finance at this time foreign shipments of automotive vehicles and equipment. No statement has been made covering the grounds for this decision and none is expected for it is not the policy of the corporation to explain in detail its decisions.

It is generally believed, however, that the officers of the corporation have not been "sold" on the essentiality of the industry and its importance in the industrial life of the United States. They apparently have absorbed the idea that automobiles are luxuries and no concerted effort has been made to make clear to them the fact that the automotive industry ranks second in importance only to iron and steel.

The automotive trade division of the Bureau of Foreign and Domestic Commerce will seek the co-ordinated co-operation of the industry to reopen the case and present to the War Finance Corp. the importance to the country of fostering exports and thereby taking up the slack in production which spells the difference between prosperity and the reverse.

### Asks Premier Receivership to Speed Reorganization

INDIANAPOLIS, Dec. 12—A petition asking for a receiver for the Premier Motor Corp. has been filed here by Hiram A. Whitman, a stockholder of the corporation who holds promissory notes of the company aggregating \$4,000. Quincy A. Myers, attorney for Whitman, asserts that the petition was filed to hasten the reorganization which is now under way. I. E. Schaeffer, secretary and treasurer of the corporation, agrees with this statement.

It is claimed that the assets of the corporation are \$2,000,000 in excess of liabilities. A hearing on the receivership petition has been set for Dec. 19.

### Patent Office Conditions Are Set Forth in Report

WASHINGTON, Dec. 13—The report of the commissioner of patents for the fiscal year ended June 30, 1921, sets forth plainly the lamentable conditions prevailing in that office arising from the congestion of applications and the insufficient number of examiners.

Enormous losses of capital result from the holding up of applications for patents which it is necessary to have acted upon before inventions can be financed. Business interests of the country are strongly urging Congress to pass pending legislation increasing the number and sal-

aries of technical men in the patent office and to induce those now employed to remain.

The patent office lost 163 examiners, scientifically trained and members of the bar, from July, 1919, to June 30, 1921, it is pointed out, and these were replaced by inexperienced men, fresh from college, without any knowledge of patent laws or legal training. In the same period, the number of applications for patents increased 34 per cent, while applications for trademarks increased 85½ per cent. At the end of the fiscal year there were approximately 50,000 patent applications awaiting action, as compared with 18,000 in July, 1919.

### Engines in New Oakland Model 34D Guaranteed

PONTIAC, Dec. 12—The Oakland Motor Car Co. has announced that it will guarantee the motors in its new 34D models against what is known as "oil pumping" for 15,000 miles, or over a period not exceeding two years. This special written guarantee will be given by every Oakland dealer. The main provisions of the guarantee is contained in the following paragraph:

"Should the engine of this car fail to perform properly due to the presence of excess oil in the combustion chamber (commonly known as 'oil pumping' and evidenced by oil on the sparks), the Oakland dealer who delivered this car to you will remedy the cause of the trouble without cost to you of either material or labor."

### To Redesign Line

DETROIT, Dec. 12—The Oakland line of General Motors will be redesigned along the lines of the sport model recently introduced which has proven to be the popular member of the Oakland family and mainly responsible for that company's continued high production. New models in all Oaklands will be shown at the New York show, all displaying the sport features, and these will be the only new models exhibited by any General Motors unit. A production mark of 18,000 Oaklands has been set for the first eight months of 1922.

### GEAR RECEIVER NAMED

BOSTON, Dec. 13—A receiver has been appointed for the Crofoot Gear Works, Inc. An inventory of the property is being taken and as soon as it is completed a report will be filed showing the condition of the corporation. An effort will be made to liquidate the company at the lowest possible expense. Creditors holding a majority of the unsecured claims have signified their approval of the appointment of George E. Howe as receiver.

### BATTERY DEALERS ORGANIZE

DETROIT, Dec. 10—A battery chapter of the Michigan Automotive Trade Association was organized here this week with about twenty battery dealers and distributors signing as charter members.

## Body Company Buys Old Moore Factory

### United Automotive Consolidates With L. C. Graves Co. and Locates at Danville

DANVILLE, ILL., Dec. 12—The United Automotive Body Co., which has been consolidated with the L. C. Graves Co. of Springboro, Pa., manufacturer of commercial car and truck bodies, has purchased the plant of the defunct Moore Motor Vehicle Co. in this city and will operate it under the name of the United Automotive Body Co.

The Cleveland offices of the United Automotive Body Co. have been closed and offices established here. The personnel of the Ohio corporation has been retained. F. O. Darling continues as general manager, W. R. House will be manager of the branches, W. H. Paul will continue as manager of the Lansing assembly plant and E. W. Windsor will be sales production manager. A. H. Palm, secretary of the L. C. Graves Co., will be secretary of the new corporation and will supervise the accounting. Other men in the organization are C. E. Rupe, formerly general manager of the Champion Wagon and Waterloo Body companies, will serve as factory manager, and John Fixott, formerly with Traffic Truck Co. as special bus representative. The United Automotive Body Co. has branches at Detroit, Lansing, Toledo and Youngstown. It is expected that operations in the Danville plant will be started within 60 days.

A bulletin sent out by the new corporation states that it is proposed to merge with it many other body builders and that no less than 30 already have signified their interest in the project.

### British Company Joins with Champion Ignition

LONDON, Dec. 2 (*By Mail*)—The Champion Ignition Co. of Flint, Mich., maker of "AC" plugs, whose British interests have hitherto been in the hands of the AC Sparking Plug Co., London, has joined forces with the British Sphinx Plug Co., well known Birmingham manufacturer of mica and porcelain plugs since 1904.

It is intended to continue the manufacture of Sphinx plugs conjointly with the production of British-made "AC" plugs. The British-made "AC" plugs will incorporate all features of the American plugs including electric welding of the side electrodes to the body of the plug and of the central nickel electrode to the screwed terminal and electric sealing of the insulator in the metal body.

### TAKES OVER BOLLSTROM PLANT

DETROIT, Dec. 12—The Ruggles Motor Truck Co. has arranged to take over the plant of the former Bollstrom Motors, Inc., at St. Louis, Mich.

## Trend Moves Toward Exclusive Handling

### Manufacturers Desiring Such Representation of Products Are Rounding Out Lines

DETROIT, Dec. 12—Insistence on exclusive representation by many of the leading companies of the industry is mainly responsible for many of the new models slated for introduction at the national shows. Makers who have been known for years as the manufacturers of heavy and medium priced cars are bringing out light and lower priced cars intended to round out their lines and give their dealers complete lines from the one company.

Some of the older companies, Dodge Brothers, notably, came out some time ago for exclusive representation on the part of their dealers. The theory of exclusiveness has been adopted by other manufacturers and considerable competition has developed to retain the substantial dealerships.

#### Some Retain One Model

A few manufacturers are carrying through on the one model basis. Ford, Dodge Brothers and Lincoln are in this class, as are Hupp, Reo, Earl and Dort. Rickenbacker Motors is starting out in the one price class. General Motors with its line of Chevrolet, Oakland, Buick, Oldsmobile and Cadillac contains a varied assortment of models and prices.

Nash and Studebaker have lines corresponding closely to the Buick and Oldsmobile assortment embracing fours, sixes and big sixes. Others in the four and six field in the Detroit district but operating as separate entities are Hudson and Essex and Maxwell and Chalmers. Chandler and Cleveland have been operating in the big six and little six field as has Columbia, and to this field is now being added the Jewett by Paige, the Hanson and perhaps Liberty.

#### Movement Progresses Quietly

The movement to bring about exclusive representation of companies has been proceeding quietly but nevertheless it has been proceeding and 1922 will see more progress in this direction than the industry has known before. The theory back of the movement is that cars are being bought to-day mainly on a dealer personality basis and an owner switching to a higher priced vehicle will buy from the dealer who sold him a satisfactory low priced car.

## Continental to Produce Two New Lines of Engines

DETROIT, Dec. 10—Continental Motors Corp. is about to start production on two new distinct lines of engines, a light six to be known as model 6-Y which is designed to enable manufacturers who have been building big sixes exclusively to build a smaller vehicle rounding out

their line, and a special bus model for vehicles of  $4\frac{1}{2}$  to  $5\frac{1}{2}$  tons, which will be known as model 4-L.

Manufacturers using the light six engine will build it into cars selling at about \$1,000 to \$1,200 and it is expected that cars thus equipped will be seen at most of the shows of the 1922 season. With the light six the Continental passenger line will now include the light, medium and big six in addition to its special models manufactured for special factory designs.

The bus model is especially designed to meet speed requirements and lubrication facility. The truck models made by the company are also undergoing revision along lines permitting of greater speed.

## Greater Tractor Sales Reported in Southeast

ATLANTA Dec. 14—Tractor sales in the Southeast during October and November were materially better than the same two months in 1920, according to factory branch managers in the Atlanta territory.

In east Tennessee sales have been unusually good all summer because of the fact that agriculture is more diversified in that section than anywhere else in the Southeast, and the farmers therefore are more prosperous. In Georgia and North Carolina industrial sales have been unusually good as these two States lead the Southeast in road construction work now in progress.

Thousands of acres of swamp lands in Florida are being reclaimed this year, and tractors are being largely purchased for this work in the southern part of the State. Alabama sales have increased materially the past two months due to the fact that crop diversification was more widely practiced in that State this year than ever before.

South Carolina is the only State of the section where sales are far below normal because of poor cotton and tobacco crops this year. The outlook for winter business is many times better than it was at this time last year.

## Substitute Complaint Filed in Rockwell Suit

HARTFORD, CONN., Dec. 14—Permission to file a substitute complaint has been granted by Judge Avery in the Superior Court in the suit of Albert F. Rockwell against the New Departure Mfg. Co., the company's counsel, John T. Robinson, having a notation made that a pending counter claim of \$30,000 for over payments to Rockwell shall stand.

In his original action, Rockwell sued for \$2,000,000 damages, asking for reformation of his contract with the company for the reconveyance of certain patents to him, the issuance of an injunction restraining the company from using certain patents, and seeking damages for being deposed as president of the company.

## Hercules to Enter Motor Car Field

### Will Produce "McCurdy", 6-Cylinder Automobile, Early in New Year

INDIANAPOLIS, Dec. 14—The Hercules Corp. of Evansville will enter the motor car production field early in 1922 with the "McCurdy," a 6-cylinder car with standard parts and a wheelbase of about 126 in. It is not likely that the car will be ready for the automobile shows, but it is confidently hoped that it will be in readiness for spring delivery.

#### Well Financed

The Hercules corporation, which will launch the car without going outside its organization to finance it, has long been known as one of the largest industrial establishments in its line, that of the making of buggies and carriages, gasoline engines and bodies for trucks and commercial cars. It started 31 years ago in Cincinnati, but moved to Evansville about 20 years ago, and has advanced to the position of one of the largest industrial establishments in Indiana.

It has a record of having produced in one year 84,000 buggies and carriages, 62,000 gas engines and 40,000 bodies for trucks and commercial cars. Its factories cover 31 acres and its sales organization is represented in every part of the country and in Canada, Mexico, Central and South America, and Europe. Last year's sales are said to have exceeded \$12,000,000.

#### Evolved from "Gale"

Col. W. H. McCurdy, head of the corporation; J. D. Crafts, general manager; Lynn McCurdy, son of Colonel McCurdy and vice-president of the concern; and Gard Gale, sales manager, have spent a year in the development of the "McCurdy," which has been evolved from the "Gale," a car designed by Gard Gale and exhibited at the 1920 March Indianapolis Automobile Show. Both Gale and Lynn McCurdy have long been identified with the automobile industry, McCurdy having served as head of a motor transport division during the war. Detailed announcement of the specifications of the car is not yet ready.

## Apperson Branch Replaces Distributor in St. Louis

ST. LOUIS, Dec. 12—In keeping with its policy of establishing factory branches in principal cities throughout the country, the Apperson Bros. Automobile Co. has purchased outright the assets and liabilities of the Apperson-St. Louis Motors Co., former distributor of Apperson cars in St. Louis.

The branch will retain the name and premises of the former company and L. F. Jalageas will be manager.

## St. Louis Discusses Chicago Air Service

### Plans for Reopening of Route Made at S. A. E. Meeting

ST. LOUIS, Dec. 12—The restoration of the airplane mail service between St. Louis and Chicago, which was abandoned July 1, 1921, because of lack of funds, was planned at the first meeting of the Society of Automotive Engineers ever held in St. Louis, which took place at the Claridge Hotel last night.

All the speakers touched on the future of the airplane, the principal speaker being Col. J. G. Vincent of Detroit, vice-president of the Packard Motor Car Co., past president of the S. A. E. and one of the designers of the Liberty motor for war airplanes.

Postmaster Colin M. Selph said that he had a conference with Representative L. C. Dyer before the latter departed for Washington, in which the congressman stated he would introduce a bill for the reestablishment of the St. Louis-Chicago air mail service as soon as possible.

The meeting pledged its co-operation in urging the passage of the bill and in improving the landing field in Forest Park to permit the use of large airplanes capable of carrying more than the 150 lb. of mail which was the limit of the previous airplanes. Colonel Vincent expressed approval of the plan and declared that the air mail service would form a great nucleus about which the development of the airplane would center.

Colonel Vincent showed motion pictures of flying scenes at several leading fields and explained recent improvements such as the reversing of the propeller and the action of the airplane parachute.

The St. Louis Automobile Manufacturers and Dealers Association joined with the society in promoting the meeting. George P. Dorris, president of the Dorris Motor Car Co. and Western representative of the S. A. E., presided.

## To Get Export Data by Questionnaires

WASHINGTON, Dec. 12—The export committee of the National Automobile Chamber of Commerce has agreed to bear the expense of obtaining from greatest foreign potential trade centers definite information concerning the possibilities for the sale of American automotive products. The work will be done through the automotive trade division of the Bureau of Foreign and Domestic Commerce.

The plan as outlined contemplates obtaining the services of reliable men who will answer by cable once a month a questionnaire which will be sent to them. The information contained in these replies will be analyzed and tabulated here. It then will be supplied to the en-

## WALLIS TRACTOR WINS IN PLOWING CONTEST

RACINE, Dec. 12—The fourteenth annual plowing contest under the auspices of the Pilot-Rock Association in Cherokee County, Iowa, was won by J. E. Bushlow driving his own Wallis tractor and pulling a genuine J. I. Case three bottom plow. He also won the first prize last year with the same outfit. The second prize in this class was won by a Twin City tractor, while the third and fourth prizes were taken with Wallis tractors.

tire industry. Although the N. A. C. C. will bear the expense, the information will not be for the exclusive benefit of its members.

The automotive division of the bureau is preparing to send to all automotive manufacturers a questionnaire which will give detailed information on their exporting practices. The individual replies will be held strictly confidential, but the general results will be analyzed carefully and made available to the entire industry.

## Employment in Industry Increased 2.7 Per Cent

WASHINGTON, Dec. 14—Increased activity in the automobile industry was the one bright spot of the industrial situation for November, according to an analysis of reports received from special agents of the United States Employment Service, Department of Labor, from 1428 firms usually employing 501 or more, located in 65 principal industrial centers of the country.

The data show that employment increased in the industry 2.7 per cent in November, as compared with the previous month, the actual increase from the firms reporting to the Government amounting to 4531 workers.

Reports from 70 automobile firms in Detroit show that 4398 workers were recently added to their forces, bringing the total employed up to 115,802. Half of this number are working on part-time schedules.

In Dayton, automobile industries are working on a conservative basis. The report shows that part-time employment in Toledo is more prevalent in the automobile industry and accessories. There is the usual seasonal falling off in the parts and accessories industry in Milwaukee.

## CHARGE RIVER ENCROACHMENT

ROCKFORD, ILL., Dec. 12—The Cotta Gear Co. and Charles Cotta, manager, have been indicted by the Federal grand jury in Freeport for encroachment upon the Rock River. It is the first indictment of its kind ever returned against a Rockford firm.

## Goodyear President Visiting Argentina

### Will Conduct Survey of Tire Trade Conditions in South America

AKRON, Dec. 14—E. G. Wilmer, president of the Goodyear Tire & Rubber Co., has left for South America, where he expects to conduct an extensive survey of tire trade conditions, especially in Argentina, the central South American distributing point for Goodyear tires. Wilmer will also inspect Brazilian property acquired some time ago by Goodyear for the erection of a South American tire building factory.

During Wilmer's protracted absence, affairs at Goodyear will be in the hands of H. A. Springford, who has been elevated from the position of treasurer to that of special assistant to the president. P. H. Hart, assistant treasurer and formerly with Price, Waterhouse & Co., in charge of the Goodyear audit prior to the company's reorganization last May, has been elected treasurer.

Personnel changes made to fill vacancies created by the resignation of many Goodyear veterans who have joined F. A. Seiberling in his new rubber company, have been announced by Sales Manager L. C. Rockhill. H. J. Thompson succeeds H. L. Post as manager of the sole and heel sales. K. W. Wolcott is made assistant to Thompson. H. P. Post becomes assistant manager of the mechanical goods department, succeeding C. A. Jones. F. W. McConkey succeeds H. I. Walters as southern division manager of tire sales and D. O. Kinney succeeds L. C. Gates as manager of motorcycle tire sales. T. J. Moorse assumes the editorship of *The Triangle*, the Goodyear salesmen's bulletin, succeeding H. A. King, now director of sales personnel for Seiberling.

Arthur Spore, formerly with Goodyear, returns as assistant advertising manager, succeeding Frank Griffin, now advertising manager of the new Seiberling company.

## Policy for Membership in N. A. D. A. Changed

ST. LOUIS, Dec. 12—Future membership in the National Automobile Dealers Association will be limited to those merchants who have been in business two years, who have first-class credit and financial rating and who carry not only the endorsement of their fellow dealers, but the confidence of their buyers.

Membership dues in the organization are to be changed from the payment of \$10 per year to a grade of classification of \$50 per annum as the lowest dues and \$250 as the highest. The new regulations are effective Jan. 1, 1922.

"The change is made to meet the economic condition" is the statement issued by the association and signed by the board of directors.

## Willys Receivers Hold Conferences

### Inventory of Assets Likely to Be First Step in Their Ad- ministration

NEW YORK, Dec. 14—C. O. Miniger, president of the Electric Auto-Lite Corp. of Toledo, who is receiver for the property of the Willys Corp. in Ohio, New Jersey and New York, arrived here yesterday for conferences with Colonel Francis G. Caffey and Clifford I. Voorhees, who are his co-receivers in the southern district of New York and in New Jersey.

Details of procedure in each district will be worked out while he is here. It is probable the first step will be to take a careful inventory of all the assets. Inasmuch as the productive units of the corporation usually would be closed about this time for inventory taking, no hardships will be involved by this process. The most important of these units are the Electric Auto-Lite and the New Process Gear Corp. at Syracuse.

#### To Continue Operations

After the inventory, operations in these plants will be continued virtually as before the receivership, although all possible economies will be instituted. The next step probably will be an attempt to sell the Chrysler plant at Elizabeth, which is the cause of all the corporation's financial difficulties. So far as can be learned no negotiations for the purchase of this property are pending.

No steps looking to a reorganization and possible refinancing have been initiated thus far and it is probable several weeks will elapse before anything definite is done along this line.

Miniger was reappointed a co-receiver of the New Jersey property yesterday by Federal Judge Bodine, who removed him two weeks ago upon the petition of bank creditors who have since then agreed to co-operate fully in the receivership.

#### Other Courts Act

Miniger and F. P. Kennison, one of the receivers for the Ohio property, and Mayor George R. Lunn of Schenectady have been appointed by Federal Judge Cooper receivers for the holdings of the corporation in the northern district of New York. This includes the New Process Gear plant.

An order signed by Federal Judge Knox in the southern district of New York removed Kennison in this district and left Miniger and Caffey as receivers.

Federal Judge Killits appointed Colonel Caffey receiver to work with Miniger and Kennison in the Ohio district. Mayor Lunn visited Toledo the early part of the week and conferred with Kennison on plans for reorganization.

Notwithstanding opposition by attorneys for the corporation, Federal Judge Morris, sitting at Wilmington, appointed

## FORD PRODUCTION WILL SURPASS 1920

DETROIT, Dec. 14—The Ford Motor Co. will continue operations on its four days a week schedule up to Dec. 21, when it will close for inventory and will remain closed until shortly after Jan. 1. Completion of its year's schedule will show a slight increase over 1920, which totaled 1,023,552. Indications for 1922 business are regarded as highly favorable by executives, and production will resume after the inventory, taking on at least as heavy a schedule as marked the closing of 1921.

Robert H. Richards, former attorney general of Delaware, as receiver in that State. Only one receiver was named and it is possible Miniger may be appointed to serve with him unless it is decided to lift the receivership in that State.

A receivership petition was filed in Delaware by the bank interests before the signing of the "treaty of peace" last week. The action was taken upon the ground that inasmuch as the Willys Corp. is incorporated under the laws of Delaware, receivers named in that State should take charge of all its assets wherever they may be located.

#### Oppose Delaware Motion

In opposing the Delaware application, attorneys for the company took the ground that there are no tangible assets in that State and that all assets of the corporation are already in the custody of the receivers. Judge Morris held that under the laws of Delaware, as interpreted in a long line of decisions, no course was open to him except to appoint a receiver. He fixed the bond of Richards at \$20,000.

Robert A. Thatch, of counsel for the corporation, in arguing that there was no necessity for a Delaware receiver inasmuch as there were no assets in that State, pointed out that two alternatives faced the defendant. One of them is a successful plan of reorganization and the other the winding up of its affairs. If the latter course became necessary he believed it possible there would be a residue which would come into the hands of the Delaware courts for distribution. It also was stated that inasmuch as all interested would profit by continuing the business, the bank creditors would be willing to defer the appointment of a Delaware receiver.

Judge Morris held, however, that he had no option but to appoint a receiver.

#### SUES FOR BODY RECEIVER

INDIANAPOLIS, Dec. 14—Suit for a receivership for the Indianapolis Body Corp. was filed in Superior Court here by Peter M. King, who asks judgment for \$10,000 alleging that a balance of \$3,563 on five notes is due him.

## Oregon Completes Study of Road Cost

### \$3,000 Necessary to Maintain One Mile of Pavement for Year

PORTLAND, ORE., Dec. 14—Figures relative to cost of maintenance of highways in the State of Oregon were issued here to-day by Herbert Nunn, State highway engineer, who recently completed an exhaustive study of the subject to secure data upon which to base a law regulating for-hire truck and bus operation, and the subject is now demanding the keen interest of automobile and truck men throughout the entire State.

Cost to the public of Oregon for maintaining one mile of pavement for one year is \$3,000, while the cost of maintaining a mile of macadam is \$1,675, according to Nunn's report. The cost for each vehicle mile is given as 0.01 cent for pavement and 0.015 cent for macadam. For trucks, each ton mile on pavement costs the public 0.01 cent, and on macadam 0.015 cent. The cost per passenger mile is figured at 0.002 cent.

The figures take into consideration all kinds of depreciation, Nunn explained, not only to the pavement itself, but to the grade, cuts, fills, drainage, and interest charges on road bonds.

What the new regulations governing for-hire trucks and buses will be cannot yet be foretold, but it is said the truck men offer no objection to the present regulation limiting the total load to 22,000 lb. nor to the present speed regulations. A system of insurance for passengers and for granting licenses to bus lines on the basis of continuous and satisfactory service, eliminating the fly-by-night driver, are considered sure of incorporation in the new law.

## South African Demand for New Cars Improves

NEW YORK, Dec. 12—Automotive conditions in South Africa are summed up as follows in the current business review of the National Bank of South Africa:

"The tendency of the market for new cars is toward a decided improvement. The country districts are displaying more interest, and it is stated that a fair number of sales has been effected. The used car market is not so good."

The review was written at Pretoria, on Sept. 30, before the present upward movement began in sterling exchange, which has brought that currency upward to its quotation to-day of slightly less than \$4.15, at which rate it is less than 15 per cent below par. The South African bank statement adds to the foregoing that reports from Johannesburg are "optimistic in tone, and better conditions are looked for even during the remainder of the year."

## Waste Elimination Movement Started

### Secretary Hoover Creates Division —Automobile Manufacturers to Meet with Him

WASHINGTON, Dec. 14—In an effort to co-ordinate and forward the movement for the elimination of waste in the automobile industry, a meeting of automobile manufacturers may be called within a few days under the general direction of the Department of Commerce for the purpose of instituting a variety survey and other studies necessary for eliminating excess sizes and varieties.

A division has been established in the Department of Commerce by Secretary of Commerce Hoover for the purpose of assisting industry to decrease sales resistance and obtain better service through the possible elimination of any duplication of parts where questions of dimension, not of style, are at issue. It is expected that in the event this program is carried out it will assist in reducing the production costs of passenger cars, trucks and tractors.

#### Durgin in Charge

Secretary Hoover has placed William A. Durgin, for several years public utility expert for the Commonwealth Edison Co., Chicago, in charge of this activity. Mr. Hoover has made it clear that the department's policy in this matter is almost a complete reversal of governmental policies, for, instead of ordering industry to put into effect certain reforms, the department is asking business what the Government can do to help it in its problems.

The Secretary describes the movement briefly as follows:

"There is a great area of waste in American industry that can only find correction at the hands of the manufacturers, and can only find it in a purely voluntary action on their part."

#### No Compulsory Methods

In other words, Mr. Hoover insists that the simplification proposals must be inspired by the manufacturers themselves, as it is not the desire of the Department of Commerce to enter into any compulsory methods. In this connection, he says:

"I do not believe that the impulse and progress of American industry can come from Government legislation or interference; but there are occasions, I think, when the friendly help of the Government can furnish a center point for the communication and discussion of manufacturing groups and those professions and trades with which they must also come to some conclusion have been well selected."

The movement indorsed by the Department of Commerce covers such questions as nomenclature, dimension, simplification, and variety, without interference with style. Suggestions for simplification have been submitted to the department but their consideration will be postponed until a conference is called

## AUTOMOBILE INDUSTRY IS FIRST IN BUFFALO

BUFFALO, Dec. 12—Automobiles, bodies and parts now lead Buffalo industries.

This is shown in the Yearbook of Buffalo, containing the 1920 industrial census of the Buffalo-Niagara industrial zone, which is now being prepared for publication.

The report shows that for the first time the automobile industry has replaced flour and grist mill products and slaughtering and meat packing as the leading industry in the city. These two now run second and third.

between representatives of the automobile industry and the Government. These proposals involve tire dimensions, dimensions of starting and storage batteries, sizes of seats, steering wheels, etc.

If a survey is undertaken by the industry, it will cover cost of car and service to owner and other details which are necessary for the information of a conference. The department will undoubtedly ask the assistance of the Society of Automotive Engineers and use the handbooks of the society.

As an instance of simplification, it is stated that tractor seats can be reduced from 9 sizes to 3, owing to slight differences in width. It is also stated that the survey will deal more particularly with sizes rather than with the number of parts.

(Continued on next page)

## Secretary Denby to Speak at N. A. C. C. Dinner

NEW YORK, Dec. 14—Secretary of the Navy Denby, who formerly was one of the principal owners of the Denby Motor Truck Co., will be the guest of honor at the annual dinner of the National Automobile Chamber of Commerce which will be held at the Commodore Tuesday evening, Jan. 10. The only other speaker of the evening will be Irvin S. Cobb, the celebrated humorist. Colonel Charles Clifton, president of the N. A. C. C., will preside as toastmaster.

The arrangements for the dinner are in charge of a committee of which Pierre S. duPont, president of the General Motors Corp., is chairman. Associated with him are A. R. Erskine, Alvin Macauley, David S. Ludlum, William Robert Wilson, W. C. Marmon and A. G. Seiberling.

#### Aero Club to Dine

NEW YORK, Dec. 14—The annual banquet of the Aero Club of America will be held at the Hotel Commodore Monday evening, Jan. 9. The dinner will be for members of the Aero Club of America and affiliated aero clubs, the Society of Automotive Engineers, the Automobile Club of America, the Automobile Club of New York and others.

## N. A. C. C. Suggests Contract Changes

### Provision Made for Protection of Dealers in Event of Cancellation

NEW YORK, Dec. 14—Directors of the National Automobile Chamber of Commerce have transmitted to automobile manufacturers certain suggestions for contract changes which the dealers, represented by a special committee of the National Dealers Association, believe will prove mutually beneficial in the distribution of motor cars. While these changes are suggestions only, the directors of the N. A. C. C. believe they are proper ones for consideration by those engaged in the manufacture and distribution of motor vehicles.

#### Maker Must Repurchase

The most important suggestion is that when a contract is cancelled or terminated by the manufacturer, he obligates himself to repurchase at the net price originally charged the stock of the new cars and regular models and such parts as were originally purchased from him which may remain in the hands of the distributor at the date of cancellation. The text of the suggestions follows:

The distributor must furnish to the manufacturer an order for motor vehicles for the period of 12 months in advance for distribution in his territory, covering the allotment of models by months. The manufacturer may ship motor vehicles according to such statement unless the distributor shall notify the manufacturer from 60 to 90 days in advance of a change in the shipping schedule for any month or months. By the giving of such notice, unfilled shipments may be automatically cancelled, provided, however, that every distributor must, during each quarter of the contract year, take at least 50 per cent of his aggregate order for such quarter.

If, for any reason, the manufacturer does not ship during any month the orders specified for that month, such unshipped orders for that month may be automatically cancelled by the manufacturer and be deducted from the allotment to the distributor as specified for that month and in such case the manufacturer and distributor will be released from any further liability for such month on such unfilled order.

#### Excess Orders Optional

Any orders submitted by the distributor in excess of the monthly allotment as above provided may be accepted by the manufacturer at his option and when so accepted shall be deemed to be subject to all the conditions to which motor vehicles ordered by annual allotment are subject.

This agreement shall remain in force and effect until cancelled or terminated with or without cause by the giving of notice by either party to the other party in writing of 15 to 30 days and at the end of the time specified in such notice, this agreement shall be deemed to be in all respects cancelled and terminated.

In the event of a cancellation or termination of this agreement such cancellation or termination shall be the act of a corporate officer,

(Continued on next page)

## New Zealand Imports Decline During Year

### Industry Feels Effects of Efforts to Equalize Balance of Trade

LOS ANGELES, Dec. 12—A radical break in imports during the closing months of the period greatly cut into the total imports of motor vehicles by New Zealand during the first nine months of 1921, as compared with the first nine months of 1920. There were 3560 motor vehicles valued at \$1,100,363 in the first nine months of 1921, as compared with 8479 cars valued at \$1,930,893 in the same period in 1920.

Automobiles suffered with all other lines of merchandise in the campaign waged by the banks and the Government authorities to curtail imports in order to bring about a more equalized balance of trade. Business conditions are rapidly improving in New Zealand, and this market, long noted for its great purchasing strength, will soon be resuming its imports of American automobiles on a healthy scale, providing British manufacturers do not succeed in their efforts to have the preferential rate of duty increased and the general duty increased.

## Fire Damages Templar Plant; Loss, \$250,000

CLEVELAND, Dec. 14—Fire that swept the Templar Motors Co. property at Lakewood, for three hours last night, destroyed property valued roughly by M. F. Bramley, head of Templar, at between \$250,000 and \$300,000.

The main fireproof plant of the Templar property was the only structure that remained untouched by the rain of sparks. The old main plant, a frame structure composed of three buildings, which was built four years ago and in which the parts used for building cars were stored, was completely burned down and about 30 automobiles were lost.

Besides this, he said, about 300 new windshields were lost. He estimated that there was about \$75,000 worth of service stock alone stored in the building. Firemen report the cause of the fire is unknown. President Bramley announced the entire plant will be closed all day to-day. After to-day, however, he said work will go on as usual.

### TO AID FOREIGN TRADE

NEW YORK, Dec. 15—The directors of the Motor and Accessory Manufacturers Association have decided to appoint a foreign trade committee of five to act "as the co-ordinating clearing house and point of contact between the Government officials and the members of the association in carrying out the foreign trade program" of the Bureau of Foreign and Domestic Commerce. The president will select the chairman of the committee who will name his associates.

## PRODUCTION FOR 1921 WILL TOTAL 1,700,000

NEW YORK, Dec. 15—Careful estimates of the total production of motor vehicles by American companies for 1921 indicate that the final figure will approximate 1,700,000. This will include the foreign assembling of cars by Ford and other American companies which have assembly plants in other countries.

Domestic production will aggregate 1,604,000. The domestic production for the first nine months of the year aggregated 1,200,000. The estimated domestic production for the last quarter with figures for October and November practically complete is 403,000. In all instances the figures include both passenger cars and trucks.

The total production for 1920 was 2,205,000 so that the output for this year will be only approximately half a million less than in 1920. The most optimistic estimates made at the beginning of 1921 did not exceed 1,500,000.

## N. A. C. C. Suggests Contract Changes

(Continued from preceding page)

sales manager or other person duly authorized to cancel or terminate sales agreements.

It is agreed that in the event of the cancellation or the termination of this agreement by the manufacturer, said manufacturer obligates himself to repurchase at the net prices originally charged to the distributor, the distributor's stock of new saleable cars of regular models of the current serial year shipped by the manufacturer within six months before, and such parts as were originally purchased by the distributor from the manufacturer, which car or parts are in the hands of the distributor at the date of said cancellation by the manufacturer.

In the event of the cancellation of this agreement by the distributor, the manufacturer at his option may purchase such stock of new motor vehicles or parts, sold by him to said distributor, and on hand at the date of the cancellation or termination of this agreement by said distributor.

It is agreed that the distributor shall furnish the manufacturer semi-annually in each contract year an inventory of parts on hand and shall return such parts to the manufacturer as may comprise an over-stock in the hands of the distributor or which the manufacturer has declared to be obsolete.

The suggestions above apply also from the distributor to the dealer.

### TO PRODUCE DURANT SIX JAN. 15

NEW YORK, Dec. 15—It is expected that the Durant Motor Car Co. of Indiana will begin production of the new Durant six about Jan. 15. Production of the Durant four already has begun on a small scale at the Lansing plant and the Durant Motor Car Co. of Michigan proposes to turn out about 500 cars before the end of the year.

## Waste Elimination Movement Started

### Hoover Forms New Division— Automobile Manufacturers to Confer With Him

(Continued from preceding page)

As to the general purpose of these proposals, Secretary Hoover says:

"We are in a broad sense, confronted with a great many economic difficulties—the necessity to maintain a high wage level, the consequent necessity to reduce all processes of manufacture to the lowest possible costs, and under the compulsion of eliminating every possible waste of industry itself.

"There is one thing that stands out about American industry that comes up daily to the Department, and that is the remarkable efficiency of the individual industry and the very considerable inefficiency of collective industry. If we had the same native efficiency collectively in this country that we have individually, we would have no difficulty in maintaining our own in foreign or international commerce, and of maintaining the high wage levels and the high standards of living. It is only by virtue of some prompt action that we can hope to secure some fundamental readjustments that the country must have.

"During the war, the necessity for the elimination of unnecessary employment, the elimination of the use of unnecessary materials, benefited many industries. There grew up a far different cooperation in industry in the simplification of a great many processes and products. The experience gained at that time, I think, convinced most manufacturers that there was something of permanent value in those ideas.

"There has been an attempt on the part of manufacturers since then in a hundred different directions to come to an agreement and conclusion for themselves that would meet these ends. There is the difficulty of entering into such agreements, the possibility that they comprise some violation of the trade Acts. This administration coming to Washington felt that it could perform a service to manufacturers if it acted as a center point around which their own co-operative action could take place.

"There are a number of industries in which the manufacturers are carrying on their own surveys and are in consultation with the Department, but to make any of this work effective does not lie entirely with the manufacturers, who must have the cooperation of outside groups. This is the first time that we have attempted to bring the groups together, first, the manufacturer, then those who dominate his consumption; so that I am in hopes that we can get results."

The Department of Commerce believes that with the help of the United States Chamber of Commerce it will be possible to see how far an agreement can be reached for the simplification of varieties.

### MAIBOHM SALE POSTPONED

TOLEDO, Dec. 12—Further postponement of the reorganization sale of the Maibohm Motors Co. has been made until Dec. 27, due to the filing of a Federal tax claim. The original date set was Nov. 29, at which time, however, the claim was filed and postponement was taken until to-day.

## Committee Appointed for Mexico City Show

Event Will Open April 16 When  
Easter Crowds Visit  
Capitol

NEW YORK, Dec. 12—The 1922 automobile show in Mexico City will open on April 16, a time at which, because of Easter, the city is filled with visitors from all parts of the Republic. Definite advices concerning the show have been received by *El Automovil Americano*, the Spanish automotive publication of the Class Journal Co., which supplement previous information that the automotive division of the American Chamber of Commerce of Mexico City had determined to hold such an exhibition next spring.

A strong committee of representative dealers has been named to supervise and direct the show, the automotive division of the chamber believing that such committee would assure careful and proper management and would obviate some of the mistakes made in holding the first Mexican show last spring.

The committee follows: James G. Shirley, American Motors Co.; William C. Benbow, Cia. Unida de Ventas, S. A.; V. S. Bowling, Shearer Electrical Construction Co., S. A.; S. L. Carrico, United States Rubber Export Co.; Charles B. Crowley, Mayfield Auto Co., S. A.; W. A. DeGress, Mohler & DeGress, Sucs, S. A.; Simeon F. Fuller, the Mexican Trading Corp.; Frank E. Moore; A. F. Robertson, Robertson Motor Co., S. A.; A. Villalba, Jr., Lamborn & Cia., and Carlos Wille, Cia., Automotriz Mecicana, S. A.

## Chandler Directors Declare \$1.50 Dividend

NEW YORK, Dec. 15—The directors of the Chandler Motor Car Co. at a meeting in Cleveland yesterday declared the regular quarterly dividend of \$1.50 a share payable Jan. 1 to stockholders of record Dec. 24.

By this action they fooled the speculators who had been predicting that the dividend would be passed and who sold the stock short. The price declined to 45½ Monday but sold up to 52 yesterday. It is understood that the Chandler company did not earn the dividend but paid it out of surplus. It is felt that the earnings in the next quarter will justify this action.

## Dent Parrett Elected Head of Tractor Company

CHICAGO, Dec. 13—Dent Parrett has been elected president of the Hicks Parrett Tractor Co. Parrett has long been identified with the tractor industry. He was the originator of the Parrett tractor and founder of the producing company. During the war he was dis-

associated with this work through his activities at the Holt plant in Peoria and the Chandler plant at Cleveland, where he served in the capacity of major in the army.

Since the war Parrett has devoted his time to working out engineering plans for tractor improvements and the development of a combination light tractor and cultivator to be sold at a price around \$600. This model, with the improved models of the Parrett three and four-plow tractors, will be shown at the National Tractor Show at Minneapolis in February.

## Gray Will Exhibit Cars During New York Show

DETROIT, Dec. 14—Gray Motor Corp. will exhibit two cars at the Commodore during the week of the New York show which, it is reported, will sell under \$500. Drawings of the car seen in the offices of the company indicate a very high class looking product more commodious than the usual run of car in the extreme low priced class.

The plan of the company to assemble the car in assembly branches in principal cities of the country, means that it will be a specialized unit vehicle, and specifications are being placed with leading unit parts makers seeking the highest possible construction value in the price class.

If the plans of the company are carried through, unit parts makers will have an opportunity to participate in the manufacture of a car in the bottom price class.

## Firestone Preferred Stockholders May Vote

AKRON, Dec. 14—Preferred stockholders of Firestone Tire & Rubber Co. will be entitled to vote at the annual meeting scheduled for Dec. 15, according to a circular letter mailed to shareholders. The reason assigned is that the ratio of net quick assets has not been maintained, which entitles both 6 per cent and 7 per cent preferred to voting powers.

It is only because of the fact that charge-offs for inventory depreciation and complete absorption of losses have been made that net quick assets are below ratio. Inventories have been placed at or under market levels.

All losses have now been absorbed, the company is in a sound financial position and in the best operating and sales position in its history, according to officials.

Firestone Tire & Rubber has \$10,000,000 each of 6 per cent and 7 per cent preferred stocks outstanding. It is provided that net quick assets equal to 150 per cent of 6 per cent preferred outstanding and 250 per cent in net tangible assets must be maintained. It shall also maintain net quick assets equivalent to 125 per cent of the 7 per cent preferred and 200 per cent in net tangible assets. Each class of preferred stock shall have voting power in the event that the ratio of assets is not maintained.

## Peruvian Dealers Reduce All Stocks

Accessories and Tires Scarce—  
No Excess of Popular  
Priced Cars

LIMA, PERU, Nov. 30 (By Mail)—During November dealers in automobiles have either advertised reductions in price or quickly made reductions when effecting sales. Little by little the stock of automobiles, accessories and tires has been reduced, until now in the popular priced car (Ford) there is no excess stock; and in the accessories and tires of the popular priced cars, there is scarcity rather than excess stock.

Two unfavorable, one neutral and two favorable symptoms may be noted in the general situation in Peru to-day. In the valley of Chicana, the heart of the sugar industry, there is industrial discontent, which has hurt the sugar trade and consequently adversely affected business in general. The political uprising against the Government in Iquitos, and the discontent of the native Indians in the region of Puno, although not serious so far, may spread.

The neutral element is the proposed loan from North America. A group of financial experts from the United States is here now examining the resources of the country to see if they warrant the amount sought. As long as there is hope of securing the loan, the present condition will not grow worse; and until the loan is secured present conditions will not improve. So the neutral element is perhaps the predominant one in the Peruvian business world to-day.

The two favorable features are increased movement in business as indicated by heavier advertising in the daily papers. The number and size of the advertisements appearing to-day are far greater than three months ago. Automobiles and accessories come in for their share of the increased advertising.

## AUTOCAR REDUCES PRICES

ARDMORE, PA., Dec. 14—The Autocar Co. has announced a reduction in prices on its standard truck, effective Jan. 3. The type F with a 97-in. wheelbase is reduced from \$2,300 to \$1,950 and type G with a 120-in. wheelbase from \$2,400 to \$2,050. The new 2-ton heavy duty truck with a 114-in. wheelbase is priced at \$2,950 and with a wheelbase of 138 in. at \$3,075. The new 5-ton heavy duty truck with a 120-in. wheelbase is listed at \$3,950 and with a 156-in. wheelbase at \$4,100.

## GARFORD PRICES REDUCED

ELYRIA, OHIO, Dec. 12—The Garford Motor Truck Co. has reduced prices on its entire line of trucks, the cuts ranging from \$100 to \$340. The 1½-ton chassis at \$1,990 is \$100 under previous price and the 2-ton chassis is reduced \$340 from \$3,190 to \$2,750.

## Bureau of Civil Aviation Proposed

### Automobile Industry Approves Bills Introduced in Both Houses of Congress

WASHINGTON, Dec. 12—Two bills have been introduced in Congress, one by Senator Wadsworth of New York, and the other by Representative Hicks of New York to create a Bureau of Civil Aviation in the Department of Commerce to encourage and regulate the operation of civil aircraft in interstate and foreign commerce, and for other purposes.

The bills are practically the same and have the approval of members of the automotive industry interested in aviation, engineers and others, including the National Advisory Committee on Aeronautics, the Bureau of Aviation of the Navy, and the Army Air Service. These measures were drafted in accordance with the recommendations of the President in his message to Congress for the creation of such an establishment. Similar bills were introduced at the extraordinary session of Congress last summer.

These legislative measures provide for the establishment of the bureau with a commissioner of civil aviation as head, who will receive a salary of \$7,500 per annum. The bureau will be charged with the responsibility of fostering civil aviation in every way possible and of co-operating with the industry and governmental agencies.

#### Provisions of Measures

The measure provides that it shall be the duty of the bureau

- (a) To inspect the design and construction and, if approved, to license the operation of civil aircraft, in order to safeguard life and property.
- (b) To regulate the navigation and operation of civil aircraft through the establishment of aerial traffic rules and regulations, in order to safeguard life and property.
- (c) To designate, approve, and lay out air routes.
- (d) To establish and encourage the establishment of landing fields and air stations.
- (e) To make recommendations to the Weather Bureau as to the necessary meteorological service.
- (f) To study the possibilities for the development of civil aviation in the United States, and to collect and disseminate information in relation thereto.
- (g) To investigate, record and make public the causes of accidents in civil aviation.
- (h) To exchange with foreign Governments, through existing commercial attachés, information pertaining to civil aviation.
- (i) To operate such aircraft as the Secretary of Commerce may deem necessary for inspecting, licensing, regulating, and controlling the operation of civil aircraft, and the establishment of air routes, landing fields, and air stations.
- (j) To prescribe the manner of using air routes and to utilize air navigation facilities and appurtenances.
- (k) To prepare and maintain a compre-

hensive survey and inventory of all industrial and civil aeronautical resources under the jurisdiction of the United States.

SEC. 4. That, subject to the approval of the Secretary of Commerce, and for the purpose of making effective the provisions of this Act, the Commissioner of Civil Aviation shall by regulation provide for—

- (a) Licensing pilots and such other persons engaged in the navigation or operation of civil aircraft as may be required for the public safety, and upon good cause the suspension or revocation of such licenses.
- (b) The registration, identification, inspection, certification, or licensing of all civil aircraft, and upon good cause the suspension or revocation of such licenses.
- (c) The registration, identification, inspection, certification, or licensing of all civil landing fields or air stations, and upon good cause the suspension or revocation of such licenses.
- (d) The conditions under which civil aircraft may be used for carrying and transporting persons or property or for the operation of any civil aerial service whatsoever and the licensing of any such service.
- (e) The prohibition of the navigation of civil aircraft over such areas as may be specified for military, naval, postal, or other purposes, either temporarily or permanently, and either absolutely or subject to such exemptions or conditions as may be prescribed.

### Aeronautical Committee Makes Recommendations

WASHINGTON, Dec. 12—Recommendations for Government development and regulation of aviation are contained in the annual report of the National Advisory Committee for Aeronautics, in which it is observed that if there were transcontinental airways, equipped with landing fields, airdromes and meteorological stations, private enterprise would soon see to the establishment of passenger and freight services. It is added, however, that "the first national airways should be carefully planned to serve military as well as civil needs."

Aviation, in the committee's opinion, should be under the direction of a special bureau in the Department of Commerce, which should both control and foster its development.

One of the points to which special importance is attached is the supply of helium. The sources of this supply are limited, but the United States has a practical monopoly of them. As yet, however, the storage of helium in large quantities presents considerable technical difficulties, and the gas is said to be escaping into the atmosphere at a rate sufficient to fill four large airships weekly. The committee accordingly recommends that the Government acquire and seal the best helium producing fields until the experiments now going on for the development of helium-using airships have progressed further.

#### OHIO TO HOLD COURSES

COLUMBUS, Dec. 12—Practical courses in the operation of tractors and gasoline engines, under the auspices of the Ohio Department of Education will be given in many sections of the State.

### BANK CREDITS

*Written exclusively for AUTOMOTIVE INDUSTRIES by the Guaranty Trust Co., second largest bank in America.*

During the past week a slight stiffening in the rates for call money was shown. The quotations ranged from 4½ per cent to six per cent as compared with 4½ per cent to 5½ per cent for the previous week. There was little change, however, in the rates quoted for fixed date maturities from sixty days to six months, quotations ranging from 5 per cent to 5½ per cent as against a fixed rate of 5 per cent in the previous week. Prime commercial paper remained unchanged at 5 per cent to 5½ per cent. In general, trading was dull with no special features, and the volume of business transacted was light.

The Federal Reserve statement as of Dec. 7, 1921, showed a further increase in the total reserve ratio from 72.7 per cent to 73.1 per cent. Inter-Reserve Bank borrowing is rapidly being eliminated, according to the last statement, which shows rediscounts of only \$6,175,000 held by the Boston bank and chargeable against the Dallas and Atlanta institutions. The Richmond bank has settled its entire indebtedness to the other banks. A year ago these three Southern banks owed over \$82,000,000.

The total reserves of the New York institution decreased \$37,458,000, while total bills on hand increased \$32,087,000. Total earning assets showed an increase of \$29,186,000, and Federal Reserve notes in circulation \$10,126,000. The ratio of total reserves to deposit and Federal Reserve note liabilities combined decreased from 83.6 per cent to 81.6 per cent, while the ratio of gold reserves to Federal Reserve notes in circulation, after setting aside 35 per cent against deposit liabilities, decreased from 137.5 per cent to 130.7 per cent.

One of the most noteworthy features in the week's financial markets was the further strength and continued activity of bonds, with a strong demand for both old and new securities. During the week, Victory 4½'s sold above par.

On Dec. 12, the Department of Commerce announced the United States foreign trade figures for November. The value of exports during November, 1921, totaled \$295,500,000 as compared with \$343,597,000 in the preceding month and \$676,528,000 in November, 1920, while imports for the month of November amounted to \$211,300,000 as compared with \$188,080,000 in October and \$321,209,000 in November, 1920. Exports have not been so small since August, 1915, when the total amounted to \$260,609,995.

This gradual reduction in the excess of exports through a steady increase in imports, together with the improved favorable trade balance in British foreign trade, may be one of the fundamental reasons for the marked advance in sterling exchange, which on Dec. 12, at \$4.24½, demand quotation, set a high level for the year and the highest since the last week of September, 1919.

## INDUSTRIAL NOTES

Rauch & Lang, Inc., has increased its production output of electric cars. H. H. Doering, general sales manager, has returned from an extensive trip through the West, during which he established a number of new agencies and put those previously established on a more active basis. He reports Pacific coast prospects as particularly encouraging. The company has recently made some large sized shipments to Pasadena and other coast points, and is also doing a good business in the Chicago and Washington, D. C., districts. Its new models will be ready soon after the first of the year.

Western Reserve Mills Co. of Georgia, manufacturer of automobile tire fabrics, has completed development work at its large plant at Quitman, Ga., and started operations early in December. The plant is owned by the Mason Tire & Rubber Co., being acquired recently by outright purchase and the fabric manufactured will be used entirely in Mason tires. About \$85,000 worth of new machinery was installed in the plant. The same company also acquired by purchase a textile plant at Millen, Ga., which will be used for the manufacture of tire fabric.

Huntington Automotive Co. has been formed to take over the Borland piston works, of Huntington, Ind., near Fort Wayne. The new concern will manufacture automobile parts and accessories. The company has a capital stock of \$100,000 and the directors are as follows: Harry L. Slack, Fort Wayne; Jacob B. Neff, Milford; Henry M. Myers, Huntington; William S. Gordon, Converse; George Sever, Columbia City; J. Archie Borland, Huntington; John Betz, Huntington; Perry Miller, Roanoke and Ora and Wilber Highley, Converse.

Inner-Guard Tube & Rubber Co., organized in St. Louis to manufacture and market an inner tube with special puncture resisting qualities, has opened offices in the Bank of Commerce Building that city as a preliminary to locating a factory. Louis Goodhart is president of the company. The other officers are Paul Van Tuyl, vice-president. John H. Heltman, secretary and John S. Hatz, treasurer. The directors are Lew Burnham, R. C. Hinds, Walter Heintz, L. H. Boyd and Charles R. Rawlin.

B. J. S. Products Corp., New York, has elected new officers as follows: President, John C. Baker, consulting chemist of Wallace & Tiernan, Belleville, N. J.; vice-president, S. S. Parsons, Philadelphia; secretary-treasurer, Francis J. Tietz, New York. The corporation reports that it has made considerable strides in obtaining important new business in the last 60 days, and states that production is steadily increasing under new sales direction.

Kelly-Springfield Tire Co. officials announce that all employees at the Cumberland, Md., plant who were given a furlough Nov. 11, will be taken back gradually and the plant which has been operating four days a week will be put on a full time basis. Improved business conditions are stated to be responsible for the resumption.

W. A. Thompson, president of the Crisp County Lumber Co., of Cordele, Ga., heads a new company formed in that city to establish a plant for the manufacture of automobile storage batteries. The main unit is under construction and will be completed in time to start operations by the first of the year.

Miller Rubber Co. has opened a factory branch in St. Louis to handle the wholesale or dealer business on Miller tires, tubes and rubber goods in the St. Louis district. The Fishell Tire Service Co. will continue to retail and give service on the tires in the city. The manager of the branch is G. K. Meeks.

Mueller Electric Co., Cleveland, has disposed of that part of its business under which it acted as manufacturer's agent to J. Ellis Black, a former employee. The sale was deemed advisable in view of the growth of the manufacturing end of the company.

Authorized Motor Parts Corp., incorporated in Missouri has opened a service station in St. Louis for the Continental motors, Spicer propeller shafts and universal joints, Borg and Beck clutches and parts and Timken commercial axles.

Earl Philadelphia Motor Car Co. has been appointed distributor in the Philadelphia district for Earl motor cars. John C. Baggott is president; R. M. McCormick, vice-president and John R. Thomas, secretary and treasurer.

Chadick, DeLamater Corp., authorized distributor for Continental Motors parts, has signed a contract with the Warner Gear Co. of Muncie, Ind. to represent it for service parts in the New York Metropolitan territory.

London Motor Plow Co. is making plans for the removal of its plant from London, Ohio, to Springfield. E. H. Daniels, the inventor of the plow, is backed by Columbus and Springfield interests, it is understood.

Springfield Coach Works, Springfield, Mass., plans an early enlargement of its factory. Orders for bodies for the Rolls-Royce, Lincoln, Mercer and Cadillac companies have kept the concern busy at production.

Buda Engine Service Co., St. Louis, has been appointed by the Buda Engine Co., Harvey, Ill., its official representative and authorized parts distributor in Eastern Missouri and Southern Illinois.

American Southern Motors Corp. has secured an amendment to its charter changing its name to the Irving Automobile Co. This company manufactures the Vaughan car, custom built.

Lorenz Bros. has been appointed Franklin distributor in Eaton, Ingham, Shiawassee and Clinton counties, Michigan, with headquarters in Lansing.

Mutual Truck Co. plant, Sullivan, Ind., will be offered at public sale by the receiver on Dec. 22.

European Race Drivers  
Coming to Indianapolis

PARIS, Nov. 28 (*By Mail*)—Victor Hemery, Albert Guyot, Louis Wagner and Pietro Bordino are among the European veteran race drivers who may be expected to take part in the 500-mile race at Indianapolis. Hemery and Guyot are members of the French Roland-Pilain team and are now assisting in the production of a set of 122-cubic inch cars which have been entered for the French Grand Prix race. Five cars are being built, two of them being intended for Indianapolis and the three others being reserved for the French classic.

Louis Wagner and Pietro Bordino are negotiating with the Fiat Co. of Turin to send two of their eight-in-line, 183-cubic inch racing mounts to Indianapolis.

## FINANCIAL NOTES

Durant Corp. is offering a limited number of shares of common stock of the Continental Motors Corp. at \$6 a share. Terms of payment are \$2 a share with application and \$2 on the fifteenth of each month thereafter until the contract is completed. No subscriptions will be accepted from any one individual for less than five or more than 20 shares.

General Jobbing Co. creditors, Davenport, Iowa, to the number of twenty, have filed suits against the company to collect more than \$7,000 on notes. The securities were issued a year ago at the time of the reorganization. Charles B. Kaufman and Charles C. Kaufman are co-defendants in the suit. The company was formerly the Mid-West Motors Corp.

H. H. Franklin Mfg. Co. announces that its preferred stock will be withdrawn from sale on Dec. 17. Company officials state that since the stock was first placed on sale, Oct. 6, 1919, preferred and common stock to the amount of \$6,289,425 has been sold direct to the public up to Dec. 1 of this year.

Zenith Tire & Rubber Co.'s affairs will be thoroughly investigated by the Federal court at Toledo. Application for a receiver has been made but before definite action is taken the court will require that all books be brought before it and officers testify as to conditions.

Portage Rubber Co., has been incorporated with an authorized capital of \$1,500,000 to manufacture casings and tubes. The incorporators are Francis Selberling, Robert Guinther, J. B. Huber, R. L. Brannan and C. E. Hamlen.

Preston Motors Corp., Birmingham, Ala., a Delaware corporation, has filed with the Georgia Securities Commission an application to sell \$250,000 of its preferred capital stock in Georgia, authorized capitalization \$10,000,000.

International Motor Truck Co. declared the regular quarterly dividends of \$1.75 on the first and second preferred stocks, both payable Jan. 1 to stock of record Dec. 20.

Hupp Motor Corp. declared its regular quarterly dividend of 1% on preferred stock, payable Jan. 1 to stock of record Dec. 20.

Reo Motor Car Co. has declared a regular quarterly dividend of 2% on its capital stock, payable Jan. 2 to stock of record Dec. 15.

Pioneer French Aviator  
Leblanc, Dies in Paris

PARIS, Nov. 27 (*By Mail*)—Alfred Leblanc, pioneer aviator, and general manager of the Bleriot Aviation Co., died here this week at the age of 52. Leblanc, who was a spherical balloon enthusiast and established a world's distance record in 1907, was one of the first men in France to take up flying.

## CADILLAC GIVES SILVER FOBS

DETROIT, Dec. 14—Cadillac employees numbering 270 were given silver watch fobs at a dinner Monday night in token of their having completed five years continuous service with the company. There are now 1174 five year men.

## MEN OF THE INDUSTRY

William H. Klett, for the last three years connected with the John N. Willys Export Corp. has severed his connection with the corporation to become manager of the automobile department of Mohler y De Gresa Sucs., South American distributor for the Overland, Willys-Knight, Chalmers and Cadillac cars in the City of Mexico. Klett has been representing the export corporation in Mexico and Cuba with headquarters in the City of Mexico for the last two years. Prior to that he was identified with the Carhart Motor Co. of Oklahoma City, and, later as sales manager for the Overland Springfield Motor Co. at Springfield, Mo.

John Yoke has been named as commercial manager of the Handley-Knight Co. of Kalamazoo. Yoke was formerly connected with the wagon end of the Studebaker Co. and left that branch in 1910 to become connected with the newly created automobile division. In 1913 he became associated with Maxwell, first as special representative and later as sales manager. He joined the Willys-Overland organization in 1916 and until now has had charge of branch sales activities in Toledo.

G. B. Sharpe for the past fifteen years identified with the farm machinery industry, has been appointed advertising manager of The Burroughs Adding Machine Co. For the last two and a half years Sharpe has been assistant general sales manager of the Cleveland Tractor Co. Previous to going to Cleveland, Sharpe was with the De Laval Separator Co. in New York for nearly ten years and, before then was advertising manager for Studebaker Corp. for four years.

L. C. Alexander has been appointed manager of the Western Ohio territory with headquarters in Columbus for the Eclipse Mfg. Co., manufacturer of the Hercules spark plug. Alexander was formerly Cincinnati branch manager of the Goodyear Tire & Rubber Co., has been connected with the Firestone Tire & Rubber Co. handling national accounts and has been factory district representative of the Pierce-Arrow Motor Car Co.

P. T. Irvin, formerly manager of the drill division of the Greenfield Tap and Die Corp., Greenfield, Mass., has been placed in charge of the recently consolidated small tool and drill division of the corporation. For the past three years Irvin has been sales manager of the Lincoln Twist Drill Co. and prior to that was sales manager of Wells Bros. Co. of Greenfield.

George H. Layng has resigned as vice-president and manager of manufacturing of the Cadillac Motor Car Co. to accept the same offices and responsibilities with the Peerless Motor Car Co. Layng's service with Cadillac extended over a period of nearly 16 years. He joined the organization in 1905 as foreman of the chassis department, making single-cylinder cars.

Peter Brown and Bernard R. Banks, manager of the motor department of Brown Brothers, Ltd., motor and cycle accessories firm in London, England, will be at the Belmont hotel, New York City, from Dec. 27. Their purpose in coming at this time is to visit the national automobile show in New York.

R. B. Kayser, formerly assistant sales manager of the Chevrolet Motor Co., located at the general offices, has resigned to accept a similar appointment with the Durant Motor Car Co. of New York. Kayser has been associated with the Chevrolet organization for the last eight years.

Morris Jones, who has been with the tractor division of the Ford Motor Co. at the Dearborn and Highland Park plants, has organized with John R. Weaver the firm of Morris Jones, Inc., which will be an additional Ford and Fordson dealer in Philadelphia in the Overbrook district.

Julian M. Case, for the past few years identified with Scripps-Booth, United Motors Co. and the Garford Motor Truck Co. as advertising manager, has joined the Fred. M. Randall Co., advertising agency in Detroit, as vice-president in charge of sales and merchandising.

L. R. Clare, formerly connected with the Hudson Motor Car Co. and industrial engineer of Chicago and San Francisco, has become connected with the Leach Biltwell Motor Car Co. Clare will have supervision of the personnel at the factory of the Leach company.

L. B. Southerland has been appointed general manager of the Chicago branch of the Cadillac Motor Car Co., and C. A. Englebeck has been promoted to branch sales manager succeeding him. L. B. Dimond has been named assistant sales manager.

Bertram A. Doran, formerly assistant branch manager in the Orient for General Motors Export Corp. has been appointed special representative of the export department of Maxwell-Chalmers in the Far East.

W. J. Shay, for the last seven years associated with the Champion Spark Plug Co. of Toledo, has been appointed sales manager of the automotive division of the Columbus McKinnon Chain Co.

L. M. Bradley, former general manager of the Motor & Accessory Manufacturers Association, has joined the organization of the C. G. Spring Co., Kalamazoo, Mich.

## American Turn-Auto Co. Obtains Patent Rights

COLUMBUS, Dec. 14—The American Turn-Auto Co., which was chartered under Ohio laws but later formed into a partnership consisting of Howard M. Bettett and R. C. Penfield, the latter of Bucyrus, has taken over the American rights and patents formerly held by the Turn-Auto Co. of Columbus, manufacturer of a device to turn an automobile over on its side while making repairs.

The office is located at 40 West Gay Street and the device is being manufactured by the Hatfield, Penfield Steel Co. of Bucyrus under contract. The Turn-Auto Co. does not go out of existence as that concern owns foreign rights to the device.

## SLIGHT INCREASE IN DALLAS

DALLAS, Dec. 14—The automobile business during the first 15 days of the last month of the year was said by retailers here to be about as good as that of any 15 days of the year. There had been increases in sales, as applied to both new and used cars, during the past few weeks by most of the dealers of Dallas and north Texas. The actual retail sales for the first 15 days of December showed a slight increase of a similar period for November. Dealers said some of the business was holiday trade,

## METAL MARKETS

Activity in the metal markets, so far as business for immediate delivery is concerned, has dwindled to negligible proportions. Consumers are averse to taking on a single pound of metal which they do not need for immediate operating schedules, all wanting to keep raw material inventories as low as possible. A somewhat different viewpoint characterizes the situation with reference to first quarter 1922 requirements.

Pig iron consumers have begun to place contracts so as to be covered, at least in part, for the first three months of the coming year and, while automotive foundries have not been very prominent in the market so far, negotiations are now pending in many instances with a view to providing adequate iron for the first three months' melt of 1922. The outlook as to pig iron prices, largely wrapped up as it is in the shaping of freight rates, is one thing and the extent of the supply quite another.

The blast furnaces now in operation have been able to dispose of their output as the result of the routine demand of the last few months and the placing of a fairly satisfactory quota of orders for first quarter 1922 deliveries implies the going into blast of a number of furnaces that had been idle during the better part of the year. Obvious it is that the pig iron producers are playing close to the cushion in the matter of supply and that they will not permit any excess of stocks over the demand to bear down on values, regardless of what other factors may contribute toward a further downward readjustment of prices.

On the surface the steel market, as is usually the case immediately preceding the holiday season, has gone to sleep. Far-seeing buyers, however, are making good use of the present by attending to the preliminaries of the actual placing of orders. They are sounding the market in a cautious way and, while they are withholding the signature on the dotted line for the time being, they are prepared to reap the benefits that come from being the early bird in a buying movement.

Both steel producers and consumers have come to the conclusion that the one factor which continues to retard the return to completely normal conditions is the continuation of unnaturally high freight rates and the producers are agreed with the public carriers that these rates can not be pared adequately except through further wage cuts.

Pig Iron.—Automotive interests are for the most part deferring the placing of representative orders for first quarter 1922 shipment, foundries being generally supplied with enough iron to carry them beyond the middle of next month. The market is rather steady than strong.

Steel.—Prices remain generally unchanged with the demand seasonably restricted. So far not enough representative 1922 business has been placed to afford a clear picture of the trend of values.

Aluminum.—Rumors are afloat that heavy tonnages of virgin ingots held by Detroit interests are being pressed on the market at sacrifice prices, but it is impossible to verify these reports. The sale of 350,000 lbs. of aluminum castings (now at the International Motors Co. plant in Long Island City) by the Government is also a somewhat depressing market factor. Sheets are in fair demand but sellers and buyers are hard to get together on prices.

Copper.—The market has turned quiet and easier.

# Calendar

## SHOWS

Jan. 7-12—New York, National Automobile Show, Grand Central Palace. Auspices of N.A.C.C.

Jan. 9-14—New York, Motor Car Body Exposition, Automobile Body Builders Association, Twelfth Regiment Armory.

Jan. 28-Feb. 4—Chicago, Automobile Salon, Hotel Drake.

Jan. 28-Feb. 4—Chicago, National Automobile Show, Coliseum, Auspices of N.A.C.C.

Feb. 6 to 11—Seventh National Tractor Show and Educational Exposition, Minnesota State Fair Grounds, Minneapolis.

Feb. 6 to 11—Winnipeg, Can., Automotive Equipment Show, Western Canadian Automotive Association.

## FOREIGN SHOWS

March, 1922—Santiago, Chili, Annual Automobile Show.

April 16—Mexico City, Annual Automobile Show, Auspices of the Automotive Division of the American Chamber of Commerce.

April 22-May 1—Prague, Czechoslovakia, Fourteenth International Automobile Exhibit.

May, 1922—Quito, Ecuador, Agricultural Exposition, celebrating Centenary of Ecuador. Automotive Section.

Sept. 1922—Rio de Janeiro, Brazil, Automobile exhib-

its in connection with the Brazilian Centenary Association Automobillista Brasileira.

## CONVENTIONS

Dec. 20—Philadelphia, American Society of Mechanical Engineers.

Dec. 27-29—Chicago, American Society of Agricultural Engineers, Auditorium Hotel.

Jan. 17-20, 1922—Chicago, American Road Builders Association.

Jan. 30-31—Chicago, Fifth Annual Convention, N. A. D. A., La Salle Hotel.

Jan. 30-Feb. 2—Boston, Sixth Annual Conference of the International Delivery

Association, Copley Plaza Hotel.

June 11-15—Milwaukee, Annual International Convention of the Associated Advertising Clubs of the World.

Sept. 18-23, 1922—Rome, Italy, Second Annual Meeting of the International Chamber of Commerce.

## S. A. E. MEETINGS

Detroit, Dec. 23, Feb. 24, Mar 24, April 25, May 26.

New York, Jan. 10-13, 1922—Annual Meeting.

Chicago, Feb. 1

Minneapolis, Feb. 8-9—Annual Tractor Meeting.

## Appraise Lincoln Physical Property

### Receiver Has Detroit Figures—Work on Eastern Holdings Not Completed

DETROIT, Dec. 14—Whether Lincoln Motor Co. is to be reorganized and continue the manufacture of motor cars or is to undergo dissolution, will depend largely upon the outcome of the hearing for the cancellation of the \$4,500,000 supplementary Federal tax assessed by the Treasury Department, which will be moved this week by the Detroit Trust Co., Lincoln receiver.

The attitude of the men who have the disposition of Lincoln in hand will be guided to a large extent by the outcome. Should the taxes be waived, or reduced to a figure compatible with the power of the company to pay, reorganization is confidently looked for.

**Creditors Meet Dec. 28**

The appraisal of the physical properties in Detroit has been completed and the figures are in the hands of the receiver. These will be filed in Federal court here and presented in support of the tax appeal at Washington. The filing has been delayed pending the completion of appraisals by ancillary receivers in the East, where the company has properties aggregating several hundred thousand dollars.

A creditors' meeting has been formally fixed for Dec. 28, by which time it is expected determination will be made on the tax claims. The company's financial condition as of Nov. 8 will be presented and definite action decided upon.

Sales of cars at the plant are continuing at the rate of three a day.

## CZECHO-SLOVAKIA ACTIVE

NEW YORK, Dec. 12—A communication from the Automobile Club of Czechoslovakia with headquarters at Prague indicates that there is considerable automotive activity in that country. The 14th international automobile exhibition will be held at Prague, April 22 to May 1.

## New Tariff Regulations Cover Canadian Shipments

WASHINGTON, Dec. 12—Federal authorities have called upon postmasters throughout the country to notify shippers that amendments to the Canadian tariff laws effective Dec. 31, should be noted. The regulations apply to freight, express and parcel post shipments.

The regulations apply to "all goods imported into Canada capable of being marked, stamped, branded, or labeled, without injury, shall be marked, stamped, branded, or labeled in legible English or French words, in a conspicuous place that shall not be covered or obscured by any subsequent attachments or arrangements, so as to indicate the country of origin. The stamping, branding, or labelling shall be as nearly indelible and permanent as the nature of the goods will permit."

## NEW REO TAXI CHASSIS

DETROIT, Dec. 15—The Reo Motor Car Co. has developed a special taxi chassis which will be shown for the first time in the New York Reo branch the week of the New York show. The model is designed to meet the rough use to which a taxicab is subjected, with special attention to acceleration and brakes. The model is the design of H. T. Thomas, Reo engineer.

## CHIEF READY FOR BIG OUTPUT

PORT HURON, MICH., Dec. 15—The Chief Motors Corp., which manufactures engines for the Whitney Tractor Co. at Upper Sandusky, Ohio, has completed the installation of machinery for the production of 500 engines a month. About 100 will be built in January and the organization will be expanded to take care of the larger production after Feb. 1.

## ASK NEW GARY RECEIVER

INDIANAPOLIS, Dec. 15—Creditors of the Gary Motor Truck Co. appeared in Federal Court here to-day and asked for the appointment of a new receiver. Creditors of the company are said to be interested in a reorganization plan under which it is proposed to provide \$150,000 new capital.

## Conferences Held on Truck Loading

### Connecticut Officials to Co-operate With Industry in Wiping Out Evil

HARTFORD, Dec. 13—Representatives of the National Motor Vehicle Conference Committee conferred here yesterday with Motor Vehicle Commissioner Stoeckl on the State law designed to prevent the over-loading of motor trucks. It was made clear to them that the State officials would co-operate to the fullest extent with the automotive industry in its efforts to wipe out the over-loading evil.

### Ruling Led to Meeting

The conference was the direct result of the ruling by the Connecticut authorities that trucks will be permitted to carry more than their rated load whenever their makers will certify that their operation will be entirely safe with the heavier load. This ruling was made at the earnest request of truck operators, but it was opposed by the National Motor Vehicle Conference Committee, which was represented at the conference by D. C. Fenner, its chairman, and F. W. Fenn, secretary of the National Automobile Chamber of Commerce. They do not believe trucks should carry more than their rated load.

### Maker's Word Accepted

It was explained by Stoeckl that if a manufacturer gave formal notice that a 3½-ton truck could safely carry a 5-ton load, the vehicle would be re-rated as of 5 ton capacity and would be taxed accordingly.

The Connecticut authorities contend that not only do over-loaded trucks seriously damage State highways, but also that they are a prolific cause of traffic accidents. It is asserted that the number of highway mishaps has decreased appreciably since rigid regulations against over-loading were adopted in that State.

**Simple, durable, economical—the LYCOMING Motor gives manufacturer and buyer alike what they most want in the engine**

The Lycoming Motor has just enough extra piston displacement to assure the manufacturer that the car he equips with this remarkable motor will have an ample reserve power to meet the buyer's demands.

At the same time, the Lycoming Motor, because of its simplicity and the great care concentrated in its design and workmanship, is extremely economical both in operation and maintenance. In every respect, it fits into the needs and requirements of both manufacturer and buyer.

Write for detailed description to assure yourself of the advantages of this exceptional motor.

## FEDERAL BEARINGS

### UNIFORMITY

The Babbitt lining in every Federal Bearing shows the same tough, fine-grained, homogeneous structure because every Bearing is chilled immediately after it is lined.

### SOLIDITY

Every Federal Bearing is guaranteed absolutely free from porosity, because the process of manufacturing makes it impossible for the Babbitt to contain air while cooling.

### 100% BOND

Unlike all other methods of manufacturing Bearings, the Babbitt lining and Bronze Back of every Federal Bearing is Bonded UNDER PRESSURE while the adhering alloy is at a constant temperature.

### EXCELLENCE

Every Federal Bearing is manufactured from the highest grade materials, machined accurately and subjected to the most rigid inspection, because "FEDERAL, DETROIT" must be stamped on the back.

EVERY FEDERAL BEARING IS LINED BY

## The AUTOMOBILE

VOL. XLV.

NEW YORK—THURSDAY, DECEMBER 22, 1921

No. 25

## 94% of Sales Will Be of Cars Selling Under \$2,000

Statistics given here will aid the executive to plan production and sales effort according to possibilities of his particular market. Price class sales are analyzed. "Over \$3,000" group comprises 2% of total.

By Norman G. Shidle

Charts and Statistics by Raymond B. Prescott

**P**RODUCTION and sales plans made on the basis of accurate data will save thousands of dollars to automotive concerns. In this second article of a series presenting specific information for this purpose, the first step can be taken in segregating the general statistical data into its component parts so that the particular car may be considered as related to its price group.

These results are of vital importance to every car manufacturer, both those who have been in the field for many years and those who have entered the business more recently. Successful operation, especially during the business period which we are entering depends upon a proper relation between manufacturing capacity, sales cost, overhead expenses and market possibilities. Production plans must be based upon facts and upon accurate market analysis, in so far as possible, rather than upon hopes and inspiration.

The first article, published Nov. 17, presented figures showing the probable growth of the passenger car industry during the next five years as regards both sales and production and pointed out how these figures could be utilized in planning. That article dealt with the passenger-car industry as a whole. It

was shown that the industry was in sound condition, that a return to normal might be expected within two or three years, and that an excellent market for passenger cars in general is available in the immediate as well as the more remote future.

The individual manufacturer, however, needs more detailed data upon which to lay more detailed plans. Only in a very general sense can every passenger car be said to compete in sales with every other passenger car. Competition is largely confined to cars in the same price class. Thus in making output plans, the individual manufacturer is concerned chiefly with the market available for cars of his price group.

The figures shown in the accompanying table indicate the percentage of total production or sales for the year in five major price classes. Actual production figures are also included, but the material can best be discussed as regards percentages. The limits of the price groups have been made broad enough so that a year-to-year comparison of percentages is affected only slightly by the changing of cars from one price group to another. Ford, for instance, with its immense production, has always been in the "Under \$1000" group despite numerous price fluctuations since 1905. This is true of most other cars as related

to their specific price group, although the movement of Dodge in 1919 and 1920 from the "Under \$1,000" group in the \$1,000 to \$2,000 group affects the figures for those years. The percentages in the \$3,000-\$4,000 and "Over \$4,000" groups have been considerably affected, however, during the last few years by the changing from one group to the other of the Cadillac, which has, of course, a relatively large production for a car of this price class.

These particular instances, however, are the chief ones in which the percentages are affected in that way. Consequently, it is feasible to compare the percentages of one year with those of another.

From 1905 to 1910 the cars in the \$1,000-\$2,000 class predominated; that is, they formed a larger percentage of the total cars sold during each of these years than any other price group. This marked the early part of the commercial development of the industry, but preceded the real growth of Ford sales. The figures for this period are interesting rather as history than as factors in present calculations, since they cover the period before the automobile had really taken its place as a definite factor in American transportation and social life.

In 1912 the cars selling for less than \$1,000 first took the predominant place in volume sales which they have held ever since. For the practical purposes of determining markets at the present time, the figures from 1912 to 1920 are the most valuable. Studying these figures alone, certain significant facts stand out.

1. Cars selling for less than \$1,000 have comprised more than 60 per cent of total sales in every year.
2. Cars priced between \$1,000 and \$2,000 have never been less than 14 per cent nor more than 30 per cent of the total sales of any given year.
3. Cars priced between \$2,000 and \$3,000 have varied from 2 per cent to 5 per cent of the total sales of any given year.
4. Cars priced between \$3,000 and \$4,000 have varied between 0.4 per cent and 2.2 per cent of the total sales for any given year.
5. Cars selling for more than \$4,000 have varied between 0.3 per cent and 3.8 per cent of the total sales for any given year.

Granting that the figures from the years 1912-1920 are those most useful in making plans at present, they may be summarized in another way to bring out clearly certain trends. Taking total sales for these nine years, the percentage of cars sold in each price class as related to total sales during this period is approximately as follows:

Under \$1,000	.....70%
\$1,000-\$2,000	.....24%
\$2,000-\$3,000	..... 4%
\$3,000-\$4,000	..... 1%
Over \$4,000	..... 1%

These averages should be considered in relation to the list showing the limits of variation in each class. Viewed in this way, it becomes apparent that the averages may properly be considered as indicative of a general and permanent trend. This is true because the fluctuations from year to year are comparatively slight. The chart shown in Fig. 1 illustrates this graphically.

This chart shows the yearly per cent of variation in each price class from the average for the years 1912 to 1920 inclusive. The widest fluctuation is shown in the "Under \$1,000" class, but this maximum is only about 4 per cent. During the years 1914, 1915 and 1918 there was very little fluctuation in any class. This is significant, since these years were nearer to being normal commercial years than any other included in the period.

It is significant, too, that the percentage of total production included in any one price group appears to vary directly in relation to the average wholesale price of all cars produced. Thus the following table shows that in 1912, 1913 the average price of all the passenger cars produced was about \$900, and that in 1919 and 1920 it was approximately the same. A glance at the percentage of cars produced in the various price classes shows that there is practically no variation for these four years. Approximately the same thing is true of the two intervening years, 1916 and 1917, during which the average price was about the same. Thus

on the basis of past records the law may be tentatively laid down that the percentage of cars produced in a given class will vary directly with the average price of all cars produced.

It is interesting to see how this will work out for the year 1921, the comparison being made on the basis of production figures for the first three quarters. The average wholesale price of all cars produced during those first three quarters of 1921 was approximately \$700. Now we may forget, for the moment, the actual production figures and attempt to determine, simply with the average wholesale price as a

basis, what percentage of cars have been produced in each of the various price classes. This can be done by applying the tentative law just outlined. On this basis of determined average wholesale price, the following results are obtained as regards the distribution of 1921 production to the various price groups.

Under \$1,000	\$1,000-\$2,000	\$2,000-\$3,000	\$3,000-\$4,000	Over \$4,000
75%	19%	4%	1%	1%

But it is possible to check the operation of this law in this case, since actual production figures for these first three-quarters of 1921 are available.

Segregating, then, the actual production figures for the first three-quarters of 1921 into price groups, and comparing them with the calculated percentages determined, we get the following:

	Under \$1,000	\$1,000-\$2,000	\$2,000-\$3,000	\$3,000-\$4,000	Over \$4,000
Calculated	75%	19%	4%	1%	1%
Actual	73%	21%	4%	1%	1%

The slight variation which is shown by these figures gives additional stability to the theory that the figures given may properly be used as a sound basis upon which to base approximate future predictions.

The conclusion may thus be drawn that something like 70 per cent of passenger car sales in the future will be of cars which sell for less than \$1,000, while about 24 per cent will be in the \$1,000-\$2,000 class.

About 4 per cent of the total sales will probably be of \$2,000-\$3,000 cars, while cars selling for more than \$3,000 will comprise only about 2 per cent of the total.

In the Nov. 17 article general production and registration predictions were made. This article presents the percentage of the total sales which may logically be expected by a given price group. In making plans, the manufacturer should correlate these percentages with

"Over \$4,000" group retrograded steadily from 1912. Its accentuated growth during 1919 and 1920 was due chiefly to the coming into that class of a relatively large production car which had already attained production proportions in a lower price class.

The uniformity of the percentages of the various price classes during the last nine years indicates, as shown, that the percentage of total sales which may be expected

Fig. 1

the total production curve previously given. On this basis, he can determine with a fair degree of accuracy, the number of cars which will probably be produced in any given price class in a given year.

In this connection it is interesting to note the rate of growth of the various price classes as shown in Fig. 2. In constructing this chart the year 1912 has been taken as a basis and rated as 1.00. Then on an index figure basis, the growth of the various price classes from 1912 to 1920 has been drawn.

The curves show that the rate of growth of the low-priced car has been greater than that of any other price class, and that the growth of this lowest price group has been less subject to ups and downs than any other with the possible exception of the \$1,000-\$2,000 group. The

by the various price groups is fairly well fixed within certain limits. The individual manufacturer then can logically expect to increase his market to any material extent only within the limits of his price group. The sale of an individual car can be increased in only three ways:

1. By taking some of the business away from other cars in the same price group.
2. By some other manufacturer in the price group going out of business.
3. By selling to new car buyers, a certain percentage of which are prospects for the given price class car.

No radical or rapid growth in sales can be expected by any individual manufacturer as a result of the first means. It is possible, of course, for a superior product

to make inroads upon the sales of less efficiently made or marketed products. Where these other products are already established, however, they will continue to make many sales simply because of their past momentum. Every manufacturer is attempting to get a larger proportion of his price class market at the same time and the efforts of each one offset to a given extent the efforts of any individual concern, the resistance varying in accordance with the merit of the competing product and the effectiveness of the marketing methods used in selling it.

In other words, material increase in sales volume in one year or two cannot logically be expected from this first source.

Neither can material increase in sales for a given

product be expected from the second source—the retirement from the field of a competitor. In such a case it is reasonable to suppose that all the remaining makers in that price class will absorb a part of their former competitor's sales, probably in proportion to the percentage of entire sales which each competitor previously held.

The third source can be rather accurately calculated on the basis of the figures given in this article and the previous one maintained.

Thus it appears that the data given can properly be used as a basis for production and sales plans by passenger car manufacturers. Economic and human factors affecting the market, correlated with this statistical data, should form a sound foundation upon which to base such plans.

Fig. 2

### Analysis of Passenger Car Sales by Number and Per Cent.

Year	Under \$1,000	\$1,000-\$1,999	\$2,000-\$2,999	\$3,000-\$3,999	\$4,000 and Over	Year	Under \$1,000	\$1,000-\$1,999	\$2,000-\$2,999	\$3,000-\$3,999	\$4,000 and Over
1905	8,023	10,650	1,253	664	941	1914	352,397	128,950	35,480	7,435	5,306

# Italian Manufacturer Reverts to Poppet Valve Engine

Rotary valve abandoned in new 176 cu. in. four-cylinder engine which is said to develop 43 hp. at 2500 r.p.m. Large jacket space, aluminum pistons, tubular connecting rods, four speed gearset are employed. An integral pressed steel housing is used for the axle and propeller shaft.

**P**REVIOUS to the war the Fabbrica Automobili Itala of Italy manufactured a car with a rotary valve engine in which the valves were arranged vertically in pockets at the sides of the twin cylinder castings, the inlet valve on one side and the exhaust valve on the other, each valve serving for two cylinders. This type of engine was manufactured for quite a number of years and seemed to have established the success of the rotary valve. After the war it was reported that the company had ceased manufacturing automobiles, but lately the firm has come out with an entirely new chassis with poppet valve engine, known as the Model 51. This new model has already made its mark in racing, machines of this design having come in first, second and third in the 183 cu. in. class of the Targa Florio race held on the Island of Sicily.

This chassis is made in two lengths of wheelbase, one intended for regular touring bodies and the other, a shorter one for what is known in Europe as a sport type, or what we in this country call a speedster or roadster. In the case of the roadster model some slight changes are made in the engine which tend to increase the power output. As Italian designers have developed a number of distinctive features in automobile design, a description of this latest Italian chassis is likely to be of interest to American technical men.

The engine is a four cylinder one with block-cast cylinders of the L-head type. Bore and stroke are 83 and 130 mm. respectively (3.27x5.12 in.). The cover of the water jacket on the cylinder head is removable and forms the water return manifold. The valve pockets are thoroughly water-jacketed in order to insure efficient cooling of these parts. It will be noticed from the sectional views herewith that the water spaces around the cylinders are very liberal, but there is a common wall between the first and second and between the third and fourth cylinders respectively, which, however, is made of extra thickness.

Aluminum alloy pistons are used, with four piston rings at the upper end, placed two and two in the same ring groove. The piston pin apparently floats in the piston bosses and the top end of the connecting rod, scoring of the cylinder walls being prevented by a snap ring over the ends of the pin. The connecting rods are of the tubular type and are made as light as possible. They are provided with a bronze back, white metal bearings at the

big end and a bushing of drawn bronze at the wrist pin end.

The crankshaft, which is supported by three bronze backed, babbitt lined bearings, carries the flywheel with clutch housing and starter gear ring at the rear end, and the pinion of the helical distribution gearing at the forward end. The driving pulley for the trapezoidal belt of the radiator fan is keyed to the hub of this pinion. The camshaft also is supported in three bearings and actuates the valves through the intermediary of roller type valve tappets which are adjustable as to clearance. A cast aluminum cover plate encloses the valve mechanism.

Side view of Itala model 51 chassis

Keyed to the helically toothed wheel on the camshaft is a helicoidal bronze pinion which operates a transverse shaft to which the magneto is coupled at one end and the water pump at the other.

The crankcase consists of two aluminum castings which are joined together in a horizontal plane through the crankshaft axis. The top half is cast with four supporting arms which are sufficiently long to mount the engine directly on the main frame. On the right of the crankcase is located the oil filler which also serves as crankcase breather, while on the left are mounted the electric generator and the starting motor, the latter being located on the rear supporting arm quite close to the flywheel. A noteworthy feature of the crankcase construction is a sort of apron cast onto the lower half of the case. At the rear end of the crankcase there is a semicircular extension to which is secured a sheet metal pan lying close to the flywheel. The upper edges of the apron are flanged for the attachment of filler plates extending to the lower flanges of the frame side members, thus doing away with the need for an underpan. All accessories on both sides of the engine are exceptionally accessible.

Engine lubrication is by a pressure system, the pressure

(Left)—Front elevation of engine, sectioned to show transverse shaft for auxiliary drive. (Right)—Transverse section of engine

being produced by a sliding vane pump which is fastened to the rear end of the crankcase and driven directly off the camshaft. This pump draws oil from the sump which is separated from the main compartment of the crank chamber by a horizontal, fine-meshed wire screen. It is distributed through an oil tube cast in the upper half of the crankcase from which leads are drilled to all of the main bearings, whence it passes through oil passages in the crank arms and crankpins to the crankpin bearings.

The carbureter is a horizontal type of Itala design embodying the constant level and supplementary air valve principles. Fuel is supplied to the carbureter by the Weymann vacuum feed system. Ignition is by a Marelli magneto with spark control from the steering wheel.

It will be noticed that the engine is of the offset type, the offset being apparently 8 mm. or a little over one-tenth of the bore. It is claimed for the engine that it develops about 50 hp. at 3,000 r.p.m., which is a remarkably high output, especially when it is considered that the engine is of the L-head type which is ordinarily not considered as well adapted to high speeds and large outputs as the overhead valve type.

The clutch is of the dry disk type, the metal disks being faced with Thermoid fabric. It is controlled by means of a pedal which acts on the central spider. The transmission, which affords four forward speeds and one reverse motion, is of the horizontal type. The sliding pinions are mounted on a splined shaft, whereas the gears on the secondary shaft are secured in place by keys and spacers. The high speed is a direct drive and is obtained by means of a positive clutch of the internal and external pinion type, the internal teeth on the second intermediate sliding gear being slid over a projecting portion of the pinion of the constant mesh set. To

the rear end of the third motion shaft is keyed the transmission brake pulley. It will be noted that the shafts, which are mounted on ball bearings, are of very sturdy dimensions, the object in making them comparatively large being to reduce vibration and consequent noisy operation, especially when driving on one of the lower speeds. Attention may be called to the long pilot bearing and to the provision for preventing oil leakage from the gear case. The gearbox is supported by two cross mem-

Longitudinal section of engine

(Left)—Horizontal section of transmission and transmission brake

(Right)—Transverse section through gearbox, showing method of mounting gearshift and brake levers

bers of the frame, the connection between the primary shaft and the clutch shaft being made by a universal joint which also has a sliding motion.

Secured to the rear end of the gearcase are two forks to which the forward end of the propeller shaft tube is hinged. The axis of this pivot joint coincides with the center of the universal joint which connects the splined shaft of the transmission to the propeller shaft. This universal is located inside the transmission brake drum and is of a type well known in this country. With the forward end of the propeller shaft housing pivoted to the transmission case, both torque and driving thrust are naturally taken up on this housing. To the shaft extending from the transmission case is keyed one of the helioidal pinions constituting the driving means for the speedometer.

Change speed and brake lever are mounted on a lateral extension of the gearcase cover plate and on the right

hand frame side member respectively. Both levers are so located that they come inside the body. Mounting the change gear lever on an extension of the gearcase cover has the advantage that it is not cramped by any deformation of the frame, as often occurs when the sector is mounted on the frame.

The rear axle housing is made of pressed steel with the propeller shaft housing made integral. This is a construction which is used particularly in Italy and which gives a strong and rigid rear axle construction of light weight. The central portion of the axle housing is flanged, the two halves being bolted together by the flanges. At both ends the flanges are cut away, a tubular axle extension is inserted into the housing and a brake support and spring saddle is forced over it.

The final drive is by spiral bevel gears, the differential and bevel driving gears being supported in a gear carrier which also forms the rear cover plate of the axle housing. Thus the whole differential and driving gear can be withdrawn from the axle from the rear. To make this possible the pinion shaft is secured to the propeller shaft by means

of a special type of clamping coupling. The axle is of the full floating type and its shafts may be withdrawn without disturbing the differential gear in any way. Driving dogs of

(Above)—Method of connecting torque tube to gearbox

(Right)—Horizontal section through rear axle

Front axle end and front wheel

toothed form are forged integral with the rear axle driving shafts and engage with driving teeth formed on the insides of the wheel hubs.

The rear wheel brakes are compensated and are operated by means of the hand lever, while that on the transmission is operated by a pedal. Both are provided with means of adjustment for wear. All springs are of the semi-elliptic type and are provided with rebound reverse leaves on top of the master leaf to prevent oscillation. The rear springs are practically flat under load and are provided with shackles at both ends, as all torque and thrust come on the propeller shaft housing.

Rudge-Whitworth wire wheels are fitted, for which the advantages are claimed that they are lighter and disperse the heat of the tires better than other types. Steering is by worm and worm wheel, the shafts of both being mounted on ball bearings.

The electrical equipment, aside from the ignition apparatus, is of Westinghouse manufacture. This installation is completed by a 6-volt battery, by searchlights and signal lamps, an electric horn and by the combination lighting and starting switch which is assembled on the instrument board together with the amperemeter. This instrument board, which is of simple and attractive design, in addition to the apparatus already mentioned, carries other instruments such as an oil pressure gage, speedometer and clock. The fuel tank, which is located at the rear end of the frame, has a capacity of 22.5 gal. and is fitted with a gasoline gage.

The piston displacement of this engine is only 2881 cu. cm. (176 cu. in.), yet it has sufficient power to give the car a maximum speed on the level of over 60 m.p.h. The normal output is 43 hp. at 2500 r.p.m. The car is made in two lengths of wheelbase, 116 in. and 128 in. The tread is 55½ in. and the tires carried are 820 x 120 mm., which is about the same as 32 x 4½.

## New "Rut-Proof" Pneumatic Truck Tire

**P**NEUMATIC tires used on the adobe roads in the southwestern states, which roads are deeply rutted at certain periods of the year, are subjected to heavy abrasion on the side walls of the tire. In the northern states the same trouble is encountered, the only difference being that the rutted roads freeze instead of becoming sun-baked.

These conditions have prompted the introduction of a pneumatic truck tire of a design intended to meet them. The Goodyear "Rut-Proof" tire, shown in section herewith, is built up ply by ply on an iron core, each ply being applied under tension. The feature of this tire is the crescent-shaped pads on the side walls of the tire, applied before the tread. The pads are made up of a very tough, yet flexible rubber compound and are so placed as to protect the cord fabric carcass against side-wall abrasion from ruts or cuts from sharp stones, etc. The vital part of the tire—namely, the cord carcass—is thus protected, not only by the tread, but on the total exposed area, by a heavy coating of tough rubber.

Road tests have been made with this tire under the worst conditions. An 8-in. tire mounted on the right rear wheel of a truck was rubbed intermittently against a concrete curb for 450 miles and was run altogether over 9000 miles during this test. We are informed that a regular 8-in. pneumatic, given the same test under exactly the same conditions, stood only two miles of curb

rubbing before the gum was entirely worn off the sidewall.

Tire designed to prevent side wall abrasion

# Reversing Facilities for Use with or on Rail Cars

A description of various devices and equipment which have been used on or in connection with the operation of motor-driven rail cars. Such equipment is often important in the successful use of such vehicles.

By Donald A. Hampson

**I**N the Province of Quebec there is a railroad which uses a motor-driven rail car on a passenger run of 45 miles. This car must be turned eight times a day in making its four round trips. A schedule of 360 miles per day does not allow for much time at terminals.

This rather extreme case emphasizes the importance of a faster reverse than is found in ordinary gearsets and of proper terminal facilities as aids to successful operation of gasoline cars on railroads. A number of installations have been condemned because due consideration was not given to these points in the beginning. Proper housing and filling arrangements, together with some form of faster reverse, will save a great deal of time at the end of a run, resulting in decreased labor costs, less congestion in yards, slower depreciation, more popular schedules and generally more efficient service.

With so few exceptions that they may be disregarded, railroad motor cars are one-direction cars. This means that they have to be reversed (turned) twice per round trip. Not that these same cars cannot be operated in a reverse direction at a high speed with the controls at one end, but standard railroad practice does not encourage this and State laws generally forbid it in regular service. Provision for a maximum of paying space, a considerable increase in cost and mechanical complications combined have precluded the use of double-end construction.

So it is that reversing facilities, which include the transmission of power within the car and the track structures for turning the car, may make or mar the success of such a motive power installation. The two are independent, yet they bear a close relationship.

## Survey of Conditions Necessary

A careful survey of existing facilities, plotted with the proposed motor car service, will show whether the time-honored constructions already in existence for turning locomotives and cars will suffice or whether they must be augmented by some device on or for the car itself. Opposite conditions are often disclosed by such a survey. One general manager computed that he would save but twenty minutes a day on six shuttle trips he was to make—there was a convenient wye at one terminal and a turntable at the other—and, as there was considerable lay-over time, the use of a faster reverse was unnecessary. In another case the wye at one end of the line was so far away that half a mile's running in reverse would be required; physical conditions prohibited any other track layout and so a higher reverse speed was decided on as the logical solution.

Separating the various methods so far in use into road facilities and car units, the former will be treated

first. These are the wye (hereinafter called "Y"), the turntable and the loop; all are familiar to railroad men.

The Y received its name from its similarity to the letter, though it is necessary to join the ends of the Y by a tangent to complete the reversal. As laid out by steam road engineers, the forks of a Y are curves of from 300 to 500 ft. radius and are built so large as to accommodate the long wheelbases and number of flanged wheels of their locomotives without undue stresses and risk of derailment. To turn on such a Y seldom takes less than a quarter of a mile running in reverse.

## Smaller Radius for Turning

The motor car, with its short turning radius, does not need a big Y, and thus, if one is to be installed for the car's use, but a fraction of the land area is required. Fig. 1 shows the room required for a motor car Y that is made from discarded street railway tracks. This is a very satisfactory form of Y and relatively cheap—many of these sections of "special work" are replaced every year, and, though worn out for street cars, the old ones answer every purpose for motor car turning. Rails that are too light for modern main line use may be curved by a rail bender and laid down into a small Y, though the chances are that such a Y would cost more than the discarded street car one when frogs and switches are included. One of these small Y's can be installed along the right of way at almost any point without having to acquire much land, or it may be placed at the end of the line or of a siding where other rolling stock will not be required to pass over it; for its particular purpose very little grading and ballast is needed.

Fig. 2 shows a motor car being turned on the locomotive turntable at the Middletown end of the M. & U. R. R. The building at the right houses two of these cars, as well as the road's locomotives, and the passenger station is but a short distance away. This is a good illustration of a case where a faster reverse in the car would help but little.

One man can turn one of these locomotive turntables, though it is a strenuous task. The turntable shown is 72 ft. overall and weighs 35 tons—the car weighs less than 4 tons and has a wheelbase of 17 ft., at almost the exact center of which a balance is obtained.

Engineers would point to the waste in using so large an equipment for such light work, but in many cases this is justified as the most economical practice. A turntable built especially for motor cars is shown by Fig. 3. These turntables are light weight, have an ample factor of strength and are so easily operated that one man (the car's crew) can reverse the car and be going off in less than three minutes. The circular track is

made in three sections, of a standard light rail, and in this case is of 18-ft. diameter. Costing hardly more than a truck owner pays for a set of rubber tires, such turntables become an economy and can be advantageously installed at various points to which cars are apt to be run.

A neat arrangement of motor car facilities is shown by Fig. 4, which shows those at the Dansville terminal of the D. & Mt. M. R. R. Near the passenger station was a siding for no particular purpose. This was extended to the end of railroad property, almost to the sidewalk, and abutting on the latter a car barn was built. It was supplied with heat from the station, the city water line extended and a gasoline tank installed. Just outside the car barn a turntable similar to that of Fig. 3, but constructed by the railroad's employees, was installed. The car is a White with passenger body. It is kept under the very best of conditions, and the original gear-set reverse is all that is required, for there is less than 600 ft. of backward running required at the terminal.

### Loop Tracks

The loop is essentially a street railway device. Even for the double-ended electric car the loop track is favored instead of changing from one end to the other, and we see its use wherever there is track space for it. At pleasure parks and rural termini and even on city streets the loop is made to serve a greater territory at the same time that the car, continuing ahead, is turning itself. Frequently loops serve as loading stations at parks and points of congestion. All that has been said in regard to the loop applies to motor car operation. In many cases the railroad owns unused property on which worn-out rails may be laid to form the simplest kind of a turning medium, the light weight of the car making it possible to do this with a very few ties, no grading and rails that are otherwise fit only for scrap.

Of car turning units, the first to be considered is

the individual, or carried, turntable. This device has been applied to a number of cars and has proved very satisfactory for the purpose for which it was intended. Cars which are used for inspection and official purposes or in a territory where there are long runs between any turning facilities or being used to carry officials or workmen to the rail's end of a line under construction have found the individual turntable of great value.

### Individual Turntables

So far as information is available, individual turntables have been applied only to shorter, lighter cars, those built upon speed truck chassis. In the opinion of some operating officials it is more desirable to turn the car than to run it backward at a high rate of speed. The individual turntable conforms to this and meets other one-way-running demands.

The individual turntables formerly built were a suspended framework of structurals beneath the center of the car, clearing the rails by several inches. To turn, blocks and jacks were placed in position under this frame and resting on the ties; the car was raised enough to permit the wheel flanges to clear the rails, swung 180 deg. and lowered to the rails again—the operation taking about ten minutes.

A more modern, one-man type is shown by Figs. 5 and 6. This interesting device is built around the Sunderman hydraulic automobile jack and some of its features are patented. Referring to the cross-section, B and B are steel casting spacers riveted to the car frame. To these four are riveted the inverted base P, which is cast from the same pattern as P' below it. To the base P' are riveted two I beams of such size as to rest on the rails when lowered and to safely support the whole weight of the car when raised to clear the rail.

The bore of the base castings is such that a piece of 8-in. steel tubing slides in one end and is tight in the other—the upper one. Base P' is bored clear through

Fig. 1—A "Y" made from discarded street railway tracks. Fig. 4—Turntable and housing facilities used at one railway terminal. Figs. 5 and 6—Two views of a type of portable turntable which is attached to and carried about with the rail car

Fig. 2—(Left)—Turntable used either for locomotives or rail cars. Fig. 3—(Above)—A simple turntable designed especially for rail car reversing

and a foot plate riveted on to lower the position of the jack. The Sunderman 7-ton jack is used, not so much for its greater capacity as for its greater lift. Its height closed is  $13\frac{3}{4}$  in., total lift  $6\frac{1}{2}$  in. and the leverage 540 to 1. A very short movement of the operating lever works the pump. The "ram" is secured to the casting P and so revolves with the turning car, a slot in the casting permitting the lever to project through.

In use, the driver sets the car brakes and takes his jack lever out with him. A few strokes and the I beams have been lowered (pumped) to the rails, a few more and the car is clear of the rails. Then he pushes the car around so the wheel flanges are again in line with the rails and again lowers the car. The weight of the car closes the jack. But from that point it is necessary to supply some force to raise the lower half of the turntable back to its position of rail clearance; this is done by the four springs attached to the swivel plate R, which is held to P' by the collar C. The springs also hold the lower half from vibrating and the plate R is further secured in running position by lock pins fitting in tapered holes.

The tension of the springs is about 200 lb. and these constitute the chief element of friction in turning the car, as the weight of the car is taken by the oil in the jack and the turning (upper) member is revolving on an oil bearing which is practically frictionless.

In placing such a turntable under a motor car the center of gravity has to be determined. As shown for the car in Fig. 5, this is nearly in the middle of the wheelbase. So placed, the propeller shaft has ample clearance when the spacers are used. The turntable complete weighs about 400 lb., it presents a trim appearance and is easily operated.

#### Light Passenger Traffic

One of the most promising fields open to gasoline cars is that of light passenger traffic. This may be the electric road which is struggling against jitney competition and under the burdens incident to power production and distribution, the short-line steam road, or the unprofitable branch of a trunk line. The management in all of these cases finds itself with nothing but the local business of a scattered population to produce a revenue which has to be spread over taxes and fixed charges, labor, maintenance, repairs and (usually) a mountain of debt left by a former administration. In the vernacular of the day, "It can't be done." At least, it can't on a road boasting only steam or electric motive power and having a "traffic" of five or ten persons, perhaps twenty on a good trip. Railroads laboring under such conditions must cease operations or continue at

a loss. Gasoline motor coaches might be operated more economically than the class of cars mentioned, but with the cost of these on a par with that of light locomotives there is no chance of the road in financial straits purchasing either. This narrows the selection to the light motor truck, commonly known as a "speed truck," which has a capacity of about  $1\frac{1}{2}$  tons' load, and is reasonable in price because it is a standardized production job. The speed truck may be converted for rail operation very cheaply and fitted with a body of the bus type, the combination serving admirably for the traffic in view.

#### Securing Higher Speed in Reverse

The one objection to this car is its low speed in reverse—in most transmissions about 20 per cent slower than the car's forward "low." As has been stated before, a faster reverse is always desirable, though it is not always necessary. Now, any change to secure a higher reverse speed involves so much money that the plan of installing such cars may be dropped on this account. And for a time at least this car should have a fast reverse if there is any other traffic over the road, for, being the smallest piece of rolling stock, it will be expected to clear for the nearest siding in either direction for other train movements on the road or in yards; besides which the desirability of this car for special trips, often to points having no turning facilities, will soon be apparent.

Fig. 7 shows what is probably the simplest means of securing a high speed in reverse direction for these cars. It is a unit made up to go in the differential housing in place of the assembly already there and, made up in small lots, has cost less than \$100, from which may be subtracted the salvage on returned parts if the work is done before the car has been used. Housings of the banjo type are especially adapted to this change, though it can be made on most rear ends having a cap removable for the insertion of the differential assembly.

The strong appeal of this design lies in its moderate cost, the ease with which it can be applied and the fact that no structural changes whatever are required. Then, the car has the same three speeds in both direction.

As equalizing gears may be dispensed with on the railroad, there is space for the new unit. It has in the center a double-faced jaw clutch which can be shifted to engage either of the two mating steel pieces which carry also the master gear rings. Both gears are constantly in mesh with the pinion, both turn in roller bearings. The clutch is splined to suit the axle shafts and ordinarily engages the left-side mate; the operator controls the car as in automobile practice, but should a fast speed in reverse direction be required, a shift.

Fig. 7—(Left)—Simple high speed reverse gear. Differential is replaced by a jaw clutch which engages either of two constant mesh ring gears. Fig. 8—(Right)—A direct drive transmission for rail car axles. Any of the ring gears can be engaged, thus affording three speeds in either direction

lever is moved which engages the clutch with the right-side mate and affords three backward speeds in the control.

The only change made in the rear end is the substitution of a cast-iron head in place of the pressed-steel rear cap. The casting furnishes the support for the clutch-shifting members. A spring lock on the inside retains the fork in one of its two positions and also in a neutral if it is desired to use it. The driver's lever has a lock also and is connected with the shift arm by rods.

Another method, and one which has been used on numerous cars, is that of the second gearset, or reverse transmission. This functions only when a faster reverse is desired and is likewise controlled through a separate lever. The three or four speeds of the original gearset are used at all times; in forward running power is transmitted directly through the second gearbox, just as it is in any car when running on the direct drive, but when the separate reverse lever is shifted the power is passed through a lay shaft in the gearset and returns to the main shaft in the opposite direction.

It is optional with the driver of a car equipped with two gearsets to use the one reverse speed in the forward gearbox or the three through the reverse gearbox—if a car movement of only 100 ft. were to be made, the easiest and quickest way would be to slip the shift lever into the reverse corner of the H, while if a longer distance were to be covered the logical procedure would be to use the reverse transmission and step up the speed.

#### Methods of Transmission Construction

Several methods have been followed in the construction of these second transmissions. One has been to utilize the same parts as in the original, as far as possible. There is quite a saving effected this way, as it eliminates most of the special part charges—gearcase and cover, bearings, lay shaft, driver and driven members of the main shaft, clutch and gears can be all standard parts. But the stock reverse would make the car run about one-fourth as fast backward as in the corresponding "speed" forward, consequently the gears selected are chosen to give as near 1 to 1 as tooth clearance will permit. Supports must be provided for the idler reverse gear and welded or riveted to the case and, finally, oil-tight coverings must be applied where two of the newly placed gears cut through the case.

If a number of cars are to be provided with second transmissions it is better to design a simple gearcase to house the reversing mechanism. This is not so expensive if the design utilizes stock transmission parts

as far as possible and departs from them only where simplicity and strength direct. Besides the all-gear transmission, the gear and chain transmission has been used with success. Under this system a pair of gears imparts the reverse direction to the lay shaft, which is spaced further away from the main shaft than in conventional practice, and a silent chain and sprockets deliver the power to the driven main shaft. The chain drive eliminates the idler gear and a good deal of noise.

#### The Direct Drive and Reverse

A direct-drive transmission for rail cars is illustrated by the drawing Fig. 8. Its design will interest those who knew the two-speed rear axle in automobile work a few years ago. On the railroad the chief objection to this type and to rear-end transmissions automatically disappears. It will be noted from the drawing that the continuous live axle A passes through the unit and carries two nests of bevel gears. Each nest provides three speeds in one direction. A triple pinion is employed, and any one of the six gears may be engaged at will with its pinion, and when this is done the rest of the gears merely idle.

The axle A is squared or splined for a portion of its length in the center and upon this square the extended hubs of four gears are caused to slide axially in shifting to these speeds. The low-speed gear in each direction slides on the outside square of an intermediate hub. Cams C move the gears positively and lock them "in" and "out." Reference to the drawing shows that the outer member of these cams rotates (by means of the arm and lever) about one-eighth of a revolution, but it is confined axially by a channel in the housing in which it fits closely. The outer member is double slotted, as shown, and in these slots travel lugs which are a part of the inner member of the cam, which is locked between a shoulder of the gear hub and a nut.

The gearcase is divided in a horizontal plane. From the upper half six shift rods extend forward; these are connected in pairs, so that three rods and as many selectors enter the "quadrant" at the driver's side. At B is a connection for the torque tube. A standard S. A. E. taper pinion end furnishes connection for the drive-shaft universal. This design puts the entire double gearset and right-angle drive in a single case and has the advantage of transmitting the engine's power through but one pair of gears, no matter what direction or speed is selected. It can be applied either on the axle, as shown, or to a jack shaft and in either case can be constructed as rugged as the most skeptical railroad man

may desire, the factors of weight and road clearance not entering as the automobile designer knows them.

Chain driving offers a simple and efficient method of fast reverse running. The gearbox employed for chain drives includes the right-angle gears and jack shaft. Some designs will admit a second master gear (arranged much as the one in Fig. 7) without any alteration—others require a pattern change. Then, the two master gears have a double-jaw clutch put between them, or else they are mounted on a sliding quill, and the same speeds are obtainable in either direction.

The chain drive permits the entire power plant and drive to be attached to a rigid frame and universals of the spline type are sufficient, as there is no angular movement except the slight weave of the frame. The chains take care of such movements as result from spring action, and they permit the use of several types of rugged rear-end construction. For those reasons the chain-drive car is popular with many, and in the railroad field, at least, one purveyor of adapted motor trucks has shown unusual results from their cars in service. Add to this the advantages of an easy, simple and rugged fast reverse.

An entirely different method of reverse running was described and illustrated in AUTOMOTIVE INDUSTRIES of Jan. 1, 1920. Two cars are coupled back to back and

run thus as a train of greater capacity than a single car. The leading car in either direction is the power car and the other the trailer. With reversible seats or longitudinal seats this is quite feasible. Over any steam road, at least, the trailer may be used with a standard motor truck. A number of two-car trains of this kind have been in constant use since 1918 and 1919 and have shown no serious mechanical faults from coupling up in this way. A fast reverse at any point on the railroad is possible with these by just walking through to the other car and starting its engine.

From the foregoing review of the subject it will be seen that it is not a matter of "Can we reverse?"—it is, rather, a matter of "What have you got and what do you want to do?" A universal type of car is possible, but it may not be the most desirable. The factors entering into the consideration are (1) the existing facilities of the railroad for turning cars, (2) the relation of these facilities to stations, other traffic over the road and the terminal car housings to be provided, (3) the type of car it is desired to operate, (4) the nature and location of the traffic the car is expected to serve and solicit, (5) future extensions of motor car service. Careful study of these factors will reveal what supplementary units, if any, are to be incorporated in the new scheme of operation.

## A Popularized Form of Accelerometer

ORDINARILY acceleration is expressed in ft. p. s. p. s., but this means very little to the layman, who does not figure in such terms. Since the force of gravity produces an acceleration of 32.2 ft. p. s. p. s., it may be said to be equal to such an acceleration, and acceleration may be measured in pounds. This principle is made use of in the Drewry testometer, which is an accelerometer graduated in pounds. When mounted on a car it shows the force which is momentarily effective in increasing or decreasing the speed of the car.

The principle of the new device, which is illustrated by the diagram herewith, may be explained as follows: Take a car weighing, say, one ton and imagine it to be frictionless. If now a force of one ton is applied at the rear, it will cause the car to accelerate at the rate of 32.16 ft. p. s. p. s. If the instrument is located on the car, it, of course, will also be subject to the same acceleration, and, consequently, the weight will be forced back until the pointer is at 2240 lb. Of course, an acceleration of 32.16 ft. p. s. p. s. would be impossible, but any smaller acceleration would be indicated by a proportionately smaller movement.

If the car is traveling at a speed of say 20 m.p.h. and the clutch is then thrown out, it at once begins to decelerate, due to the effects of road resistance, wind resistance and internal friction. The rate at which it decelerates will be proportional to the sum of those forces and the instrument will indicate it in pounds. A very common figure for the sum of the three forces is 60 lb. per ton. The reading of the instrument therefore gives a direct indication of the relative freedom of the car. In a similar manner the effectiveness of the brakes can be tested. One set of brakes is applied at a time and the indications of the instrument are read off.

Following are some of the purposes for which the instrument can be used to advantage: The measurement of the rolling resistance when running free; measurement of the retarding force of either the hand or foot brake; measurement of the maximum pull of the engine; measurement of the maximum pull that the clutch will transmit. To measure the maximum pull of the engine

the car is driven up a hill, which is a little too steep for the high gear, and note is taken of the maximum indication of the instrument, which is the maximum pull the engine will exert.

The actual instrument is made somewhat different from the sketch. The indicating medium consists of a horizontal column of fluid contained in a suitably designed closed circuit. When the instrument is moved forward this column endeavors to stay in its original position and in doing so increases the height of a vertical column of fluid against which the horizontal column is balanced. A point is reached when the fluid must move forward with the instrument, and this point indicates the exact amount of force that is being applied to the instrument in pounds for each ton weight of the

Principle of operation of the testometer

vehicle to which it is attached. There are no mechanical moving parts, and, consequently, there is nothing to get out of adjustment. The friction between the fluid and the walls of the tube provide a brake, consequently there are no oscillations, and readings can be made with ease. Each instrument is calibrated separately on a specially-designed machine which eliminates the slight errors due to local variations in the bore of the glass tube. The bore of these recording tubes is held to within a limit of .005 in. The size of the instrument is approximately 10½ in. by 2 in. by 1½ in.; its weight, 1 lb. 3 oz. The instrument will indicate to 500 lb. per ton. The total length of the scale is approximately 15½ in. and the length from 0 to 100 lb. per ton, 4 in.

The manufacturers of the instrument are the Drewry Instrument Co., Baldock Road, Letchworth, England.

# Revision of Steel Standards Is Proposed by S. A. E.

Thirteen new steels to be added, of which five are carbon and six are nickel chromium steels. For the most part they differ from the nearest of the old specifications by their carbon contents. In some of the old specifications retained the amounts of alloying components will be changed.

ONE of the most lengthy reports to be made to the Standards Committee of the S. A. E. at its coming meeting will be that of the Iron and Steel Division. This report, in fact, goes over the whole standardization work previously done by the Division, revising old specifications to bring them in line with modern practice, and adding a considerable number of new ones. At first glance it is not quite obvious from the report just what is old and what is new in it, except perhaps to those who have almost daily occasion to use these standards in their work; for the benefit of others it may be worth while to briefly review the report.

New specifications have been added particularly in the class of carbon steels. Where formerly there were only six carbon steels in the S. A. E. standards, it is now proposed to standardize eleven. The new carbon steels are in the main intermediate between the present specifications with respect to carbon content and conform to them in all other respects. For instance, while there is now a 10 "point" carbon steel and a 20 "point" carbon steel, there is no 15 "point" carbon steel. There has been some complaint on the part of users, whose requirements with respect to heat treatment are very rigid, that the range in carbon permitted by the present specifications is too wide. For instance, the specifications for the 20 point or 1020 steel call for a carbon content of from 0.15 to 0.25 per cent, and inasmuch as both these extremes would pass under the specifications, they would have to be accepted by the purchaser; but it is held that a heat treatment which would give good results with the 1025 steel is unsuitable for the 1015 steel.

## Individual Carbon Range Unchanged

This objection, however, is not met by the revised specifications, as the range in carbon of individual specifications remains the same as before. Even now the specifications cover the entire range of carbon contents, if exception is made of the spring steel; that is to say, if a steel has just too much carbon to come under the specification for the 1025 steel, for instance, it comes under the specification for the 1035 steel. If the new specifications are adopted, practically all steels will correspond to two different specifications.

Take, for instance, the case of a carbon steel with 28 points of carbon and other components as called for by the specifications. At the present time this is a 1025 steel; but if the new specifications are adopted it will be both a 1025 and a 1030 steel. The question now arises, in what way will the proposed change affect the user? In one respect the argument against too wide a range in carbon content from the standpoint of the effect of heat treatment would apply even more forcibly than before, for the reason that heat treatments are specified

in many cases for two steels together that are next to each other in point of carbon content. For instance, the heat treatments proposed for the 1025 and 1030 steels are exactly the same. Thus the steel which may be subjected to this treatment may have a minimum carbon content of 20 points and a maximum of 35. On the other hand, it may be said that the purchaser himself determines whether he wants the 1025 or the 1030 steel, and once this point has been decided, the range in carbon is limited to 10 points, the same as now.

## Changes Insure Adherence to Specifications

There is another line of argument, however, tending to show that under the new series of specifications the purchaser will get steel that will conform more closely to the mean analysis of any given specification. For instance, with the present specifications, any steel that shows 29 points of carbon is sold as a 1025 steel, although it differs from the mean or desired analysis by four points of carbon. If the new specifications should be adopted, it could be sold as 1030 steel and would then differ from the mean analysis by only one point.

Presumably the proposal to adopt these intermediate specifications is based on experience with the nickel-chromium steels, of which there are now specifications calling for 20, 25, 30, 35 and 40 points of carbon. The newly proposed carbon steel specifications are known as Nos. 1015, 1030, 1040, 1050 and 1046. In regard to the manganese range and the phosphor and sulphur limits these steels correspond to the present steels nearest to them in carbon content. The 1046 is a steel in all respects similar to 1045 except that it has a manganese range of from 0.30 to 0.50 per cent, instead of 0.50 to 0.80 per cent. The most marked result of manganese in the steel is to increase the effect of the heat treatment, and presumably the 1046 steel for the same heat treatment would have a lower tensile strength and elastic limit but would be less brittle than the 1045 steel.

In the nickel steel class it is proposed to change one specification with respect to the manganese content and to add one more specification. In the specification for the 2315 steel the manganese content is to be reduced from 0.50-0.80 to 0.30-0.60 per cent. This is a case-hardening steel, and presumably the reduction in the manganese content is for the purpose of avoiding difficulties with cracking and chipping of the case. The new addition to this class is the 2350 specification, which was formulated to meet the requirements of gear manufacturers for gears of large section. The effect of increased nickel content is especially to raise the yield point, and the slightly greater nickel content of this steel as compared with the 2345 would undoubtedly give a somewhat stronger gear.

To the list of nickel-chromium steels there have been added three new case-hardening steels, the 3115, 3215 and 3312. All of these have lower carbon contents than the case-hardening steels of the nickel-chromium type standardized heretofore. It may be pointed out that there are three classes of nickel chromium steel, with low, medium and high ranges of nickel and chromium respectively. In the low nickel and chromium or 3100 class, the case-hardening steel now standardized is known as the 3120, and the additional specification in this class therefore has 5 points less carbon. In the 3200 class (medium nickel and chromium) there has been added the 3215 to the present case-hardening steel 3220. The 3215 naturally has greater core strength than the 3115, on account of its greater content of the alloying metals. In the 3300 or high nickel and chromium class the new specification is known as the 3312, the carbon content in this case being limited to 0.17 per cent. This is a case-hardening steel which gives a core of maximum strength and toughness.

There has also been added a 3245 steel which is sandwiched in between the present 3240 and 3250. This steel is intended for oil-hardened parts, machined or forged, that require very high physical properties, and the reason for putting it forward is undoubtedly the same as that which prompted the proposal of the new carbon steels. In a steel of this class the heat treatment is said to penetrate very deeply.

In the high nickel and chromium class there have also been added steels 3325 and 3335, medium carbon steels which are sandwiched in between the 3320 and 3330 and between the 3330 and 3340 steels respectively.

There are now four chromium steels which are used mainly in the manufacture of ball bearings, and it is proposed to retain the same number, but the specifications of three of them are to be changed somewhat. At the present time the first three of the chromium steels

are made with two ranges of chromium and silicon each, one class having a low chromium and silicon range and the other a somewhat higher range of both components. In the new specifications nothing is said about two classes of alloys. In the first specification, 5120, the manganese content is made 0.30 to 0.60, which is intermediate between the two former ranges (0.25-0.50 and 0.60-0.80). In the 5140 steel the manganese content is to be 0.50-0.80 per cent, which covers the same range as the manganese content of the former high manganese specification and in addition extends 10 points lower. The chromium content of this steel, which is now 0.60-0.90 per cent, is to be increased to 0.80-1.10 per cent. Steel 5150 takes the place of 5165, which means that the mean carbon content has been lowered 15 points. The manganese content of this steel is specified as 0.50-0.80 per cent, which represents a similar change as in steel 5140, whereas the chromium content is to be increased from 0.60-0.90 to 0.80-1.10 per cent.

A very slight change is contemplated in the chrome-vanadium steels 6140 and 6150, in that the vanadium content desired is now 0.19 instead of 0.18 per cent.

In the silico-manganese steel 9250 the manganese range has been increased from 0.60-0.80 to 0.60-0.90 per cent, and in steel 9260 the manganese content has been increased from 0.50-0.70 to 0.60-0.90 per cent. The silicon range of the 9250 steel has been increased from 1.80-2.10 to 1.80-2.20 and the silicon content of the 9260 steel has been increased from 1.50-1.80 to 1.80-2.20 per cent. These changes make the manganese and silicon contents of steels 9250 and 9260 alike and the only remaining difference is in the carbon content. The note now attached to these specifications, to the effect that acid process steel may contain a maximum of 0.05 per cent of phosphorous, has been eliminated and the phosphorous limit on all steel of these specifications is to be 0.04 per cent, it seems.

## Grease Eliminated in Universal Joint Lubrication

**H**ERETOFORE most universal joints have been lubricated by grease, being inclosed in a sheet metal housing which is filled with the lubricant at intervals. The disadvantages of grease lubrication have come to be recognized more and more, and recently there has been a decided trend to do away with it in chassis construction. A type of universal joint which is lubricated entirely by oil has been brought out by the Hartford Auto Parts Co. It is of the tubular cross-pin type with an internal oil reservoir extending the full length of both pins, affording capacity for a liberal supply of oil.

Centrifugal force throws the oil to the end of the bushing retaining sleeves, from which it is fed by capillary attraction to the bearing surfaces of the bushings and pins. A packing of rectangular section completely encircles the working surfaces at the inner face of the bushings and excludes all foreign matter and dirt. These packings are held in position by clamp bands and are readily removed without disassembling the joint. Hardened thrust collars with large bearing areas reduce the side wear between center blocks and yokes.

Refilling of the joint is accomplished by the removal of a single plug at the top of any of the four bushing

Hartford oil lubricated universal joint

retainers. The bearing pressures are distributed over large areas in order to reduce the unit pressure. The crosspins are a press fit in the center block; the small pin keeps the large pin from moving, and a locking screw passing through the center block fastens the small pin securely in position. The bushings are forced into retainers which are screwed in position and are securely located by staking. A separate chamber is provided for oiling the spline shaft, independent of the joint proper, allowing this member to work continually in a bath of oil. It is claimed to be absolutely impossible for dust or any other foreign matter to reach any of the working surfaces.

It will be seen that the joint is of the companion flange type and in appearance is very similar to older models.

# Influence of Surface Flaws on Strength of Metals

It is shown that surface flaws have a pronounced effect upon metals which are subjected to fatigue through repeated stresses, but that such flaws do not always decrease strength under constant load conditions. Results of some practical tests along this line are described in this article.

By Horace C. Knerr\*

**T**HE dire influence of surface scratches, cracks, indentations and re-entrant angles upon the strength of members subject to repeated stress or "fatigue" has been much discussed in engineering literature of late. Nevertheless, some engineers apparently still fail to realize the immense difference which may exist between the effect of such flaws upon the fatigue strength of a member and its strength under constant load.

A striking illustration of this difference was recently furnished in a simple experiment conducted by the writer. The results of the experiment also provide food for thought in regard to the phenomena of tensile tests in general.

Some thin sheet metal (duralumin), in which there were small indentations or cracks here and there over the otherwise smooth surface, was submitted for approval. These flaws had either come down from the ingot or had been introduced by some mistreatment in forging or rolling. They penetrated only a small fraction of the thickness of the sheet. A portion of one of these flaws is shown in the illustration, Fig. 1, between the "X" marks. The cracks are very minute and are accompanied by a surface discoloration of no appreciable depth.

Tensile specimens cut from the sheet so as to have

\*Metallurgist, Naval Aircraft Factory.

one of these flaws running transversely across the gage length of each showed no noticeable difference in strength from similar specimens without the flaws. In other words, the flaws had no appreciable effect on the strength of the material in direct tension. But as this metal was intended for structural parts, subject to vibrating loads, rejection was recommended. A difference of opinion arose as to whether this material should be used, some maintaining that the tensile tests showed the flaws to be harmless.

Facilities for applying a practical fatigue test were not immediately available; therefore, the following simple test was prepared in an effort to show how very misleading ordinary tensile tests may be in regard to the effect of notches on the strength of a part.

Two tensile specimens were cut from adjacent lengths of a 1-in. round bar of  $3\frac{1}{2}$  per cent nickel steel, or 0.25 per cent carbon content. Brinell hardness readings showed no variation along the specimens, indicating their tensile strength to be uniform.

The specimens were alike except that one had a gage length  $\frac{1}{4}$  in. in diameter, while that of the other was  $\frac{3}{8}$  in.

Using a tool with a 90-deg. point, a V-notch was turned in the  $\frac{3}{8}$ -in. specimen at the middle of the gage length, so that the root diameter of the notch was as

Fig. 1—Fatigue specimen of sheet metal, enlarged about 2 diameters, showing flaws between marks X-X. Fig. 2—Nickel steel tensile specimens after rupture. Fig. 3—Nickel steel specimens, showing fracture (enlarged about 2 diameters), and absence of necking in notched specimen

nearly as possible 0.250 in., giving a section area at the root of the notch equal to the section area of the  $\frac{1}{4}$ -in. specimen (see Fig. 4).

The specimens had threaded ends, and the tensile testing machine was provided with ball and socket jaws, so as to avoid eccentric loading.

There was a radical difference of opinion among those present before the test as to the probable relative tensile strengths of the notched and plain specimens. Some believed that the strengths would be the same, but the majority held the view that the notched specimen would be much weaker because of the concentrated stress at the root of the notch.

The results of the tensile test follow:

#### Nickel Steel Specimens

	Notched	Plain
Brinell hardness .....	269	269
Diameter, inches .....	0.252 (at root)	0.250
Area, sq. in. ....	0.0500	0.491
Breaking load, pounds .....	9,530	5,980
Ult. stress, lb. per sq. in. ....	190,500	119,500
Reduction of area .....	None	41 per cent

Both the unit tensile strength and the actual breaking load in pounds of the notched specimen were greatly in excess of the plain one.

The plain specimen showed a clean cup and cone fracture of velvety texture and with pronounced reduction of area and elongation, all characteristic of this steel. The notched specimen showed a fine crystalline fracture and no appreciable reduction of area or elongation.

The photographs, Figs. 2 and 3, show the shape of these specimens and the fractures.

A similar test was run on a pair of specimens of 0.90 carbon steel (drill rod). In this case the results were as follows:

#### High Carbon Steel Specimens

	Notched	Plain
Diameter, inches .....	0.251 (Root)	0.250
Breaking load, pounds .....	8,535	6,865
Ult. stress, lb. per sq. in. ....	172,200	140,000
Reduction of area, .....	None	11.5 per cent

There was very little necking down, and both specimens showed a fine crystalline fracture.

It is evident that a notch may have the effect of greatly raising the apparent unit tensile strength of a piece of metal (figured at the root of the notch). This, of course, is due to the elimination of necking down or reduction of area at the break, and will be more pronounced in ductile metal like nickel steel than in tool steel.

The data for the nickel steel specimen suggests a rather astonishing deduction. The breaking load in pounds, and the ultimate stress (pounds per square inch) of the notched specimen were practically 160 per cent that of the plain specimen. The plain specimen would, therefore, have to be 60 per cent larger in area of cross section to be as strong as the notched specimen—that is, its diameter would have to be 0.316 in. or more than  $\frac{5}{16}$  in. Now, if a portion of the notched specimen on either side of the notch were turned down to  $\frac{5}{16}$  in. diameter, as in Fig. 5, we might expect to see the specimen break in this part rather than at the root of the notch, which was only  $\frac{1}{4}$  in. in diameter. In other words, the notch would have locally strengthened the specimen!

The reader may protest that it is the ridges around the notch which are responsible for the greater strength at the notch, by preventing necking down. True, but how much metal is necessary, and what would be the effect of removing the ridges, as in Fig. 6?

The lines of stress passing through the specimen must converge at the notched section. This leaves a small ring of metal on each side of the notch which carries no tensile stress, as shown at A, A, A, A, in the enlarged sectional view, Fig. 6. These rings of metal may act as supports around the notched section, just as the ridges did. It is, therefore, conceivable that the notched section would still be stronger in tension than a plain portion of larger diameter. There has been no opportunity to indulge in further experiments along this line, however interesting or instructive.

Many interesting lines of thought are suggested by the results of this experiment, and an attempt to discuss them might run into volumes.

It is very clear, however, that there is no connection whatever between the strength of a notched piece in straight tension and its strength under repeated stress. Numerous fatigue tests made by diverse investigators, as well as actual service records, have demonstrated the immense weakening effect of notches in members subject to repeated or alternating stresses. Anyone familiar with fatigue failures will know that the notched specimen would give way much sooner than the plain specimen under a fatigue test. This is just as certain as that the notched specimen would fail at a much lower load in cross-bending, which no engineer will question.

Fatigue tests were eventually run on a number of samples of the defective sheet metal, in comparison with similar samples free from the flaw. The specimens containing the cracks failed in an average of one-fifth the number of reversals of stress withstood by the sound specimens, and the material was rejected.

### The Market in Cyprus

CYPRUS claims to be proud of its 650 miles of motor roads, and particular attention is paid to the maintenance of these. Throughout the island communications are good, and the prosperous natives are importing motor cars at the rate of a 100 a year. As this year's census shows a total population of 310,709 the ratio of imports per head must be regarded as good. There is also a lively demand for tractors, and the agricultural department has instituted a hire service for these machines. Many farmers declare that they are only waiting for the fall in prices to buy agricultural machines. The island's postal service is practically all done by motor transport.

# New Gear Shaper Designed for High Speed Production

Machine built to meet the particular demands of the automobile industry. Designed for increased production, reduced power consumption, accurate work and economy of floor space. Will handle any form of gear entering standard automobile transmissions as well as some special designs.

A NEW design of gear shaper, particularly notable for its high speed of operation, has been produced by the Fellows Gear Shaper Co. The machine is a development of one specially built for the Ford Motor Co. to cut the planetary gears of its transmission. These planetary gear assemblies consist of three gears, which were formerly made singly and riveted together. Cutting the teeth in the gear shaper made it possible to make the three gears in one piece, thus eliminating the riveting and undoubtedly getting a superior product.

The new gear shaper is a production machine in the full sense of the term, yet, by the use of different fixtures, it can be adapted for a considerable variety of work, including the cutting of internal gears. The principles which have been embodied in this gear shaper are interesting as indicative of the latest tendencies in machine tool design. High speed of production has been sought by using high cutting speed rather than heavy feeds. By using a comparatively light feed in combination with a short length of cut—generally the face width of a single gear—heating of the cutting edge of the tool is minimized and the life of the cutter is thereby greatly increased. The light feed, moreover, tends to produce a very accurate tooth surface.

A second aim has been to cut down the power consumption. To this end the machine has been fitted al-

most entirely with ball bearings and the reciprocating parts operating the cutter are made of aluminum alloy forgings, which reduces inertia forces and the pressures and frictional forces resulting therefrom.

Finally, an eye has been had to reduction of floor space. The machine is arranged with all the controls in front, so the operator does not have to walk around it, and a battery of these gear shapers can have their bases bolted together and be driven directly from the line shafting.

The principle of operation of the new machine is the same as that of the standard Fellows gear shaper, in that a gear-type of cutter is used which works on the generating principle. The cutters used on this machine are standard gear shaper cutters, the teeth of which are generated with great precision after hardening. This principle of gear generation is not new, but the improvements which have been incorporated in the new high-speed gear shaper make it possible to apply the principles in a more effective way. Owing to the high speed at which the cutter is operated, and also the short stroke of the machine, "ganging" of gears, except for very thin gears, is unnecessary. Instead of being a disadvantage, this principle has several advantages. In the first place, it is almost impossible to secure accurate gears when holding a large number on an arbor or fixture at one time. Slight inaccuracies in the machining of the blanks multiply in approximately the same ratio as the number of gears being held at one time, so that, from the standpoint of accuracy, it is better to cut one gear at a time.

Another advantage is that, owing to the comparatively short stroke of the cutter it can be operated at a high rate of speed, so that the cutter remains in contact with the work for a very short period of time. In fact, the contact is so short that the cutter does not have time to heat up. The cutter is, therefore, kept cool, and its cutting edge is not impaired, so that the same cutter can be used for both roughing and finishing cuts. The work is also kept cool, and variations due to changes in temperature do not enter into the problem at all. A large-supply cutting compound tank is furnished, from which the compound is pumped to the cutter and work, keeping them cool, thus enabling alloy-steel gears to be cut with great rapidity and accuracy. The general practice is to use heavy feeds and slow speeds for

Fellows high speed gear shaper

Close view showing cover plate removed, exposing feed gears, crankshaft, connecting rod, feed cam, etc.

Cutting helical engine timing gears in high speed gear shaper

roughing and higher speeds and finer feeds for finishing. This machine, however, has been designed to operate at exceptionally high speeds, so by taking fine feeds, the life of the cutter can be increased and its cutting edge maintained, making it possible to use the same cutter for roughing and finishing. This is the fundamental reason why this is such a high production machine.

As on the standard-type gear shaper, change gears are provided for taking care of the difference between the number of teeth in the cutter and the number of teeth in the gear being cut. The method of obtaining the rotary feed for the cutter also differs, in that this function is also taken care of by gears.

#### The Cutter-Spindle and Saddle

The cutter-spindle used on this machine is of comparatively light weight, and is guided in a straight path by accurately finished guides. It is reciprocated by a connecting-rod and crank-arm of light weight (duralumin). The operating end of the crank-arm is provided with a hardened steel segment gear meshing with rack teeth in the cutter-slide. The crank-arm is bronze bushed at the fulcrum point, and provided with ball-bearings at the point where it is attached to the connecting rod; the latter is operated through a crankshaft carrying an adjustable crank-pin, the position of which governs the length of stroke of the cutter. The lower end of the connecting rod is mounted on a self-aligning ball-bearing on the crank pin, permitting the use of high reciprocating speeds.

The crank-shaft, which operates this reciprocating mechanism, is made from an alloy steel forging and is driven from the rear by a single-pulley drive, so that the machine can be arranged for group drive through a jack-shaft, no countershaft being necessary. Provision has also been made for the installation of individual motor drive. A 1-hp. motor provides sufficient power for operating a single machine. A more economical method of operation, however, when a group of these machines is installed, is to bolt the machine bases together and operate them as a unit. When this is done one 6-hp. motor furnishes ample power for ten machines.

The saddle, which carries the cutter-slide, is adjusted for different diameters of gears through a worm, worm-wheel, pinion and rack, and can be withdrawn to permit

locating and removing the work. It is held on guides on the face of the bed. For the depth feed, the saddle carrying the cutter is advanced towards the work by means of a feed cam, provision being made on this cam for taking, automatically, roughing and finishing cuts. The cutter is gradually fed into depth as the blank and cutter are rotated together, and the cutter overlaps on the finishing cut, so as to eliminate the possibility of variations in the thickness of the teeth.

The time in which the gear will be completed is controlled by the speed at which the cutter-spindle is operated, in conjunction with the feed gears located inside the machine. The rotary feed is expressed as so many strokes of the cutter per revolution, and gears are provided for securing seven different feeds, ranging from coarse to fine, suitable to the material being cut. A feed chart is attached to the plate covering the feed gears. The coarsest feed is 435, which means that the cutter would make 435 strokes to one complete revolution of the cutter; similarly, the finest feed is 1735, indicating that the cutter would make 1735 strokes to one

Willis Ste. Claire transmission countershaft and gears cut in Fellows high speed gear shaper

complete revolution. The feed of the cutter, therefore, is controlled by these feed gears, the selection of which is governed by the material being cut. For cast iron a coarser feed can be used than for alloy steel. Roughing and finishing cuts are taken at the same feed and speed.

Little attention is required by the machine as far as oiling is concerned. All of the high-speed shafts are mounted on ballbearings and are automatically lubri-

cated. From a reservoir in the bed holding  $2\frac{1}{2}$  quarts, light machine oil is pumped to additional reservoirs, and from these wicks carry the oil down to the different bearings. The cutter-spindle shoe and guide are oiled by a reservoir in the saddle housing, which is exposed by removing the helmet. This reservoir in turn has wicks leading from it to the various bearing points and is filled with light machine oil. There are three grease cups on this machine, which are used because it was found that for a slight oscillating movement, grease is more satisfactory than oil.

Owing to the fact that all of the reciprocating members on this machine are of light weight, and that all high-speed shafts are mounted on ballbearings, very little power is required to operate it. In fact, as previously stated, a 1-hp. motor furnishes ample power to cut any type of gear within the capacity of the machine.

The automobile manufacturer unquestionably is largely responsible for the advance that has been made in the past few years in the design of gears and probably the best example of advanced practice is the automobile transmission, the gears of which are made from high grade alloy steels, because they are subjected to greater abuse than probably any other form of gear.

The new high-speed gear shaper will handle any form of gear entering into a standard automobile transmission, as well as some of the special designs. For in-

stance, the countershaft gear, illustrated herewith, is made in two pieces, but no rivets are used in assembling; instead the larger part of the countershaft is held to the smaller part by an internal clutch, this clutch fitting the gear on the countershaft itself. The advantages of this scheme will be readily appreciated by the designer. The other gears are the reverse gear, the low and reverse sliding gear and the direct-drive clutch and second speed gear, as well as the direct-drive pinion. All of these gears were cut on the new high-speed gear shaper.

In adapting the new gear shaper to the cutting of internal gears, a slight modification is necessary in the design of the machine, owing to the fact that for cutting an internal gear, the cutter must work on the right-hand side of the center of the work-spindle, instead of on the left-hand side and for this reason a special crank-arm is necessary.

By another slight modification in design the new gear shaper can be adapted to the cutting of helical and herringbone gears, and, of course, produces these very quickly and accurately. In one of the accompanying illustrations the cutting of a camshaft gear for an automobile engine is shown. Practically the only modifications in the machine consist in the use of helical in place of spur guides, the use of helical instead of spur cutters and provision in the machine for changing over for cutting right and left-hand helices.

## New Type of Motor Truck Wheel

A NEW type of truck wheel, similar in construction to the metal wheels which have been used so extensively for agricultural machinery, has been brought out by French & Hecht. Round solid spokes are forged into both the hub and the rim and are held rigidly by substantial heads and shoulders. The firm has been making wheels based on this principle for the last thirty-five years, and millions of them are said to be in use in the hardest kinds of service. These wheels, we are informed, are designed so that they will interchange with the wheels on the truck.

Particular attention is called to the rim construction, which embodies a continuous wedge ring with bolts passing completely through the center of the ring, thereby giving a straight pull without the use of clips. As regards weight, the manufacturers say that it weighs no more than other wheels and usually less. While the photograph shows the wheel equipped with a demountable tire, it is the intention to make it in the detachable form also.

French & Hecht solid spoked steel wheel with demountable rim

## Metal Airplane Construction

AT a recent meeting of the Scientific Society for Aviation in Munich, Mr. Dornier spoke on his experience as manager of the Zeppelin works in Lindau and Seemoos. At the instigation, and with the co-operation, of Count Zeppelin he devoted years to the development of the metal airplane on a broad basis. The principles of construction were: 1, exclusive use of steel and light metals; 2, avoidance of the use of seamless tubes joined by welding; 3, as a result of experience in the construction of airships, the use of profiles built up exclusively of sheet and strip metal parts; 4, connections between the individual parts by means of screws or rivets. The seaplanes which were built on the basis of these principles, after many failures, were characterized by the speaker as follows:

Metal construction of sheet and special sections, chiefly steel with light alloys; no tubes, no corrugated sheets, no welded joints. Inherently stable hulls. Stub boats (that is, hulls with lateral, hollow wing stubs for the purpose of increasing the stability in the water). Wings either entirely of metal or metal with fabric. Smooth hulls without girderwork. All masses, especially that of the engines, near the center of gravity. No gear reduction for the engines. Accessibility and possibility of adjustment of engines in the case of multiple engined planes.

Planes according to these principles have been built of from 60 to 100 hp., wing spread from 26 to 143 ft., wing surface up to 3500 sq. ft., width of hull up to 15.4 ft. and useful load capacity up to 7700 lb.

# Large Scale Production Made Possible by Modern Methods

Rapid improvement in the design of machine tools and production methods has enabled Dodge Brothers plant to greatly increase its production capacity without a corresponding increase in the floor space required.

By J. Edward Schipper

**W**E are so accustomed in these days to think in terms of large production that it is easy to lose track of the rapid advance which has been made in the design of production machines and the development of production methods, especially during the past five or six years. During this period the cost of labor has advanced considerably, yet cars are, in general, selling for but little more than they did at the beginning of this period. With increased cost of labor, the price of materials used in automotive manufacture has increased, hence it is probable that the labor cost in fabricating a car is actually less today than it was five or six years ago. This result has been made possible largely because of the rapid advance in production machines and methods. In other words, increasing costs in many directions have been largely offset by better manufacturing methods and machines.

The economies due to these advances in manufacturing methods have, of course, required large capital investments in machine tool and other equipment, so that organizations attempting to operate on a large production basis have been forced to make these investments to continue business without a heavy handicap in meeting competition. On the other hand, the concentration of manufacturing facilities introduced by employing modern methods and machines makes it possible, at least in some cases, to effect marked economies in respect to the floor space required for a given volume of production, and consequently in the capital investment in buildings.

To use production facilities to the best advantage it is obviously necessary to design the article to be produced in such a way as to adapt it readily to quantity production methods, so that it is necessary to have close co-operation between design and manufacturing departments.

## Increase of Production Capacity

From a production standpoint, the Dodge Brothers car offers one of the most interesting studies there is in the automobile field today. This car was one of the first to be designed primarily with a view to its adoption to large quantity production. The capacity of the Dodge Brothers plant is about 625 cars per day. The different departments throughout the factory are laid out on this basis. The production capacity has been steadily growing since July, 1914. The increase in the floor area of the plant, while large, has not been in proportion because of the greater concentration of manufacturing arrangements. To be exact, the area of the factory has grown from 20 acres to 120, or six times during the six years the company has been in production, while the growth of the production capacity has been far greater than this. The reason for this is that all of the time the company has been increasing its production it has been keeping pace with developments in the machine tool industry and constantly bring-

ing every department up-to-date in this respect. The design of the car itself has changed but little during the six years it has been in production and these changes have been only of a detail and not a radical nature. The machine equipment of the factory on the other hand has been undergoing far greater changes.

Some of the biggest developments in the machine tool industry have come during the past five or six years, and the changes made at the Dodge Brothers plant during this period of time illustrate this fact to a remarkable degree. To look at it in another way, had the machine tool industry remained stationary and the productive ability of the Dodge Brothers plant increased at the same rate as has been the case, the plant would now spread over a far greater area in order to turn out the same number of cars per day. This concentration has resulted from a combination of improved machinery and improved methods which have been worked out in the factory itself.

## Handling the Steel

Starting with the steel yard where raw material enters, this is handled by 5-ton electric cranes, which is probably the quickest and handiest method of transporting and controlling the location of this heavy material. Since practically the entire car is made in the one plant, an enormous supply of steel is required for everyday use. Some idea of the amount of material passing through the Dodge Brothers factory may be gained from some statistics of the purchasing department. In the oil burning furnaces of the heat-treating and drop-forging departments, 20,000 gal. of fuel oil are consumed per day; more than 250,000 lb. of forgings are made per day and over 400,000 lb. of grey iron castings, requiring upward of 30,000 lb. of core sand. It has been estimated that the heat-treating and hardening departments alone require 6500 gal. of oil per day. The automatic screw machine department turns out more than 300,000 completely finished pieces per day. An average incoming shipment of raw material to the amount of 100 freight carloads are received daily.

The machines employed in the manufacturing processes would not be suitable for any but large production plants. In the cylinder block department, for example, in place of having machines which take a roughing cut and then pass the work along to a finish cutting machine, the blocks are rough milled and finish milled on the same rotary miller, these being double cutter machines. The cylinder block is so designed that it is adapted to the rotary millers not only in an endwise direction, giving a fixed dimension for the length and consequently interchangeability in this respect, but the top and bottom surfaces of the block can also be milled on the rotary miller. The cylinder blocks are put through the large rotary millers at the rate of 12 per hr.

Fig. 1—Annealing furnaces where steel parts used in Dodge Brothers cars are heat treated. Fig. 2—Newton rotary milling machine of the continuous type which rough and finish mills the cylinder blocks. The same type of machine is employed for the transmission cases. Fig. 3—Line of steam hammers used in Dodge Brothers forge department.—Note proximity of hammers to furnaces for convenient handling. Fig. 4—Portion of engine assembly department showing how engines are tilted at angle most convenient for operator

Fig. 4—Type of Toledo press used in the pressed steel department. These are Toledo presses and have capacities up to 1500 tons. Fig. 5—Line of fender presses in Dodge Brothers pressed steel department

This operation is shown in Fig. 2. The miller is capable of holding six blocks at a time and when the blocks leave the miller they have received both the rough and finish cuts. The two sets of cutters are visible in Fig. 2.

Another interesting operation on the cylinder block for this car is the drilling, which is a four-way system almost entirely. The four-way drill is, of course, in common use in large production plants. The unusual feature is that in this plant an entire battery of these drills is employed, cutting down the space required for the drilling operations by at least 50 per cent of what would have been required with the drilling machinery available at the time the plant was first put into operation. Both this operation and the operation which was described previously would have been considered practically impossible at the time Dodge Brothers factory began manufacturing. Rough and finish cutting on the same machine was thought to be possible but impracticable. The latest development in multiple drilling at that time was the railway type of drill in which the parts were passed progressively from one machine to the next. In order to save time, the same jig was employed for several drilling machines. By the present method, only one jig is necessary and it does not have to be moved as the 54 spindle machine completes the four-way operation simultaneously.

The turning of the piston is accomplished on semi-automatic machines arranged in nine batteries with a total capacity of 3600 pistons per day. This is sufficient not only for production, but also for service requirements. Under normal conditions, only eight of these batteries are in operation, five of which take care of the roughing of the outside diameter and the ring grooves and three the finishing. These machines are so arranged that they hold the pistons vertically and are semi-automatic, that is, they are loaded by the operator, started, and then when the operation is complete, cut themselves off.

The forge department is equipped with 57 steam ham-

mers. These take care of the complete line of forgings for the entire car from the heaviest part down to the lighter pieces. The capacity of the forges ranges from 400 to 7500 lb. To take care of the capacity production of 625 cars per day, a consumption of more than 250,000 lb. of steel is required by the forge department. A typical line of the forging machines employed is shown in Fig. 3.

The pressed steel work, of which there is probably a higher percentage on Dodge Brothers cars than on any other car, is also handled in the Dodge Brothers plant. The presses handle not only the chassis and engine parts, such as the oil pan and other pressed steel units, but also take care of body, fenders, etc. The presses run up to a capacity of 1500 tons. They are of the type shown in Fig. 4. The fender department is shown in Fig. 5. As will be noted, these presses are of large capacity to handle the deep draw on the Dodge Brothers fenders.

The body of the Dodge Brothers car being entirely of pressed steel, lends itself to the baked enamel finish which is a characteristic of this car. There is no wood construction in the body to burn in the baking ovens, and the trim sticks are not fitted until after the body has been returned from the enameling and baking process. The body department is also highly concentrated and the work there is carried on in a strictly progressive manner, the bodies being continually on the way until they reach completion at the end of the conveyor which takes them through the last oven.

An interesting feature of the engine assembly system is the conveyor system on which engines are carried in a tilted position at an angle which is most convenient for the operator. A portion of the engine assembly line is shown in Fig. 6. It will be noted that the engines in the foreground are carried on one angle, while in the background they are upside down. Sub-assembly lines have been laid out to be adjacent always to the main assembly line so that when the sub-assembly is completed, it termi-

nates at the point at which it is required for the final assembly. This phase of convenience for the operator is given much study throughout the entire organization. The clean aisles which are maintained, the convenience of stock to the point at which it is required and the elimination of manual handling to the last degree are all factors which are considered of considerable importance in securing the desired production efficiency.

Throughout the plant there are many methods and devices used which are applicable solely because of the particular design of this car. One significant example of this is evident in the ability to put the cylinder block on the rotary miller in the manner already described. It is usually possible to employ a machine of this character only for the top and bottom cuts, but to be able to use the same machine for end milling also is unusual if not unique.

## Metric System Bill a Live Issue

**T**HE bill providing for the introduction of the metric system as a standard in the United States, introduced in the House of Representatives April 11, 1921, has a very definite interest to automotive manufacturers. Were it passed it would affect the automotive industry very strongly. A similar bill has been introduced in the Senate and both measures are now in the conference stage. Hearings on the bill are now being conducted before a sub-committee of the Senate Committee on Manufactures. Advices from Washington indicate that there is a very fair chance that the measure will reach the floor of Congress sometime next spring. The bill is reprinted here as a matter of information to automotive manufacturers.

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled, That from and after ten years from the date of passage and approval of this Act the weights and measures of the meter-liter-gram or metric system shall be the single standard of weights and measures in the United States of America for the uses set out herein.

Sec. 2. That the national prototypes of the fundamental standards of the metric system shall be the copies of the standards known as meter numbered twenty-seven and kilogram numbered twenty, allotted to the United States by the General Conference of Weights and Measures held at Paris in 1889. These are now deposited in the vault of the Bureau of Standards of the Department of Commerce and are those which are now used and employed in deriving the values of all weights and measures used in the United States. These national representations are hereby adopted as the primary standards of weights and measures for the United States of America, and from these all other weights and measures shall be derived and ascertained.

Sec. 3. That from and after ten years from the date of passage and approval of this Act no person shall do or offer or attempt to do any of the following acts, by weights or measures, in or according to any other system than the metric system of weights and measures, namely:

(1) Sell any goods, wares, or merchandise except for export, as provided in Section 8;

(2) Charge or collect for the carriage or transportation of any goods, wares, or merchandise.

Sec. 4. That from and after ten years from the date of passage of this Act no person shall use or attempt to use in any of the transactions detailed in Section 3 any weight or measure or weighing or measuring device designed, constructed, marked, or graduated in any other system than the metric system of weights and measures.

Sec. 5. That not later than ten years from the date of passage and approval of this Act all postage, excises, duties, and customs charged or collected by weights or measures by the Government of the United States shall be charged or collected in or according to the metric system of weights and measures.

Sec. 6. That rules and regulations for the enforcement

of this Act not inconsistent with the provisions hereof shall be made and promulgated by the Secretary of Commerce. The Secretary of Commerce shall also take such steps as he may deem expedient for giving publicity to the dates of transition specified herein and for facilitating the transition to the meter-liter-gram or metric system.

Sec. 7. That all Acts or parts of Acts inconsistent herewith are hereby repealed but only in so far as they are inconsistent herewith; otherwise they shall remain and continue in full force and effect. Whenever in any Act, or rules and regulations, or tariff or schedule made, ratified, approved, or revised by the Government of the United States of America weights or measures of the system now in customary use are employed or referred to, and to comply with the provisions of this Act weights and measures of the metric system should be employed, then such references in such Act, rules and regulations, tariff, or schedule, shall be understood and construed as references to equivalent weights or measures of the metric system ascertained in accordance with the required degree of accuracy.

Sec. 8. That nothing in this Act shall be understood or construed as applying to—

(1) Any contract made before the date at which the provisions of this Act take effect;

(2) The construction or use in the arts, manufacture, or industry of any specification or drawing, tool, machine, or other appliance or implement designed, constructed, or graduated in any desired system;

(3) Goods, wares, or merchandise intended for sale in any foreign country, but if such goods, wares or merchandise are eventually sold for domestic use or consumption then this clause shall not exempt them from the application of any of the provisions of this Act.

Sec. 9. That nothing herein shall be understood or construed as prohibiting the enactment or enforcement of weights and measures laws or ordinances by the various States or cities, and the various States or cities shall have the same powers as though this Act were not in force and effect: Provided, however, That no standard weights or measures shall be established for the uses set out herein which conflict in any way with the standards established herein, and such standards which may already have been established shall be null and void for the uses set out herein.

Sec. 10. That the word "person" as used in this Act shall be construed to import both the plural and singular, as the case demands, and shall include corporations, companies, societies, and associations. When construing and enforcing the provisions of this Act, the act, omission, or failure of any officer, agent, or other person acting for or employed by any corporation, company, society, or association, within the scope of his employment or office, shall in every case be also deemed to be the act, omission, or failure of such corporation, company, society, or association as well as that of the person.

# Trailer Registration Fees High in Many States

Parallel truck fees and restrictions in many instances and the amount of the tax stands as a direct sales resistant. Salesmen must show how economic advantages of the trailer will counterbalance the high fees charged. As with trucks a complete lack of uniformity is a paramount feature.

**T**RAILER registration fees in a majority of the 31 states that impose taxation upon this form of vehicle stand out distinctly as being considerably higher than the amount that has been considered fair and equitable by the Motor Vehicle Conference Committee, composed of representatives of the automotive industry and various highway bodies. There appears to be in many states a direct tendency to discourage the use of trailers which have proven themselves to be an economic factor of transportation.

Many of these fees have been placed at a figure so high as to make the taxation a direct sales resistant, especially when it is considered that the amount of the trailer fee must be added to the amount of the truck fee. As would be expected, most of the states calling for the highest fees for trucks impose the highest taxes upon trailers. Thus, in a State such as Wyoming, where the fee for a 5-ton truck is \$100, the added tax of \$75 for registering a 3-ton trailer is quite apt to cause the prospective purchaser to consider carefully before he buys the latter vehicle.

Under such conditions it behooves the trailer salesman to be able to show his prospective customers that the increased efficiency that will result from the use of a trailer will more than offset the added cost of the high registration fee. A study of the trailer situation

in this respect will show that a great similarity of conditions exists as to trailers and trucks. Recently AUTOMOTIVE INDUSTRIES published an article with tables and charts showing the effect state laws are apt to have upon motor truck sales, and it can easily be seen by comparing the figures for the two vehicles that the situations are almost identical. In fact, in many states the trailer fees are exactly the same as the truck fees, or are determined by the same methods.

Trailer fees vary, of course, with the size and weight of the vehicle, but for purposes of discussion this article will deal with a trailer of 3-ton capacity. Certain physical characteristics must be assumed in order to determine a fee for this trailer, for, as with the trucks, there are many different ways by which the amount of the fee is determined. These physical characteristics are shown with the accompanying chart.

It will be seen on this chart that the highest fee for this type of vehicle is in Florida, where \$95 is charged upon registration. The lowest is in California, where a flat rate of \$2 is charged for all trailers. These present two extremes: the one so high that the single truck owner, at least, is apt to need considerable encouragement before he can be persuaded to buy a trailer of this type, and the other so low that trailers in that state do not furnish their share of the revenue necessary to

Chart showing the costs of registering a three-ton capacity trailer in the 31 states having trailer laws in effect. This chart is based on the assumption that the trailer has a gross weight of 8,500 lbs.; is equipped with four solid tires of 5 in. width each, and has an original cost of \$1,000

## Changes in Trailer Registration Fees

(This table prepared from data gathered by the Motor Vehicle Conference Committee)

State	Date new law effective	Old Fees	New Fees	State	Date new law effective	Old Fees	New Fees
Alabama	No trailer law			Missouri	No trailer law		
Arizona	No trailer law			Montana	No trailer law		
Arkansas	May 1, 1921		Ton Capacity Pneu. tires 1 or less.....\$10 1 to 2..... 15 2 to 3..... 25 3 to 4..... 40 4 to 5..... 50 No schedule fixed for solid tires.	Nebraska	No trailer law		
California	No new law	Per trailer.....\$2.00	No change	Nevada	No new law	Same as trucks	No change
Colorado	No new law	1 to 2-ton capacity.\$10 For each additional ton..... 5	No change	New Hampshire	Jan. 1, 1922	No fees previously charged	Per 100 Pneu. sol. Met. lb. gr. tires wt. trailer & load \$0.60 \$0.85 \$1.00
Connecticut	No trailer law			New Jersey	Jan. 1, 1922	Same as old truck fees	Same as new truck fees
Delaware	No new law	Per 500 lb. gr. wt., \$2.00 Metal tires, double fees if gr. wt. exceeds 1,500 lbs.	No change	New Mexico	Jan. 1, 1922	No fees previously charged	Rubber Metal Per 100 lb. tires tires rated cap. \$0.25 \$0.50
Florida	Jan. 1, 1922	Same as trucks if over 500 lbs. capacity. Under 500 lbs. capacity, no fees.	Pneu. Solid Per 100 lb. tires tires gr. wt....\$0.75 \$1.12	New York	No new law	Gr. wt. Fee Tons 2 or less \$5.00 2 to 5 10.00 5 to 7 15.00 7 to 10 20.00 10 to 14 30.00 Plus \$5 for each ton over 14.	No change
Georgia	No trailer law			North Carolina	July 1, 1921	Ton Capacity 1 \$10 Plus \$20 for each additional ton.	Per Ton Capacity \$15
Idaho	No new law	Same as trucks	No change	North Dakota	No trailer law		
Illinois	No trailer law			Ohio	No new law	Per 100 lb. gr. wt., \$0.20	No change
Indiana	Jan. 1, 1922	Ton cap. of truck drawing trailer Fee 1 to 1 \$3 1 to 2 5 to 7 1/2 \$20 2 to 3 5 7 1/2 & over 25 3 to 5 15	Ton capacity Fee Less than 1..... \$3 1 to 2..... 6 2 to 5..... 10 5 to 7 1/2..... 20	Oklahoma	No trailer law		
Iowa	Jan. 1, 1922	Cap. Fee Iron 2 or Pneu. or more tires steel solid 1 to 1 \$10 \$15 \$10 1 to 2 15 30 15 2 to 3 25 .. 35 3 to 4 40 .. 50 4 to 5 50 .. 60 5 to 6 60 .. 70	Ton Capacity Pneu. 2 or 1 to 1 \$10 1 to 2 15 \$5 2 to 3 .. 15 3 to 4 25 35 4 to 5 40 50 5 to 6 50 60 6 to 7 60 70 No change for metal tires. Trailers with capacity of less than 1/2 ton not subject to fee.	Oregon	Jan. 1, 1922	1/2 old truck rates	1/2 new truck rates
Kansas	No trailer law			Pennsylvania	Jan. 1, 1922	Same as old truck fees	Same as new truck fees. With metal tires, double regular fees. No fee required for trailers weighing less than 500 lbs.
Kentucky	No trailer law			Rhode Island	Jan. 1, 1922	No fees previously charged	Pneu Solid Metal Per 100 lb. tires gr. wt. \$0.15 \$0.25 \$0.35
Louisiana	No trailer law			South Carolina	No new law	Per trailer, \$5 plus \$2 per 1,000 lb. carrying capacity	No change
Maine	Jan. 1, 1921	No fees previously charged	Pneu. Solid Iron Per 100 lb. gr. wt. \$0.15 \$0.40 \$0.75	South Dakota	Jan. 1, 1922	No fees previously charged	Same as trucks
Maryland	No new law	1-ton capacity \$10 plus \$20 for each additional ton. Metal tires, double above.	No change	Tennessee	No trailer law		
Massachusetts	No new law	Pneu. tires, 1/2 truck rates. Solid tires, same as trucks. Metal tires, double trucks.	No change	Texas	Jan. 1, 1922	No fees previously charged	Pneu Solid Metal Per 100 tires gr. wt. \$0.15 \$0.25 \$0.35
Michigan	No new law	Per 100 lbs. of trailer's weight \$0.50	No change	Utah	April 1, 1921	No fees previously charged	Ton Cap. Pneu. Solid Metal 1 \$10 \$15 \$15 2 15 25 50 3 25 40 .. 4 40 60 .. 5 50 75 ..
Minnesota	April 5, 1921	No fees previously charged	2% of value. Minimum fee for 1 ton or less, \$10, plus \$2 per ton or fraction thereof over 1 ton.	Virginia	No new law	1 Ton Capacity, \$15, plus \$3 per each additional 1,000 lbs.	No change
Mississippi	No trailer law			Vermont	No trailer law		
				Washington	No new law	Same as trucks	No change
				West Virginia	No new law	Ton Cap. Solid Pneu. tires 1 or less \$10 \$5 Each additional ton 15 7.50	No change
				Wisconsin	No trailer law		
				Wyoming	Jan. 1, 1922	No fees previously charged	Same as trucks. No fee required for trailers of less than 500 lbs. capacity

insure proper highway maintenance. It should also be remembered in this connection that there are 18 states that charge no fees whatever for trailers. Some of these latter states are ones in which truck fees are unusually high. The fees discussed here are ones demanded for trailers equipped with solid tires. Eleven of the 30

states considerably reduce the fees where pneumatic tires are used. These states, together with the amount charged for the typical 3-ton trailer equipped with pneumatic tires are as follows: Florida, \$63.75; New Hampshire, \$51; Indiana, \$25; Utah, \$25; Pennsylvania, \$24; Oregon, \$21; West Virginia, \$20; Massachusetts, \$15;

Maine, \$12.75; Rhode Island, \$12.75; Texas, \$12.75.

These, compared with the fees required for solid tires, are considerably lower in most cases, but in the other 20 states no distinction is made.

So far as trailer weight and size restrictions are concerned, they are practically identical with the truck restrictions. In several states there is a limit to the length of a truck and trailer combination allowed, but these restrictions were shown in the truck tables.

A glance at the accompanying chart will serve to show the absolute lack of uniformity that exists in trailer fees. Little else could be expected, however, if a study of truck fees has been made. There is about the same variance in method and result that was so evident in connection with trucks. What is true of the 3-ton trailer discussed in this article would also be true of other sizes of vehicles. Most states, as was stated at the outset, are demanding registration fees considerably higher than the amount decided upon by the Motor Vehicle Conference Committee when it submitted the Proposed Uniform Vehicle Law to state legislators. Under that law the fees would be computed upon the following basis:

	Per 100 lb. gross weight of vehicle and load
Equipped with	
Pneumatic tires.....	15 cents
Solid tires.....	25 cents
Iron, steel or other hard tires.....	35 cents

There are at the present time two states using this basis in its entirety. These two states are Rhode Island and Texas. The fee for the typical 3-ton trailer under such a law would be \$20 if equipped with solid tires. There are 20 states charging more than this amount, three have placed the fee at \$20 and eight charge below the fee considered fair. If equipped with pneumatic tires the fee for such a vehicle under the Proposed Uniform Vehicle Law would be \$12.50.

From a sales standpoint it is believed that these excessive fees will do more to hinder trailer sales than the excessive truck fees will do to hinder truck sales. The prospective purchaser of a truck usually has made up his mind that a truck is necessary to the conduct of his business, and about the only doubt left in his mind is as to the make he should buy. The trailer prospect, however, may feel that a trailer would be something of an asset, but not a necessity. If he knows that he must pay an annual fee of something like \$40 or \$50, or more, to operate this trailer, he is quite apt to decide that his business can well do without such added equipment. This would apply particularly to the man with but one or two trucks.

Sales managers, therefore, would do well to make a close study of these trailer fees with a view to learning how best to overcome this sales resistant. They should then study the economic possibilities of the trailer and learn how increased efficiency from its use will counterbalance the registration fee.

## New Model Lavine Steering Gear

**L**AVINE steering gear, which is of the split nut type, having every working part hardened and ground, is now being produced. The housing and its cover of this new model are made of malleable iron castings, which are straightened under a 30-ton drop hammer. The worm and sliding heads are made of alloy steel, carbonized, hardened and ground. The tolerances on these parts are 0.001 in. plus and minus. The trunnion blocks are made of chrome-vanadium steel, heat-treated. The trunnion shaft forging is thoroughly annealed to relieve forging strains, machined and then heat-treated for toughness and high tensile strength which is said to run about 140,000 lb. per sq. in. Finally, this shaft is ground to tolerances of plus and minus 0.001 in. The end of this shaft is machined with thirty-six 90-deg. splines or serrations, to insure a dependable set for the ball arm. The ball arm is made of carbon steel, heat-treated. The particular heat-treatment it gets is designed to render the steel of the arm very tough so as to enable it to withstand the shocks to which it is subjected in service. A taper pin is used in connection with the ball.

The trunnion shaft is mounted in bronze bushings made of an 86 copper, 12 tin, 2 zinc composition which is said to be very hard. All tubing used on this gear is passed through a tubing resizing machine, insuring tubing true to size. Bronze bushings are inserted at both ends, these bushings being machined and

reamed, a precaution taken to prevent rattle in the gear.

The worm is secured to the worm tube by a shrink fit and is then further secured by two Woodruff keys which are spot-welded to hold them in place, after which a collar is shrunk over them. This collar is again spot welded in eight different places. The controls are made by the die-casting method.

Attention may be called to the provision for effective lubrication of the worm wheel shaft whose bushing is made in halves with a grease reservoir between.

# South African Tractor Market Demands Study

## Part I

American tractor leads in popularity, but manufacturers should analyze the territories there with a view to furnishing machines adapted for the kind of work each district requires. Factors determining types needed.

By George B. Bell\*

THE growing importance of agriculture in South Africa was clearly reflected in the 1920 imports of agricultural implements, among which probably no classification showed a greater increase than the imports of tractors. This fact is brought out in a report received from Trade Commissioner P. J. Stevenson, which discusses in considerable detail the many factors which affect, favorably or adversely, the sale of American tractors. According to this report, in 1920 the Union of South Africa imported 736 tractors valued at £199,626, compared with 294 imported in 1919 and valued at £53,312. The following table gives the quantities, values and country of origin of these imports:

	1919		1920	
	Quan.	Value	Quan.	Value
United Kingdom .....	4	£1,096	148	£56,874
Canada .....	21	4,239	14	2,800
Belgium .....	..	....	1	200
Italy .....	..	....	3	1,676
United States .....	269	47,977	570	138,076
	294	£53,312	736	£199,626

This statement shows that the American tractor leads all others in popularity in the Union, comprising, in 1919, 91 per cent of the total number imported, and, in 1920, 77 per cent. Figures showing the imports of tractors for 1921 are available for the first eight months, during which period 62 tractors valued at £40,637 were imported, as compared with 485 tractors valued at £107,107 imported in the corresponding period of 1920.

The deflation movement, which has had an especially paralyzing effect on the producers of raw materials, has caused, temporarily, what practically amounts to a cessation of the sale of tractors to the farming community. Although the South African farmer enjoyed five years of exceptional prosperity during the war period, the agricultural community to-day is in the worst position of any section of the country. This is due, of course, largely to the uneven economic balance which prevails, but also to the fact that during the days of prosperity the credit of farmers was high and they were enabled to borrow heavily for the purchase of additional land, better grades of stock, as well as general improvements. Consequently, at the present time, when farmers are forced to buy high-priced manufactured products with the reduced incomes resulting from low-priced raw materials, the market for expensive equipment is considerably curtailed.

In considering the market for tractors, it must be borne in mind that there are only 81,018 occupied farms and agricultural holdings, according to the latest agricultural census of 1920. The number of farms and the acreage, as reported in the census of April 30, 1920, were as follows:

	Occupied		Unoccupied	
	Number	Acreage	Number	Acreage
Cape Province..	32,515	117,301,293	1,315	9,981,129
Natal .....	8,807	9,046,642	488	877,642
Transvaal .....	23,502	37,652,296	2,747	11,219,404
Orange Free State .....	16,190	29,191,196	935	914,134
	81,014	193,191,427	5,485	22,992,309

As is apparent from this table, the Cape Province is the largest farming district in the Union. The South-western districts of the Cape Province and also the Eastern districts are well cultivated. In Natal there is intense cultivation in the coastal section and in the extreme West, as well as in Zululand, while in the Orange Free State the main agricultural districts are located in the Northeastern section. In the Transvaal agriculture is fairly uniformly distributed, excepting the extreme Northern and Western districts, where, because of the inadequate transportation and rainfall, respectively, there is a sparse population. The chief crops grown in the Union from May, 1919, to April, 1920, are shown in the following table, by provinces:

	Cape	Natal	Transvaal	Orange Free	Total
	Acres	Acres	Acres	Acres	Acres
Wheat .....	588,361	3,068	91,629	133,655	816,713
Rye .....	112,254	439	3,509	24,615	140,817
Barley .....	72,892	854	6,938	4,252	84,936
Oats .....	446,438	7,706	83,889	108,705	646,738
Maize .....	239,797	400,227	1,773,552	1,576,841	3,990,417
Kaffir corn ..	25,153	34,117	188,130	90,145	337,545
Potatoes ...	19,488	7,978	30,534	41,341	99,341
Tobacco ....	6,347	1,724	16,681	977	25,729
Cottonseed ..	87	4,423	6,910	10	11,430
Chicory ....	688	40	67	...	795
Ground nuts (Peanuts) .	171	1,749	11,002	257	13,179
Tea .....	...	3,728	...	...	3,728

Conditions under which tractors are used vary considerably throughout the Union. On the High Veldt of the Transvaal and on the Low Veldt of the Orange Free State, tractors are used at fairly high altitudes. According to an article in *Commerce Reports* of Aug. 18, 1921, which was reprinted from the *London Times Trade Supplement*, the loss of power in internal combustion engines at an altitude of 4000 ft. amounts to 10 per cent. Ameri-

\*Chief Agricultural Implements Division of the Bureau of Foreign and Domestic Commerce. Condensed from an article appearing in *Commerce Reports*.

can experts who have been consulted on this point place the loss at about 20 per cent at 5000 ft. elevation. At an elevation of 3500 to 4000 ft., such as is to be found in some parts of the Orange Free State and Zululand, the loss would be somewhat less, averaging from 12 to 14 per cent, and slightly higher at the 6000-ft. elevation often found in the Transvaal. Along the coastal districts of Natal and in the Cape Province this loss does not occur, but power is slightly increased by reason of the greater humidity of the atmosphere.

The type of tractor required is determined to a large degree by the character of soils and other general working conditions, and these questions must be considered along with the altitude at which the tractor is to be used. In Zululand, where sugar is the main crop, plowing is rendered difficult both by the presence of the roots of the sugar cane from previous crops and by the lack of rainfall. Throughout Natal and the Cape Province the soil is usually fairly light, containing considerable sand, which makes for easier working, as does the great rainfall which this section generally receives. This soil can be compared to that found in the central or eastern part of North Carolina. In the Transvaal there is found in considerable quantities, red clay, black turfs and a mixture of sand, as well as loamy alluvial soils along the streams. The soil in the Orange Free State is usually a red, sandy clay, corresponding to the "gumbo" soils in the United States. Due to the rapidity of evaporation and the long dry spells, the ground becomes intensely dry and hard, both in the Transvaal and the Orange Free State. As a result of these conditions light tractors that have been successful in Natal and the Cape Province, where working conditions are most favorable, have been utter failures when tried in the Transvaal or the Orange Free State.

The unscientific sale of tractors to be used under conditions for which they are utterly unsuitable has done considerable harm to the development of the tractor trade. The successful handling of this particular problem is of vital importance to any manufacturer. The sale of tractors, even under normal conditions of prosperity, is not an easy proposition, and every care should be taken to insure sales based upon technical advice as to the suitability of various models to the various conditions prevailing in South Africa. In this connection attention should be called to the fact that descriptive matter prepared for distribution throughout the Union should take into account local working conditions. For example, the tractor which can easily handle six or eight plows in certain parts of the United States could perhaps handle only two or three in the Transvaal.

One of the most successful manufacturers in the United States builds for South Africa the same models that are used in the home market, without a single change. Engines should be specially built for this country, laying down certain specifications for revolutions, the reduced speed supposedly leading to a longer life and more satisfactory working of the engine. Another point referred to was the excessive dust cloud rising in the plowing operations. Unquestionably, the working parts of a tractor must be dust-proof for use in South Africa, just as in America, although it is particularly necessary on the Low and High Veldts. Generally speaking, however, the American tractors which have

been supplied have been satisfactory as far as their mechanism and design are concerned without any alteration or change.

The average farmer in South Africa is fairly well acquainted with the use of machinery, and can be expected to have little difficulty in running a tractor. It is not true that the South African farmer requires a machine that is capable of being overdriven or overworked, or that the cheapest kind of labor will be put in charge of a tractor as soon as it has demonstrated its worth. Native labor is seldom used for the operation of tractors, and mistreatment of the machinery is of rare occurrence. The farmer who is progressive enough to spend hundreds of pounds on a tractor as an investment is not likely to fall into any such error and can be expected to use care and follow instructions from the manufacturer as to the handling of the equipment.

It appears that the trend of conditions in South Africa will be to make it easier for the tractor to compete with the oxen and other draft animals. Improvement of exchange and lower factory prices, which will be followed by a lower selling price in the Union, will serve to broaden the market. As a result of different kinds of educational work, both direct and indirect, the farmer is becoming increasingly more progressive, and will conduct his farming operations on a more intensive scale than in the past, and in order to do this most efficiently he will realize that he must utilize the most modern and up-to-date methods available.

American tractors, generally, are bought in preference to those made in any other country. Several machines from foreign makers have been used in the various districts, but the opinion of the farmers there seems to be that American machines are best. There is still room for improvement, however, and a careful study of the demands of the market there should give to American manufacturers a knowledge that will prove immensely valuable in stimulating and developing sales.

## Commercial Aviation Abroad

DEVELOPMENT of commercial aviation has progressed more rapidly in France than it has in England. Last June French air companies carried 1553 passengers. Those in Great Britain carried only 400.

According to various estimates France in 1920 carried 5864 passengers as against 729 in 1919. An increase in the amount of merchandise carried was also recorded. The figures for 1919 were 14,080 kilos, while in 1920 the total was 124,195 kilos. More than 1,000,000 miles were traveled by commercial planes in 1920.

The longest traffic route at present is the one from Toulouse to Casablanca, Morocco, which takes about a day and a half with a stop over night. Other foreign services include: Paris-London, four times daily, two and one-half hours; Paris-Brussels, two hours; Paris-Amsterdam, four three-quarter hours; Paris-Strasbourg-Prague, seven hours; Paris-Warsaw, daily except Sunday, twelve and one-half hours; Bayonne-Bilbao-Santander, daily, two and one-half hours.

Services within France include: Bordeaux-Toulouse-Montpellier, three and one-half hours; Montpellier-Nîmes-Avignon-Nice, twice weekly.

# The FORUM

## What Another Owner Thinks

Editor, AUTOMOTIVE INDUSTRIES:

Taking courage from Mr. Harold Blanchard's letter as quoted in your magazine of Dec. 1; I desire to add a few observations taken from the users' point of view.

A recent contribution to your magazine states that the car owner is "boss of the industry." Is this strictly according to fact? When the electric starter was placed on the market in 1911 the vague need for a reliable self-starter doubtless arose in the mind of the owner, but the type, application and development was in the hands of the automotive engineers. I believe the same state of affairs existed in the development of the eight and twelve-cylinder engines, the hot-spot manifold and thermostats.

It would appear then that the engineers have a great opportunity to place in the hands of the owners more economical cars. Recent discussions regarding fuel economy indicate that lower normal engine speeds under light duty are desirable. Otherwise stated this means higher gear ratios. The cry is raised that four speeds are not wanted and the owners do not want to shift gears. My observation has been that it is not the shifting gears that is objected to, but the noise of the geared speeds. Several years ago I equipped a light six Thomas with a Cadillac-Timken two-speed rear axle, using a hand lever to operate the shift. The fuel economy improved 20 per cent, and I will never forget the look of astonishment that came over the face of a driver of a much bigger car when I suddenly, quietly glided away uphill without the noise of any gears. Again, a 6-60 Alco geared 2½ to 1 on fourth speed is regularly averaging 10 to 11 miles to a gallon with an unheated intake pipe. This car has a displacement of 579.5 cu. in. I have yet to find an eight of 314 cu. in. or a twelve of 424 cu. in. that can make the same average.

Given two direct drives of, say 3 to 1 and 4 to 1, and a two-speed transmission, it would appear that economy comparable to foreign practice could be obtained.

Why do engineers insist upon putting brake levers in front of the rear axle, where they collect all the dirt and rarely get any attention? A grease cup or Alemite connection under the floor boards is wasted, yet the latest and best cars persist in the practice. Is there any reason why brake rods and levers cannot be inside the axle housing, with the pull rods running up the torque or enclosed drive shaft tube? The external band brakes of current practice have been criticized quite extensively of late, and it is to be hoped that four-wheel internal brakes or transmission brakes with one set of internal brakes will become the rule.

With reference to one of the cheap cars, why, oh why, after such improvements as pressed steel running board brackets, new fan bearings, do they still leave the timer and wires in the slough of despond? The business in timers and wires for this car seems to be thriving and is the commonest replacement made. This condition has existed for a mere ten years.

Headlights have recently been subject to legislative

restriction. Doubtless signaling devices will soon come in for their restrictions. The number of narrow escapes a driver will have in a day in any city from sedans and coupes breaking out of the curb line with all windows closed and no signal is familiar to most of us. Cannot the S. A. E. formulate a standard signaling device for closed cars and have it put on properly at the factory making it just as much a part of the car as the brakes or horn? People who use closed cars want to keep warm and dry, and therefore will not use the window available for signaling. The owners still maintain enough energy to push a horn button, another button to operate a "Right, Left and Stop" signal would not greatly over-exert them.

With a last reference to the two-speed rear axle. A design similar to the Stone-Probst, Austin or the old Berliot or Alco chain drive double bevel construction seems to be capable of refinement so that the unsprung weight would not greatly exceed present construction. This could be further insured if the band brakes were removed and aluminum or pressed steel internal shoes with suitable lining were used on the internal brakes. Anyone who has driven a double direct drive car knows the feeling of reserve power and smoothness that this construction gives.

ELLERY CHANNING WOOD.

## Motorcycles on the Farm

Editor, AUTOMOTIVE INDUSTRIES:

We have read with a great deal of interest the article of Marketing the Motorcycle, by Norman G. Shidle.

As we are thorough believers in market analysis, we can, we believe, appreciate the importance of Mr. Shidle's message. While we have not tried to check up the figures he quotes, nor are we prepared to say whether we agree in all of his deductions or not, we do believe that he has overlooked an important phase of the motorcycle market—the farm market. It is to that we wish to call your especial attention.

There are several reasons why motorcycles can be sold to farm boys. The enormous increase in automobiles on farms has, to a considerable extent, educated the boys to more speed than they can attain when driving horses.

The use of motorcycles by rural mail carriers has demonstrated their adaptability to country roads. It has demonstrated also the practicability of carrying fair sized loads. This factor has undoubtedly had a stimulating influence on motorcycle sales.

Because the motorcycle is a utility machine, economical of operation, with plenty of speed and power, it is possible for the farmer to send into town for repair parts when a breakdown occurs in the rush season.

As you undoubtedly know, a great number of farm boys attend high school in nearby villages. In this connection, it is interesting to note that the average farm is 4.8 miles from the nearest market. In this instance we interpret market to mean also the nearest point in which a school is located.

You will be interested in knowing that in our investigations we have found that there are an average of 1.6 men

above the age of sixteen on the average farm in our territory.

In the following table we have set up the number of farm families in each state in our territory—which we call our Heart Territory—and alongside that the number of men and boys in each state above the age of sixteen.

Number of Farm Boys and Men Sixteen Years of Age and Over

Heart States	Number of Farm Families	Number of Farm Boys and Men Over 16
Illinois	237,181	379,490
Indiana	205,126	328,202
Iowa	213,439	341,502
Kansas	165,286	264,458
Michigan	196,447	314,315
Minnesota	178,478	285,565
Missouri	263,004	420,806
Nebraska	124,417	199,067
North Dakota	77,690	124,804
Ohio	256,695	410,712
Oklahoma	191,988	307,181
South Dakota	74,637	119,419
Wisconsin	189,295	302,872
Heart States Total	2,373,683	3,797,893

In the cities, it is quite true that the motorcycle is regarded more as a delivery than as a pleasure vehicle. On the farm, altho it is a utility vehicle, it is nevertheless regarded as a pleasure machine. There is comparatively little data to show that farm boys and men are buying motorcycles in large numbers. We are convinced that the pleasure appeal should take precedent over the utility appeal when advertising to farm boys.

We do not feel that the utility appeal should be entirely disregarded in appealing to farm boys, however. The majority of boys over sixteen on the average farm are living with their parents and working with their father on the farm. The utility appeal will give the son a pretty strong argument for the purchase of a motorcycle.

If you have ever lived on a farm, you undoubtedly know that during haying and harvest and the busy seasons of the year, a broken part on a piece of machinery may hold up the entire crew. This is especially true of a harvest or threshing machine. A broken part on the binder or a broken casting or another part in the separator will hold up the farmer and his hired men, and his neighbors who are trading work.

The motorcycle can be used to secure such hurry-up repairs. It can also be used to deliver poultry, eggs, cream and all sorts of small farm produce, as well as to obtain emergency supplies from the nearest market.

There are, as you of course know, a large number of motorcycles in use, many of which are probably owned in farmers' families.

C. A. BAUMGART,  
Bureau of Farm Market Analysis, *Successful Farming*.

## Finish of Closed Car Interiors

Editor, AUTOMOTIVE INDUSTRIES:

The writer went over the article on closed car bodies published in your Nov. 24 issue, very carefully, and was very much interested in it.

There is no question whatsoever but what there is a growing demand for the cars equipped with a low-priced closed body. No line is complete without it. We feel sure that the very near future will bring forth many low-priced closed bodies, and from what we have seen we would say that no attempt has been made to stint the little refinements and accessories that go to make the closed body desirable. Probably one of the most important points that will require attention in this type of body is weight, as the power plant and chassis designed correctly for the open car is sometimes inadequate for the closed car.

We believe that the future will bring out the type of body that will eliminate upholstering with the exception of seat cushions and backs. By this I mean the interior

of a closed car should appear very much as the finish of a pullman car smoker, where we find imitation mahogany throughout with the exception of the seats and the seat-backs.

This would eliminate the present necessity of waving a vacuum cleaner around one's head in order to clean the interior, the cleaning being done by the application of a damp cloth. This would aid in the elimination of some considerable expense, we believe.

ALEX TAUB, Engineer,  
General Motors Corporation.

## Thin Top Leaves for Springs

Editor, AUTOMOTIVE INDUSTRIES:

The article, "A Remedy for Spring Breakage," by Frederick Franz in the issue of Nov. 10, interested the writer as he is the inventor of a leaf spring in which the master leaf is thinner than the other plates. Springs of this description have been in use by several automobile builders since 1915. We may mention a few here: Dorris, National, Crane, Mercer, Simplex and Marmon; the last-named maker's cars have been regularly so equipped since 1914-1915.

When your correspondent states that a "Chicago spring maker almost refused to supply me with springs for an electric truck—having the top leaf thinner than the remaining leaves" on account of the "unusual procedure" it may have been that the said spring maker was well aware of the existence of U. S. Patents No. 1,199,013 and 1,199,038 issued Sept. 19, 1916, and No. 1,241,744 of Oct. 2, 1917. These patented springs, known as the "Sheldon-Landau" springs, are manufactured exclusively by the Sheldon Axle & Spring Co. of Wilkes-Barre, Pa.

It may be of interest to the automobile industry in general to know that during the past six years in which these springs were sold—there are at least 70,000 in service—not one case of main plate breakage has been reported. It should be said, in due justice to truth, that springs can be made in which the main plate is thicker than the other plates, or as thick as the other plates, which may be used for the Hotchkiss drive which will not break the main plate, but such springs will be short lived. Per contra, such springs may be made to have as high an endurance as the Sheldon-Landau type, but they will be exceedingly heavy.

The real cause of main plate breakage in any leaf spring is not due to the Hotchkiss drive alone, for the same thing happens to springs that do no "driving." The cause is quite deep seated and this is hardly the place for a discussion of the problem; the patents named will give one a practical exposition. To any one seriously interested it may be said that, a serial paper entitled "A New Theory of Plate Springs" by the undersigned and P. H. Parr, published in the Journal of the Franklin Institute, during 1918-1919, gives a complete scientific exposé of the problem your correspondent has but lightly touched upon.

DAVID LANDAU,  
Sheldon Axle and Spring Co.

THERE is a law in Mexico which greatly limits the sale of runabouts and coupes, according to the Ford Motor Co. This law states that an automobile cannot remain standing on the street without some person being in the driver's seat. Many car owners carry a little Mexican boy about with them. This boy rides in a bucket seat on the rear fender. When the owner leaves the car, the boy gets up into the front seat and acts as a watcher. The law was brought about by the great number of automobile thefts during recent months.

# Qualifications of Employees Must Be Developed

Many individuals have potential capacities and capabilities which have never been brought to light because the opportunity was never offered. Much attention has been paid to the selection of men, but too little to their development. Qualities of an individual vary with his experience.

By Harry Tipper

NOT long ago I was invited to attend a meeting of managers of large concerns who met at stated times in executive sessions to discuss intimately the problems of management. This particular session was devoted to the selection of men. The discussion was very vigorous and generally indulged in by the group. The main discussion turned upon testing and examination which would indicate the qualities possessed by the man and their applicability to the particular positions under consideration. A good deal of experience was given as to the working of these tests and methods of standard examination and there was evidently a general feeling that some tests or standards were necessary and apparently most of the managers were employing methods of this kind.

Through all the discussion, however, there was a suggestion of futility. The whole matter seemed to rest upon so slim a foundation that the superstructure of discussion and operation was too heavy for the foundation that had been assumed. Not a single speaker realized that the foundation upon which his tests and examinations were built was assumed without sufficient supporting evidence and should have been subject to the same critical consideration that was being given to the methods.

The man who introduced the discussion, evidently an able man, had led with a list of qualities under about one hundred headings and four hundred subject divisions. The reason for this list was not indicated and the writer was left completely in the dark as to its origin and definition. Furthermore, the qualities were accepted as though human beings either possessed these qualities or did not. Any stranger listening to the discussion would have been justified in supposing that initiative, personality, accuracy, and other mental qualities were definite, measurable and fixed—almost like so much property or so many tangible possessions of which it may be said that one either has them or does not have them. There was no indication of any idea that qualities grow and wane, that the same fundamental quality varies not only by degrees but in the direction of its skill and that the development of the qualities as well as their direction is largely due to the surroundings, the character of the activity and its specialization.

This was the more astonishing because we have all seen youths of procrastinating decision become men of force and capable of continually deciding upon the adoption of operations. Similarly, the boy who was poor in mathematics in his college training may become expert in the use of the mathematics required for his business.

All the qualities vary even in the same individual at different stages of his experience. As the responsibility is put upon him, the experience of handling that responsibility brings into play new qualities and develops new characteristics.

It is true that when a man has reached his middle life, under ordinary circumstances, his habits of action are sufficiently stabilized to indicate his probable worth from the standpoint of his qualities. It is also true that the average value grows as the individuals themselves grow and we will get better machinists, better salesmen, better executives as we improve the opportunities for the individuals to develop and raise the general average.

In this whole discussion, however, no attempt was made to consider the variation of qualities in the same individual and consequently to realize that the qualities exhibited are the effects of the man's action; they do not govern the man's capacities, but arise out of the expression of the man's capacities in his reaction to his responsibilities and surroundings.

No attempt was made to consider the development of men and yet the entire efficiency of business depends upon the development of more capable, skillful, accurate, adaptable workers with greater understanding, better judgment and more effective powers of decision.

This group of men represented forward looking, studious managers who are intensely interested in solving the problems and for this reason their attitude upon this point is illuminating as it suggests the general attitude in business. One of the ablest of the old leaders in business said that a true executive should be able to take any healthy individual, mentally and physically normal and with an ordinary education, and produce a good worker therefrom.

A larger measure of preparatory education is necessary for larger responsibilities, perhaps, but the old leaders of business who built American business from small, insignificant and crude beginnings could show very little education amongst them, and their associates and younger subordinate officers were in the same category. About all these men had was normal physical and mental health and an eager desire for activity. All the other qualities they acquired from the necessities of their experiences.

How are we to improve the present structure of business and its efficiency unless the modern leaders are capable of doing the same thing—that is, developing the potential capacity of the individual and producing a larger efficiency because of that development? These managers have not yet secured a full vision of the responsibility of their position when their discussion as to the selections of men are confined to the discovery of men with capabilities already developed, with little appreciation as to how the development of these capabilities takes place and with little consideration of the development of men by the efficiency of their own leadership and work.

An investigation made in connection with the offices of several lines of industry for the benefit of one of the universities indicated a great reluctance on the part of the employers in these lines to hire boys from the universities without experience. Almost all these concerns wanted their men ready made for them and one of their complaints about university education was that the men were not ready made for their organization when they got through.

It would be interesting to discuss how we are to keep industry going if the concerns are unwilling to accept into their organization untrained material and develop it. It would be interesting to determine the increase in the difficulty of securing employment on the part of those leaving school and college because of their lack of experience, but that determination would lead somewhat too far afield to be of moment in an article of this kind.

It is discouraging, however, from the standpoint of an industry to find so much discussion of the selection of men and only a small comparative consideration to the development of men. Even where the development of men has been given some consideration, the responsibility for that development has been unfortunately shelved by the transfer to a school or a training department, so that the operating officials would not be required to study leadership of this type.

It must not be forgotten that for 90 per cent of the people the great educational factor is the employment. It is the work which develops the capacity, emphasizes the knowledge and augments the power to accept responsibility. Only a comparatively small number of the individuals leaving school have any marked desires or any marked talents in a particular direction. Most of them are still forceful only in *potentia*, and their potential capacities will be developed into visible qualities of action as they are used in industry. Not only is this the case but the attempt to provide methods of examination and methods which will measure the capabilities of the man is not entirely without danger in the present state of our knowledge.

Even the terms used are so indefinite that observations made in respect of these terms must vary in accordance with the understanding of the individual observer. A speaker not very long ago in talking about the qualities which were desirable for a certain line of occupation referred to a voluminous thesaurus at his elbow and said that this was the most valuable book from which to arrive at a proper understanding of these qualities, but no thesaurus nor dictionary is expected to define terms. By the substitution of other words in commoner use, and by

explanation of derivations or past meanings they describe the limitations to be considered in the use of the word in any connection. There is a vast difference between description and definition. Definition consists in the discovery of the principle underlying the tangible results or effects and the statement of its character and application. No definitions have yet been made of human qualities which would enable two or three observers to arrive at the same conclusion therefrom. The sales manager says he must have somebody with initiative, yet he does not take a research man, although of all men the research man must initiate more than any one else. Practically all his work is initiating or starting something so that he can discover its relation to other matters and more of the facts concerning it. The initiative in the understanding of the sales manager is a different quality than the one displayed by the research manager and it is useless to adopt a term which can express such different ideas as a standard by which to measure.

It is true that we require for the work of machinist a man with the developed skill to handle machinery or else we must be prepared to devote a certain amount of time and effort to the development of that skill in the youth. The other qualities we demand, the qualities we class indefinitely by the terms loyalty, persistence, etc., we have no right to demand unless we have taken means to develop these qualities in the educational system through which these men must pass.

If we are to gain the respect, to develop the loyalty, to secure the persistent effort and the interest of these workers, our leadership in industry must be of such a character that these qualities are developed by the very nature of the work and its surroundings. There is no escape from this, and the selection of men by the more or less standardized proceedings usual in so many factories to-day cannot weed out more than the small minority of incompetents who for one reason or another are visibly deficient in their expressed capacity.

These methods cannot build a greater general average of efficiency or secure a deeper quality, although the future of industry depends upon doing both. A character is not a fixed and determined matter. Elements of character action grow and change. No man of fifty is the same individual in characteristics that he was at twenty.

It is the business of industry to take advantage of this fact by developing not only skill but quality, so that the whole efficiency of industry will be kept moving forward at the required pace.

## New Aluminum Alloy Developed

A NEW aluminum alloy lighter than pure aluminum and said to have mechanical properties which make it superior to the ordinary aluminum-zinc-copper alloys has been developed in Germany and is being commercialized under the name silumin. It is an alloy of aluminum with 14 per cent silicon, its specific gravity (2.5 to 2.65) being about 10 per cent less than that of the most common aluminum alloys and also slightly less than that of the pure metal. The tensile strength of 28,400 lb. per square inch is from 25 to 30 per cent greater than that of the alloys mentioned, and the elongation of 5 to 10 per cent is, on the average, more than twice as great. At high temperatures silumin is also superior to the ordinary alloys in this respect. With increasing temperature the tensile strength decreases at

first slowly and then gradually more rapidly. The hardness at room temperature is 85,000 lb. per square inch (under a load of 500 kg. and a 10-mm. ball); at 350 deg., 28,000 to 35,000 lb. per square inch. Wet steam has hardly any effect on silumin, the same as on pure aluminum. Dilute hydrochloric acid (25 per cent), as well as concentrated acid, attack it less than pure aluminum. The new alloy is said to be a better conductor of heat than any other similar alloy, its conductivity being to that of pure aluminum as 4.7 is to 4. The coefficient of heat expansion is 0.88 in that of pure aluminum.

The alloy is produced by combining aluminum and silicon, but it can also be produced electrolytically. After it has been poured it is subjected to a heat treatment.—From Zeitschrift des Vereines Deutscher Ingenieure.

## The Dealer Contract

**D**EFINITE suggestions for changes in the dealer contract have emanated from a special committee of the National Automobile Dealers' Association and the N. A. C. C. The specific suggestions appear to be sound and should aid in the development of more satisfactory relationships between dealers and manufacturers.

The really important aspect of the conference which resulted in these suggestions, however, is the spirit of co-operation evinced on the part of both manufacturers and dealers. The disposition has been shown to get around a table and talk over mutual difficulties frankly and to attempt to compromise the points at issue in a manner satisfactory to all concerned. This is the significant feature of these suggestions concerning the dealer contract.

The progress actually achieved as a result of these conferences and the recommendations coming therefrom will be in direct proportion to the desire of individual manufacturers to carry out the suggestions and to put into their dealer relationships the spirit

of honesty and co-operation which must have been the genesis of the conferences. Friction in relations between dealer and manufacturer is a potent factor in increasing marketing costs. The business period which the industry is entering demands efficient merchandising.

## Reduce Closed Car Costs

**A**N analysis of present closed body prices is significant in light of the movement toward lowering the price differential between open and closed models. The following figures show the percentage difference between open car and sedan prices in cars of four price classes. In making this compilation those cars were considered which fitted into a given price class in both open and closed models.

Cars under \$1,000.	
1920 prices .....	83%
1921 prices .....	64%
Cars \$1,000-\$2,000.	
1920 prices .....	55%
1921 prices .....	62%
Cars \$2,000-\$3,000.	
1920 prices .....	42%
1921 prices .....	49%
Cars over \$3,000.	
1920 prices .....	29%
1921 prices .....	31%

These figures show that in all except the lowest price class, the differential between open and closed body prices has increased. Thus the trend in prices appears to be in direct opposition to the trend in buyers' demand. Even in the low-price class, where the trend is in the right direction, the absolute percentage difference is still greater than in any other case.

There is a growing demand for lower priced closed cars. The public is sold on the all-year-round vehicle, but many prospective buyers cannot or will not pay 50 per cent more than for an open car. The problem facing the body designer and the body production engineer is to produce a closed body which can be sold at a price reasonably near that of the open job.

## Government of Civil Aviation

**T**HE Governments of the various large industrial countries seem to be agreed that it is for the national good to foster the development of aircraft. If not as much has been done along this line during the past three years as would have been desirable, it is probably due to the fact that most of these Governments have had very difficult and pressing problems to face and there has been in all countries a strong demand for financial retrenchment.

Practically the only country in which aircraft development has enjoyed consistent Government support is France. The service between Paris and London is maintained with the aid of a Government subsidy, and similar services with Government aid are now planned to connect Paris with Warsaw, Constantinople, Stockholm and Algiers. In England not much of a definite character seems to have been accomplished so far, though some very ambitious schemes

were put forth at different times. It is only necessary to refer to the Cape-to-Cairo air route, which was said to have been practically completed about a year ago, and to the England-Australia flights which were to be the beginning of a regular British Empire air service. Both projects failed of realization because of their over-ambitiousness. Now the British Air Ministry seems determined to make a new start in fostering civil aviation, on a more rational basis, for it has been learned that an experimental machine designed for carrying heavy loads is being built for the account of the Ministry at the plant of the Bristol Aircraft Co. The machine in question will have a carrying capacity of 3 tons, and it is the intention of the Ministry to make use of it in an experimental way to determine the actual costs of aerial transport. There are enthusiasts who maintain that these costs can be brought down as low as those of automobile transport.

## What Will the Show Bring Forth?

**T**HE New York show has a special significance this year since it is sure to be the scene of many interesting developments. In a certain sense it will probably be a signal for a new start. Present selling conditions are not favorable because there is a well-substantiated rumor throughout the industry which prophesies another flurry of price cuts at the New York exhibit.

As a result dealers are working hard to clean out stocks of old models, but are being hindered because the public as well, to a certain extent, has caught the price-reduction rumor waves. The immediate situation is one of uncertainty, a condition which will probably remain until Jan. 7. It is sincerely to be hoped that if another readjustment of prices takes place, a definite effort will be made to set the new prices upon a sound economic basis, that reductions will not simply be another slice lopped off by-guess-and-by-gosh.

An exceptionally large number of new models will be another feature of this year's show. Most of the newcomers will be in the group which sells for less than \$2,000, many of them nearer the \$1,000 class. There will be a number of entirely new models put out by firms already established, and there will be, in addition, a number of new cars made by new companies. The trend shown by new cars, however, is directly in line with the marketing economics of the present situation, which indicate that nearly 95 per cent of the cars made in the future will sell for less than \$2,000.

There is a general feeling that prices of parts and supplies have gone about as low as they will for some time to come, and it is devoutly hoped in all quarters of the industry that whatever price reductions or "readjustments" which remain to be made in the selling prices of completed vehicles will be announced at the shows so that the industry can be stabilized and dealers can go ahead with the confidence that there will be no more cuts, at least for months to come.

Prospective purchasers generally are waiting for cuts expected after Jan. 1.

## Unthinking Criticism of Standardization

**M**OST engineers are strong advocates of standardization, but occasionally we hear a violent protest against such and such an attempt at standardization based upon a feeling that something is to be done to destroy initiative, or the power to create something new. One engineer recently said in effect that we might as well build a standard car and be done with it. This is a good example of unthinking criticism. No general scheme of standardization aims at such a thing or anything remotely resembling it. If it did it could never succeed.

Truly meritorious developments in engineering cannot long be held back by reason of the existence of standards, and the engineer's ability to create will always find opportunity for expression, but such creative work should always be done with due regard to its effect upon the community of interests and not solely with a view to benefiting a single individual or a small group of individuals. The introduction of a special size or type of part into an automobile, for example, may conceivably prove a direct benefit to the manufacturer and even the purchaser, so far as first cost is concerned, and still not benefit either, in the long run, because it introduces service difficulties and expense and adds just so much more to the burden of carrying another special part.

On the other hand, standards which have become obsolete as a result of improved methods, especially in the automotive industry, are not difficult to change. In other words, the industry is quick to adopt new developments which are of evident benefit to all concerned, and no other type of development can hope to be successful in the long run.

Among the concerns which have made the most conspicuous success in the automotive industry are those which have adhered rigidly to the production of what, so far as they are concerned, is a highly standardized product, and this success is in no small part due to the fact that both manufacturer and purchaser have profited by standardization.

## May Your Ship Come In

**W**E pass on to you this sincere Christmas message, which has been sent by one manufacturer to his dealers, since it conveys so aptly the wish AUTOMOTIVE INDUSTRIES has for its subscribers this Yuletide:

"Somewhere on the waters a ship is sailing. It is the vessel you dream of as your ship. Sometimes it seems far out at sea, tossing about in its battle with the waves. At other times you can almost see it coming safely and majestically into the harbor, with full sails and flying flags.

"'When my ship comes in' is an expression that we all have used some time or other, little thinking that this very ship might be sailing in a straight course into port, with anchor ready to drop. And our wish to you is that your ship will come in by the twenty-fifth of this month, bearing Christmas tidings of joy and happiness for you."

# Report Commends Motor Vehicles

## Improve Standard of Living on Farms

### Joint Commission of Congress Deduces Recommendations from Recent Inquiry

Washington, Dec. 19.—Indisputable testimony as to the essentiality of motor vehicles is given in the first section of a report of the Joint Commission on Agricultural Inquiry of the Sixty-Seventh Congress which was filed this week.

The commission strongly recommends that better roads to local markets and improved joint facilities at terminals for connecting rail, water and motor transport systems be developed with a view to reducing the cost of marketing and distribution.

The influence of the automobile on farm life is described by the commission as follows:

"The automobile with good roads will help make larger rural community centers possible, and hence as choice recreational and social opportunities as smaller cities and most larger cities will offer. A better standard of living in the country should be a cost factor to be reckoned with in future farm prices."

The commission then goes on to say:

"Another element of importance in the cost of production is the increase in outlay necessary for machinery and equipment. In agriculture, as in industry, machinery has more and more taken the place of hand labor.

### Crops Must Meet Costs

"The outlay for the necessary farm equipment and machinery should ultimately be paid for out of the products of the farm, either in increased output, lower unit costs or in higher money prices. There is nothing in the history of the development of agriculture in the last 30 years which indicates that either the interest on higher farm values or the increase in cost of machinery and equipment is likely to be paid for out of the increased production. To the extent that they can not be paid for out of increased production they must be paid for out of higher money prices or in lower unit costs if the standard of living on the farm is to be maintained.

"About 31 farms (30.7) out of every 100 now report automobiles. Automobiles were reported for more than half the farms in Nebraska, Iowa, Southern Dakota, Kansas, Minnesota, North Dakota, California and Illinois.

"The extent to which investments in tractors, trucks, automobiles, and other farm machinery are justifiable in reducing the cost of production by increasing quantity output or increasing efficiency of production is a problem which must be solved with reference to the conditions existing upon each farm. No general conclusion upon this

## SAMSON TO PROCEED WITH HOME BUILDING

JANESVILLE, WIS., Dec. 19.—An order from headquarters of General Motors to the Samson Tractor Co. of Janesville, Wis., to proceed with the completion of 54 dwellings erected two years ago but not finished, is regarded as indicative of enlarged operations in the near future based on improvement in the tractor and implement business.

question can be arrived at without more data than it is possible for this commission to obtain in the limited time available to it.

"Considering the entire question from the standpoint of agricultural as a whole, due consideration must be given to the necessity and desirability of increasing satisfaction and conveniences of farm life within the limits of the economic rewards which the industry should afford those engaged in it.

"The expansion in the use of machinery has brought expansion in the size of farms. We have competed with the world in agricultural production by increasing output per unit of labor as distinct from output per acre. The number of farms increased but 1.4 per cent in the last decade. The average acreage per farm increased from 138.1 in 1910 to 148.2 in 1920, or 2.9 per cent."

Quite significantly the commission says:

"On the whole, it seems probable that increased production of farm products in this country must be at the expense of increased costs. There is nothing in the study of the development of agriculture for the past 30 years which justifies a conclusion that greatly increased fixed charges resulting from higher land values, greater indebtedness, larger outlay for equipment and machinery, fertilizer, labor, and greater satisfaction and conveniences in country life, can be paid for out of either increased production per man or per acre. Payment of these increased costs must come out of larger money returns, and these are dependent for the most part upon better organization and more efficient marketing of farm crops."

## Shuler Creditors Accept Compromise on Claims

LOUISVILLE, Dec. 19.—A majority of the creditors of the Shuler Axle Mfg. Co. have agreed to accept a compromise of 80 per cent on claims at a hearing before Judge George A. Brent, referee in bankruptcy. Preferred claims against the company, such as wages of employees and taxes, will be paid in full.

The accepted compromise of creditors will be certified to the Federal Court of this district for final action after which the company's assets are to be turned back to the corporation. Reorganization steps will be taken, it is stated.

## Overland Planning Full Force in 1922

### Bock Bearing Anticipates Increased Business—Auto-Lite Corp. Optimistic

TOLEDO, Dec. 19.—The first indications of the intention of the Willys-Overland Co. to take on a full force in its plant here in 1922 was given this week when it was announced that the forces in the tool and die room would be trebled and advertisements for sheet metal die-makers and experienced automobile tool-makers were sent out. The plant will close from Dec. 22 to Jan. 3 for inventory.

It is planned to have 12,000 men at work at the Overland plant by March. The January schedule is 7500 cars and for February it is 11,000.

The Chevrolet Motors Co. plant here closed Saturday until Jan. 1, releasing about 400 men for the holiday season. Vice-President E. D. Moore said the shutdown was only temporary and for the purpose of taking inventory. Some new machinery is being prepared for the rush of orders expected early in the new year.

The Bock Bearing Co. is anticipating about 10 per cent increase in its business for January and a gradual increase of about that much each month until next fall, when the business will be back to its normal. In January operations will be about 30 per cent of normal. President R. E. Clingan states that many automobile manufacturers will place orders after the New York and Chicago shows.

The Electric Auto-Lite Corp. reports its business as showing an increase and being considerably better than at any time during the year. The prospects for 1922 are the brightest in its history.

## Metz Co. Reorganizes and Changes Its Name

WALTHAM, MASS., Dec. 19.—Official announcement has been made that the Metz Co. has been reorganized as the Waltham Motor Manufacturers, Inc. The new corporation is offering \$500,000 in 8 per cent cumulative preferred stock at \$10 par plus 100 per cent bonus in no par common.

The capital authorized and outstanding after the financing plan will consist of \$2,500,000 in preferred and 1,000,000 shares of common. The name of the Metz car has been changed to the Waltham and the company proposes to manufacture a new type of automobile body in addition to the car.

# Plants Close for Inventory Taking

## Will Resume Jan. 3 on Old Schedules

### Car Manufacturers Confident of Steady Expansion as Year Progresses

NEW YORK, Dec. 20—Most of the manufacturing companies in the automotive field will take advantage of the holiday period to take their annual inventory. All of them are preparing, however, to resume operations Jan. 3, on schedules fully as large as those now in force, and are confident that it will be necessary to expand their output steadily as the new year progresses. It is almost universally true that the inventory position is much more satisfactory than it was a year ago. Most companies have taken their losses and many of them have balanced the supplies on hand.

The belief is general among parts manufacturers and those who supply car and truck manufacturers with materials that substantial orders will be given very soon. Rock bottom prices are being given on materials ordered at this time and it is improbable they will go much lower for a long time to come. Some of the parts manufacturers are quoting prices which will allow them only a very small margin of profit, in order to operate their plants more nearly at capacity.

The subject of costs is one which is being given exceedingly careful attention in all branches of the industry. Competition is keen, and manufacturers realize that purchasers must be given greater value for their money. Every effort is being made to effect economies in factory production costs and to keep down overhead expenses. One of the means to this end which is being taken up seriously by the larger manufacturers is the elimination of distributors and direct relations with dealers through factory branches.

Another important trend is toward the development of light cars of high quality. Some of the newcomers in the field propose to meet this demand with six-cylinder cars of good body work and excellent material throughout. Some of the older manufacturers who have specialized in heavier cars will expand their lines to include lighter models. This would give an excellent argument to the manufacturer who proposes to insist on having

### CITIES THAT OFFER BEST SALES FIELD

BOSTON, Dec. 19—Under the heading of "Sales Opportunities," the United Business Service lists the following as the best cities in which to make sales in January:

Baltimore, Birmingham, Charlotte, N. C., Cheyenne, Wyo., Dayton, Detroit, Fall River, Grand Rapids, Knoxville, Tenn., Lawrence, Mass., Los Angeles, Lowell, Mass., Manchester, N. H., Mobile, Nashville, Tenn., New Bedford, Oshkosh, Reading, Pa., Richmond, Sacramento, South Bend, Ind., Tacoma, Toledo and Washington, D. C.

his dealers handle his own lines exclusively. If he can provide a dealer with both a light and a heavy car he will contend there is no reason why he should take on another make. A large number of these new models will be displayed at the New York and Chicago shows.

As the year comes to an end it has become certain that production will exceed the most optimistic forecasts at the beginning of the year, and the most careful estimate still stands at approximately 1,700,000 for American producers of passenger cars and trucks. This record has been exceeded by the industry in only three years and it is only about half a million less than in 1920.

The outlook for production and sales in 1922 continues problematical. Most manufacturers believe business will be better, but many of them hold to the belief that sales, especially of passenger cars, will not be much larger in 1922 than they have been in the past year. The outlook for truck sales, however, is more promising, and the market will expand gradually as general business conditions return to normal.

### BAKER SCHEDULE INCREASED

EVANSVILLE, WIS., Dec. 19—The Baker Mfg. Co., a large producer of farm gas engines, has increased its working schedules from three days a week to six days a week, 8 hours a day. A horizontal decrease in wages amounting to 25 per cent has been accepted by all employees under this plan. The betterment in orders and improved outlook are responsible for the enlargement of output, which is the first in about ten months' time.

## Duplex Exhibits New Rail Vehicle

Weights 10,000 Lbs. with Forward  
Speed of 45 Miles  
an Hour

DETROIT, Dec. 17—Duplex Truck Co., Lansing, exhibited at its stockholders' meeting this week a new gasoline-driven motor car designed for use by railroads for short hauls and branch line work. The rail car is in a way supplementary to the special bus model developed by the company which has been adopted in many communities during the year for street and road transportation.

President Harry M. Lee in introducing the new vehicle said its low operating cost would enable railroads to amplify their service on branch lines, and, probably, be instrumental in causing new lines and extensions to be built.

The car weighs about 10,000 lbs. and has a forward speed of 45 miles an hour and reverse speed of 25. The front end of the car is supported by a four-wheel truck with brakes on all four wheels and also on the rear wheels. The power drive is worm and ring gear. One-man operation is provided and there is seating capacity for 32 passengers. Separate batteries are used for starting and lighting.

Special design bodies will provide for cars acting as both passenger and freight carriers. Separate trailers for freight and baggage can also be used where volume is large enough to warrant, the speed of the car being little diminished by use of the trailer. It is also pointed out that the car could be used for emergency service on street railway lines where infrequent service makes electric power uneconomical.

## Gasoline Stocks Reduced 59,000,000 Gallons

WASHINGTON, Dec. 19—Refinery statistics compiled by the Bureau of Mines for October show that stocks of gasoline were reduced 59,000,000 gallons during the month. However, the stocks of gasoline on hand Oct. 31 consisted of 155,000,000 gallons in excess of those on the same date of last year.

Domestic consumption of gasoline increased by 17,000,000 gallons, as compared with September, and exports increased 12,000,000 gallons. Shipments to insular possessions decreased 3,000,000 gallons. The daily average production of gasoline for October increased 327,000 gallons, as compared with the production for the previous month, making the daily average output 14,224,372 gallons.

## May Change Method of Engine Stamping

### S. A. E. Committee Recommends Alteration of Numbering to Curb Thefts

NEW YORK, Dec. 19—Recognizing that the first step the automobile thief takes in changing the identity of stolen automobiles is to alter the engine number so that the automobile engine cannot be identified, the engine division of the Society of Automotive Engineers, at the suggestion of automobile insurance companies, has recommended revisions in the method of numbering engines which was approved for general use in 1916. The revisions proposed are believed to be the simplest, most effective and practical system for numbering engines which has been devised for protecting automobiles against theft.

#### Position Moved

These recommendations provide that the engine serial or identification number shall be placed near the top of the right-hand side of the crankcase proper in a position in which it can be read easily. It shall be between two vertical ribs of beads  $\frac{1}{4}$  in. wide,  $\frac{1}{2}$  in. high, 3 in. long and 3 in. apart. The surface of the casting between the ribs shall be left rough as cast and unpainted on the finished engine. The numbers shall be evenly stamped in the casting  $\frac{1}{32}$  in. deep and shall be  $\frac{1}{4}$  in. high and of script form.

The first digit shall be stamped close to the left hand rib and the last digit shall be followed by a large star or other character to prevent adding digits. A star or other character also shall be stamped immediately above and below each number to prevent adding another number. The number shall be stamped twice on each casting to permit correcting any errors made in stamping either number. No other number or character shall be placed within the space provided.

By this method in case an error is made in stamping either number, an additional number would be stamped directly under or above the number, the number stamped in error being cancelled by stamping a horizontal line through it. In this way two correct unmutated numbers would appear on each engine.

#### Provision Made for Errors

In case errors were made in stamping both the original numbers, the casting would be scrapped as the system requires at least one of the two original numbers shall be unmutated in any way.

The recommendation will be acted upon at the standards committee meeting on Jan. 10.

It is understood that a 7½ per cent reduction in theft insurance premiums will obtain if a method of numbering engines is adopted by the society as standard which would conform with the Underwriters Laboratories' requirements.

## MOLASSES IS USED TO TEST GASOLINE

MILWAUKEE, Dec. 19—Little dabs of cheap molasses on plain pine sticks in the hands of oil inspectors in Wisconsin have saved users of gasoline thousands of dollars this year. This simple test to discover water in gasoline was first used in Minnesota, but has been adopted as an official means of testing by the State oil inspector's department of Wisconsin.

The theory is that water is heavier than gasoline and always sinks to the bottom. A stick dipped in cheap molasses glides through gasoline without showing any effect on the molasses. But when water is encountered, the molasses comes off the stick. When the stick is withdrawn, the exact amount of water in the tank is clearly revealed by the discolored fluid.

The recommendations resulted after a careful review of present practice, soliciting suggestions and comments from insurance companies, automobile and engine manufacturers and metallurgists in reference to methods of numbering engines. The majority of the replies indicate preference for plain figures about  $\frac{1}{4}$  in. high deeply stamped into a pad or plain surface cast on the engine.

Among the several suggestions received as a means for preventing engine numbers from being changed were casting a pad of special alloy steel in the engine crankcase on which the engine numbers might be stamped, casting numbers of an opaque material in a cylinder block in such a way that X-ray photographs would show the numbers, using raised numbers and casting on a small thin brass plate with edges crimped down  $\frac{1}{8}$  in. and knurled so as to anchor the edges securely in the crankcase, the number being stamped in the brass plate in the usual way.

## N. A. C. C. Names Jordan in Safety Promotion Work

NEW YORK, Dec. 19—Edward S. Jordan, president of the Jordan Motor Car Co., has been appointed special representative in traffic and safety by the highway committee of the National Automobile Chamber of Commerce. He has been actively engaged in the promotion of safety work with relation to the highways.

"Education saves lives of children," Jordan says. "We can accomplish most by working through the schools. We must speak for severe penalties on speeding and careless driving, but we can bring about the best results in training the children in safe behavior on the streets and providing playgrounds for their leisure hours."

## Goodyear Making Navy Balloonettes

### Will Be Used as Gas Containers for American Constructed Dirigible

AKRON, O., Dec. 19—Eighteen large balloonettes to be used as gas containers in the ZR-1, which will be the first rigid dirigible airship to be constructed in America, are being made for the navy department of the United States Government by the Goodyear Tire & Rubber Co.

The balloonettes will range in size from 200,000 cubic foot capacity down to 18,000 cubic feet. The government order calls for their delivery by July 1 to the navy hangar at Lakehurst, N. J. The hull of the ZR-1 is being made at Philadelphia.

In the manufacture of the huge gas containers, "Gold-beaters' skin" is being given its first extensive use in this country for the manufacture of balloon fabric. The material is the blind gut taken from the intestines of the steer. It was originally given the name of "Gold-beaters' skin" by reason of the fact that goldsmiths used the skins in making gold leaf by placing sheets of gold between the layers of skin and hammering into the filmy gold leaf.

#### Use Steer Intestines

Parts of the intestines of nearly one million steers will be used in the manufacture of the balloonettes. The use of the skins was first employed in Europe, never prior to this time having been extensively used in the United States. Goodyear is placing orders for the skins with all big packers in the country. They are being received in Akron packed in salt.

The membranes are soaked, cleansed and scraped and when dried each skin measures about 20 inches in length and eight inches in width. The skins are cemented together by a secret process and then are cemented over rubberized fabric and coated with shellac, forming a tough and slightly elastic lining for the gas containers.

The largest of the ZR-1 balloonettes being made by Goodyear is equivalent in gas capacity to that of the largest dirigible hull ever manufactured in this country. In other words, one of the ZR-1's eighteen balloonettes will be as large as most of the navy and army dirigibles of 200 foot length now in commission.

Goodyear is putting on a force of 300 girls and women to prepare the skins for the gas containers.

#### ASK BANKRUPTCY FOR AERO

NEW YORK, Dec. 19—An involuntary petition in bankruptcy has been filed against the Aero Motor Corp. by three creditors with claims aggregating \$23,000. They are Gio Ansaldo & Co., \$19,296; Wright Aeronautical Corp., \$3,300; P. Brady & Son Co., \$895. It is stated that the corporation has admitted its inability to pay its debts.

## Curtiss Airplane Claims Sustained

### Court of Appeals Finds He Was First to Build Hydro Machine

NEW YORK, Dec. 19.—The final chapter in one of the longest legal controversies ever waged in this country over the development of flying machines was written in the United States Circuit Court of Appeals for the second district when a decision was handed down upholding the claim of Glenn H. Curtiss that he was the first to build a flying machine which arose from and alighted on the water.

The suit was brought to establish the right of Curtiss to a broad patent on the hydro-airplane, and the circuit court decision reverses a ruling of the United States district court for the eastern district of New York in the case of the Curtiss Aeroplane & Motor Corp. and Glenn H. Curtiss against Albert S. Janin of the Janin Co., Inc. The decision was signed by Judges Hough, Manton and Mayer.

#### Controversy Started in 1911

The prolonged legal controversy grew out of an application for a patent filed on Aug. 22, 1911, by Curtiss, who, on Jan. 26 preceding, had demonstrated his flying boat in the harbor of San Diego, Cal. His successful flight with an air machine equipped with a boat hull structure and wings buoyed with small pontoons was made on the same day that Janin filed his application for what he described as a land, water and air machine.

The opinion of the court, written by Judge Hough, holds that when Curtiss made the San Diego flight he then succeeded in reducing to practice the theory of his invention, which entitled him to the broad patent thereon inasmuch as Janin's invention, at the time of this flight, and even later when the application of Curtiss was filed, had not advanced beyond the theoretical stage where it was described on paper, and that the mere description did not constitute a reduction to practice, since it was never proved and was unlikely to be proved, that Janin's plans would enable another person to build a hydro-airplane that would work with success.

#### Janin's Invention Considered

In this case, reads the opinion, we feel sure that defendant's constructive reduction to practice received no assistance from any previous conception on his part; and this is true even if full credence be given to defendant's evidence as to his early drawings, models and experiments and no weight be attached to plaintiff's testimony tending to show Janin as one unworthy of belief.

The reason for this holding is that whatever Janin conceived prior to Jan. 26, 1911, whatever experiments or models he made, it is admitted that the ripe fruit of all that he had done was contained in the specification he then filed. If, therefore, that specification does not enable the man skilled in the art to construct without further exercise of the in-

## OLDEST AMERICAN CAR IN COMMISSION SOUGHT

NEW YORK, Dec. 19.—Search has begun by S. A. Miles, manager of the New York and Chicago automobile shows, for the oldest automobile of standard American make still running. He wants to exhibit it at the Grand Central Palace and the Coliseum to give a chance for comparison with the cars that are manufactured now. The purpose is to show the value the purchaser of to-day is getting as contrasted with the pioneer days when motor vehicles were driven by single cylinder gas engines, known as "one-lungers."

Candidates in the contest who have knowledge of relics of olden days will be required to send details of the make of car; year of manufacture; the manufacturer's number, if possible; an estimate of the number of miles the car has run; what changes have been made and as nearly as possible the date and distance of its last run, with a photograph of the car. The show management will pay for the transportation of the owner of the car and the car itself from any part of the United States to New York and Chicago and return.

ventive faculty an operative hydro-airplane there has been no reduction to practice, constructive or otherwise.

Janin disclosed no boat body; by his own evidence he never conceived a boat body other than one like that of a swift small vessel (e.g., a torpedo boat). He speaks even in his 1913 specifications only of a 'hull-like body,' and his drawings only reveal the freeboard of something long and narrow of historic boat shapes.

The San Diego flight made by the Curtiss hydro-airplane was made possible by his development of the boat body with wing pontoons at his plant at Hammondsport, N. Y., where he was working on the water machine as early as 1910, when he flew from Albany down the Hudson to Governors Island, alighting on land with an aircraft equipped with the floating appurtenances to alight in the river. The flight down the Hudson was witnessed by thousands along Riverside Drive and from the office buildings affording a view of the waterfront.

#### OBERBERGER PLANS STOPPED

MILWAUKEE, Dec. 19.—Plans of the creditors' committee of the John Oberberger Forge Co., bankrupt, to reorganize as the United States Forge Co., have been definitely stopped by order of Referee John F. Harper, who refused a further extension of 10 days to accomplish the reorganization and directed the immediate sale of the property. J. Frank Gerdis, trustee, says that unsecured creditors will net about 10 per cent. The next meeting of creditors will be on Jan. 4.

## Canton Forge Plant Sold for \$293,500

### Purchasers, According to Stipulations of Sale, Will Continue Operations

CLEVELAND, Dec. 19.—Terms on which the Canton Forge plant, which is a subsidiary of the \$20,000,000 Standard Parts Co. of this city, were sold, became known when Federal Judge D. C. Westenhaver approved the private sale.

The purchasers are Fred A. Poore and Phillip Poore, president and vice-president, respectively, of the P. & M. Co. of Chicago. The price was \$293,500. They are to pay \$50,000 cash. The balance is to be covered by promissory notes to be paid Jan. 1, 1923. It is stipulated that the purchasers are to organize a new company to operate the plant.

At the time that he approved the sale of the forge plant, Judge Westenhaver directed that the remaining unused machinery and fixtures in the American Ball Bearing plant, another subsidiary of Standard Parts, be sold at public auction. The ball bearing plant is in this city. The date of the auction was set for some time between Jan. 15 and Jan. 30. The sales are to be for cash.

Receiver Frank A. Scott, under whose administration great progress had been made in paying off creditors and in increasing efficiency, announced the present policy is for concentration in the larger plants.

The Standard Parts is attracting considerable interest in financial circles in this city. In recent months its indebtedness has been reduced to less than \$8,000,000 from a \$10,000,000 mark on the wrong side of the company's ledger. The sale of the Canton forge and the ball bearing plants will bring into the company treasury an additional \$360,000. This is nearly enough to pay a 5 per cent dividend to the creditors.

## Propose Erecting Car Plant in Mexico City

MONTEREY, MEXICO, Dec. 19.—Considerable interest is being shown in the proposition of O. A. Larrazalo of El Paso, former governor of New Mexico, and associates, for the construction of a plant in the City of Mexico for the manufacture of automobiles. At a recent session of the Chamber of Deputies the matter was discussed at some length and the proposition was given the indorsement of that body.

The plans call for the organization of a company to be composed of American and Mexican capital. President Obregon has given an audience to the promoters and told them that the Government would give it all the aid it could. Among the other men interested in the proposed industry are J. S. Curtiss of El Paso and Adolfo P. Buquor and Alejandro of the City of Mexico. The name of the automobile that is to be manufactured will be Anahuac.

## N. A. C. C. Suggests Used Car Methods

### Questionnaires Go to Manufacturers Inviting Criticism of Report on Situation

NEW YORK, Dec. 19—A statement giving the results of the survey of the used car problem ordered by the directors of the National Automobile Chamber of Commerce discloses that the two plans most widely advocated by dealers are:

1—Independent and impartial appraisal bureaus to be established in larger cities with an agreement by dealers to accept cars in trade only at a price set by the bureau, and each dealer to sell the used cars he takes in trade.

2—Advertising by the manufacturer of the sales price of old models in good condition based on reports from the country generally. It is contended it should not be necessary to give sales values on cars less than one and a half nor more than four years old. Under this plan any dealer exceeding the allowance would do it with the knowledge that he was taking a loss. It is felt this plan would increase the respect for the used car because the manufacturer would be giving accurate information on values.

#### Exchanges Mentioned

Other suggestions made to remedy the problem include:

Used car market reports with dealers allowing the quoted market prices for cars taken in trade.

Establishment by dealers in each locality of an information bureau to make public the sales price of the various makes of used cars sold during the previous two weeks. This would be similar to the Chicago used car market report.

Used car exchanges to be maintained by dealers as a used car department, sales force and appraiser, to buy used cars from dealers, recondition and sell them.

#### Shows as a Remedy

National used car markets to provide the longest possible line of used cars for prospective purchases and supply owners with a ready market for their used cars. These used car markets could be incorporated with a wide distribution of the stock. The markets, under this plan, would issue to the owner, upon the receipt of a used car, a negotiable receipt or certificate which could be used either as collateral upon which to borrow money for the purchase of a new car or to give in part payment for such a car.

A factory rebuilding system under which cars not too distant from the factory would be returned for rebuilding.

Used car shows.

Establishment of local co-operative repair shops where cars of various makes can be reconditioned at cost.

Many plans have been tried and many more have been suggested," says the state-

ment of the N. A. C. C., but the strong outstanding feature seems to be the failure of retail automobile merchants to learn true values and to buy used cars at a price that will insure a profit when sold. No good merchant should be expected to do otherwise.

The directors are endeavoring to make this survey without bias, touching on the good and bad points of the operations of both manufacturers and dealers.

Requiring dealers some times to take their full allotment, overproduction of certain cars, rushing production to use up old inventories and giving inside trading allowances are among the things attributed to the manufacturer in developing the present situation.

Interviews with dealers prove that handling used cars could be made a profitable business provided they would, through their salesmen, educate their customers to the true value of second hand cars. Substantial dealers insist that there will be little difficulty if all dealers taking in used cars would learn not to just accept them in trade, but to buy them for resale at a profit. Make a virtue out of a necessity and buy second hand cars with enthusiasm and with the knowledge that when bought right they can be sold at a profit.

The new car market is certain to be slow until the over-supply of used cars is liquidated. With money in such stocks the dealer is financially unable to stock new cars in any quantity. It thus becomes a problem of the car maker, who is interested in helping the dealer solve the problem.

In discussing what car makers can do to ease the situation, the statement says:

Make better and fewer cars. Sell parts for reconditioning used cars at low price. Take dealers' used-car stock into account when figuring territory's potentiality. Warn dealers when they have too many used cars. Discontinue 'inside billings.' Ship only on bona fide orders instead of on monthly contract allotments. Buy in for salvage own cars over certain age.

Manufacturers are asked to send in their criticisms of the survey as early as possible together with suggestions for the improvement of the used car situation. To facilitate replies a questionnaire has been sent to each of them.

## Milwaukee Clears Decks for Steady Production

MILWAUKEE, Dec. 19—The situation of the automotive industries in this center of the parts and equipment manufacturing business is growing better steadily. More activity is noted during the first half of December than in the corresponding period a year ago. A good many concerns advanced inventory taking to the last ten days in November in order to clear the decks for uninterrupted production during December and there will be less idleness during the week from Christmas to New Year's Day than usual.

A local drop forge company now completing a reorganization reports an offer of an order which will require 60 days to fill. Foundries are making further increases in working schedules. Gray iron shops specializing in automotive castings report increases in bookings, and in shipping directions on standing orders.

## Firestone Surplus Totals \$15,813,258

### Loss of \$16,000,000 Taken During Year—Sales Aggregated \$66,372,938

AKRON, Dec. 19—After taking a loss of \$16,000,000 in inventories and tangible assets during the past fiscal year, the Firestone Tire & Rubber Co. is able to show a surplus of \$15,813,258 with \$5,888,564 in cash on hand, according to the annual balance sheet of the company issued in connection with the annual Firestone meeting. Directors declared the regular quarterly dividend on 6 per cent preferred stock, payable Jan. 15, and the quarterly dividend on 7 per cent preferred stock, payable Feb. 15. No action was taken in restoring dividends to Firestone common stock.

Firestone sales for the fiscal year ending Oct. 31, were \$66,372,938, or approximately 42 per cent of sales of the previous year which aggregated \$114,980,000. Unit sales for the past year, however, were only 15 per cent below those of a year ago, the decline in sales revenue volume being due to the series of tire price cuts enforced during the past twelve months. While dealers' business increased 2 per cent in the last year, the selling expense was decreased 38 per cent in dollars expended.

#### Bankers Express Confidence

Our inventories now are clear and are invoiced at the market or below, and now that we have no loss to take in our commitments, we must not relax our energy and determination to manufacture tires at a profit, said President H. S. Firestone at the annual meeting. Bankers who have extended accommodations to our company in the past year have expressed confidence in Firestone and have offered the same liberal banking arrangements that had prevailed in the year just closing.

Firestone reported the company had negotiated loans for \$37,252,000 during 1921, and at the close of the year had reduced this loan to \$21,600,000. In 1920 he reported the company borrowed \$43,942,000 but reduced the sum to \$31,356,000 by the close of the same year.

The Firestone balance sheet shows accounts receivable of \$12,181,114, cash on hand of \$5,888,564; inventories listed at \$12,534,369. Investments include \$3,989,055 in capital stock in foreign subsidiary companies and in stocks and bonds. Treasury stock certificates total \$129,848, while other accounts due from officers and employees of the company on their purchases of common stock, total \$5,905,424. Real estate is listed at \$30,594,721. Deferred charges are \$711,269.

The company's liabilities include \$21,680,000 in notes and acceptances payable. Accounts payable are \$2,368,276. Accrued accounts, interest and taxes are \$351,927; reserves for plant depreciation, liquidation of inventory accounts and general contingencies \$11,430,602; capital stock showing preferred 7 per cent cumulative and common, figuring authorized and issued on all classes less the unissued, of \$23,561,670.

## Engineering Staff Named for Peerless

**Anibal in Charge of Direction—  
Holden Named Chief  
Assistant**

CLEVELAND, Dec. 19—The engineering staff of the Peerless Motor Car Co., which will operate under the direction of B. H. Anibal as chief engineer has been completed. The personnel follows:

F. M. Holden, assistant chief engineer, with supervision of research and experimental work, was formerly research engineer of the Cadillac Motor Car Co.

Herman Schwarze, electrical engineer, in charge of electrical design and equipment, acted in the same capacity for the Cadillac organization. Schwarze is given the credit for having made practicable the electric starting, lighting and ignition principle, as embodied in the 1912 Cadillac.

F. W. Slack, chassis engineer, has been with the Peerless engineering department for 12 years. He has had much to do with the development of the eight-cylinder Peerless engine, being in charge of the designing.

W. R. Milner, body engineer, recently resigned from a similar position with the Cadillac company. Previous to his Cadillac association, he had filled the post of body engineer and designer for the Marmon company.

L. C. Tenney, chief draftsman, has been identified with automobile engineering and construction work since the early days of the industry. His longest term of service was with the Cadillac company.

Richard Emig, foreman of the experimental department, in charge of car building and machine shops, had practical experience in tool-making, machine operation, final finishing, experimental driving and machine shop supervision with the Cadillac Motor Car Co.

## Engine Size Is Reduced in Detroit Steam Car

DETROIT, Dec. 16—Further details of the steam car to be made by the Detroit Steam Motor Corp. indicate that an attempt will be made to bring the car down to a popular size.

The engine will be the Uniflow type similar to that used in previous successful steam cars, except that it is smaller. It is 10 hp.,  $3\frac{1}{4} \times 4\frac{1}{4}$  double acting single expansion, operating directly on the rear axle with Stevenson link valve gears. The boiler is a fire-proof type adapted for 500 lb. working pressure with 628 flues. Automatic control is used for the steam pressure, water level and fire, and the car is designed to operate on gasoline, kerosene or distillate.

Claims are made for 2000 miles to the gallon of lubricating oil and 15 miles to the gallon of kerosene. From 600 to

800 miles is claimed for each filling of water.

By the reduction of the engine size to about 50 per cent of the type formerly used and the reduction of the wheelbase to 110 in., it is expected that the weight will be kept below 2000 lb. The car will be mounted on  $31 \times 4$  in. tires and will be in the \$1,000 class.

An automatic pilot ignites the main burner when the volume of steam in the boiler drops below 450 lb. pressure. When the pressure reaches 550 lb. the main burner is automatically shut off. There will be four body styles provided, a roadster, five-passenger touring, coupé and sedan. Later there will be a light delivery wagon on the same chassis.

## Service Truck Obtains Big Order from Poland

WABASH, IND., Dec. 19—The Service Motor Truck Co. of this city has completed negotiations with the Government of Poland for what is said to be one of the largest individual truck orders ever made in peace times, by which the Polish Government buys hundreds of Service trucks, with parts and tires. The first shipment of four trucks is now on the way to Poland, according to the announcement by the company.

It is said that the Polish government is issuing bonds to be underwritten by a Polish-American banker's syndicate headed by John F. Smulski of Chicago. Consequent to this huge order it is expected that the company's plant will soon be working at maximum production. James M. Marshall and Harry McGuire of this city are now applying for passports preparatory to leaving for Poland, Bavaria, Russia, Czecho-Slovakia and other European countries where they will demonstrate trucks.

## Sharon Pressed Steel Co. Reorganization Completed

SHARON, PA., Dec. 19—Reorganization and refinancing of the Sharon Pressed Steel Co. has been completed and a financial statement as of Nov. 21 shows a satisfactory condition. Since the management was taken over last February by Henry W. Torney and Arthur E. Swan, the plant has been operating continuously and has shown a steady increase in output.

It now is running at about 50 per cent of capacity. The refinancing has been in the hands of Josiah Kirby of the Cleveland Discount Co., who is a director and large stockholder in the Sharon company.

## FULLER COMPANY ON FULL TIME

MADISON, WIS., Dec. 19—After running at greatly reduced capacity for many months, the Fuller & Johnson Mfg. Co., farm gas engines and machinery, has placed its force on a full time basis. A number of large orders for delivery in the first quarter of 1922 is responsible. The force at present numbers about 200 and is to be increased gradually.

## Organized Effort Aids Chicago Trade

**Christmas Helps Sales—Truck  
Manufacturers See Increase  
After January 1**

CHICAGO, Dec. 19—Daily rains for the past 30 days in Chicago territory have rendered Illinois roads almost impassable. This fact more than any other has had a retarding effect on the sale of automobiles in the Chicago market outside the city itself.

Sales in Chicago during the first two weeks of December are spotty in the extreme and seem to have responded in proportion to the effort put forth by the dealers. Organizations that have tuned up to meet present conditions of more difficult sales report satisfactory business.

Many of the city sales have been purely Christmas or gift sales. These have added materially to the volume and it is said by dealers, judging from prospects now in sight, that sales will keep up at a fair rate until a few days before Christmas.

## November Business Exceeded

With most dealers in Chicago sales show up better than for any two weeks in November and in many cases December to date has produced more sales than the whole of last month. No one class of cars is particularly in the lead in the Chicago market.

One of the bright spots in the local situation is the remarkable activity in motor trucks. Light capacity vehicles are in demand and these sales have been not unusual for some time. Heavy capacity trucks have been slow to move and this is true practically of the whole line. About the first of December demand began for these trucks and December so far has registered more sales than any one whole month during the last eighteen.

Manufacturing of trucks in Chicago is on a very low schedule with hopes for an increase after the turn of the year. Some of the makers expect to enter a capacity schedule after Jan. 1.

## Business Men to Continue Nashville Body Factory

NASHVILLE, Dec. 19—The plant of the bankrupt National Body Mfg. Co. has been purchased by a group of Nashville business men who will continue the manufacture of touring bodies for Ford cars. The plant already is in operation and the new management is optimistic over the prospects for spring business.

The company expects to be nationally represented by county dealers through State distributors. The old name will be retained. The purchasers are all active in other lines of business and operations will be carried on under the direction of J. S. Albert as general manager.

## Expect Price Cuts at New York Show

Reductions, Due to New Models,  
Certain, Particularly in Six-  
Cylinder Field

NEW YORK, Dec. 20—While motor car manufacturers naturally are exceedingly reticent on the subject, it can be accepted as certain that there will be several "readjustments" of prices and values, especially values, after Jan. 1. Most of them probably will be announced simultaneously at the opening of the New York show.

Some reductions or "readjustments" are certain, especially in the six-cylinder field. They will be brought about largely by the introduction of new models. This will include old as well as new lines.

The new six-cylinder Rickenbacker will sell for less than \$1,500 and it will have good body work and excellent material throughout. There also will be the Jewett light six which will bear the same relation to the Paige Motor Car Co. that the Essex does to the Hudson. Another new model will be a Chandler which, it is understood, will be in the light six field.

### Lexington Has Light Six

The Lexington Motor Co. will display at New York for the first time a light six which, it is understood, will sell for about \$1,300. The new Durant six, which is the rebuilt Sheridan, will be in production in January. It will sell for \$1,650. Other new light cars in prospect include the Frontenac and the Hanson six. It is known that the Studebaker models at the show will incorporate many changes and refinements.

Most of the actual price cuts probably will come in the heavier and more expensive lines. It is not denied that General Motors will announce a sharp reduction on its eight-cylinder line. No models of the new General Motors air-cooled line will be displayed at the shows, and it is probable there will be greater delay than was expected in getting them into production.

This is only a fraction of the lines which will have important announcements to make after the turn of the year.

Price considerations have become of prime importance in the automotive industry and costs are being scanned as never before. There will be fierce competition in all its branches in the next year. Those companies which are just coming into the field, although they have yet to establish a reputation, have one advantage in the fact that they can equip their factories at pre-war costs and can buy inventories at low price levels.

### Ford Denies Report

DETROIT, Dec. 20—The sales office of the Ford Motor Co. denies reports of an impending price cut and asserts that dealers who have inquired about it have

## TRUCK COMPETITION BEGUN BY RAILROAD

DETROIT, Dec. 20—The Michigan Central Railroad has inaugurated a system of fast daily local freight trains, running on express schedules, from Lansing to many points in Michigan, to compete with various automobile truck lines centering there. It is predicted that if these experiments successfully cope with truck competition, the service will be extended.

been informed that the reports are not true. No formal public denial has been made by the company, however.

There has been a feeling within the industry that Ford might be in a position to reduce his costs inasmuch as his plans for the production of glass and cotton will take form in the near future. It is believed that by the beginning of 1922, Ford will control all the materials used in his cars except tires, and that for this reason his production costs will be lower than ever before.

It has been persistently reported that Ford proposes to extend the plan under which he helps dealers to facilitate time sales. This probably will be particularly true in relation to dealers in small communities.

## Morrow Leaves Willys Subsidiary as President

NEW YORK, Dec. 20—The resignation of A. P. Morrow as president of the Willys-Morrow Co. is announced by John N. Willys. Morrow retires from the management of the Elmira plant after long deliberation because certain outside interests will require much of his time. He is not severing his relations with the company, however, as he will remain in an advisory capacity. Regret at his resignation is expressed by Willys and his associates.

Morrow had been at the head of the company since its organization more than 15 years ago. His work during the war was notable. Within a comparatively short time a plant was built and airplane motors were turned out in large quantities.

Walter P. Chrysler has been elected president of the company but he will serve in that capacity only temporarily. A permanent successor to Morrow has not been selected but it is understood one of the men proposed for the position is C. E. Killinger, treasurer of the Wilson Foundry & Machine Co., which is a Willys subsidiary.

### SMALL PROPERTY TO BE SOLD

INDIANAPOLIS, Dec. 20—All the property of the William Small Co., manufacturer of the Monroe car, will be offered for sale on Dec. 28 by Receiver Fesler.

## Low Inventories Create New Market

Parts Makers Will Benefit Even  
if Car Output is Un-  
changed

NEW YORK, Dec. 21—While a majority of parts manufacturers do not expect production of motor vehicles in 1922 to run far ahead of the 1921 output, they are confident their business will be considerably better, even with the same production schedules in force, for the reason that most vehicle manufacturers have worked down their inventories to the point where they are having to go into the market for supplies. Purchases from now on will be practically current with production so far as most unit parts are concerned. This working down of inventories is one of the most satisfactory factors in the situation so far as the parts makers are concerned.

### Truck Prospects Best

Those who supply truck manufacturers are even more optimistic than those whose chief business is with passenger car makers, for they are convinced the market for trucks will steadily expand as the year progresses and general business gets back on a more normal basis. One significant and gratifying report from the parts makers is that tractor manufacturers are slowly coming back into the field for supplies.

While production of motor vehicles has dropped off considerably this month, many parts manufacturers report that their December business will be better than for November. This is construed to mean that vehicle makers are preparing for January production. December has brought a large number of releases and a considerable volume of new business.

Although collections may be regarded as fairly satisfactory they are not quite as good as for the past two or three months.

A considerable number of jobbers have placed orders this month for January and February shipments.

## Body Company Formed to Specialize on Fords

DETROIT, Dec. 19—The Automotive Body Corp. has been organized by former officials of well known body companies for the manufacture of custom bodies and special four-door sedan bodies for Ford cars which are interchangeable with other Ford bodies.

The company will also do body engineering and build cabs and bodies for commercial cars. Repairing, painting and trimming will be handled in a special department. Davis Baker, formerly with the C. R. Wilson Body Co., is president; Paul Block, formerly of the Racine Mfg. Co., vice-president, and C. M. Mulholland, secretary and treasurer.

## Kentucky Wagon May Join Merger

**Stockholders Will Be Presented  
with Two Plans for Re-  
organization**

LOUISVILLE, KY., Dec. 20—Stockholders of the Kentucky Wagon Mfg. Co. at their annual meeting Jan. 12, will be called upon to consider complete reorganization plans, contemplating either a merger with several other concerns manufacturing automobile parts or placing a mortgage for \$750,000 on the plant and releasing it and its entire equipment to the Kentucky Mfg. Co. to be capitalized at \$1,000,000.

In notices to all stockholders urging them to be present at the meeting or to be represented there, it is stated that the reorganization is due to market conditions in cotton-producing sections of the South, which comprise the chief market of the company.

Both plans of reorganization are outlined in detail in the call for the meeting. The first proposes that a mortgage of \$750,000 be placed on the property not included in the personal property inventory and the organization of a new company to be known as the Kentucky Mfg. Co., to which the plant of the Kentucky Wagon Mfg. Co. will be leased for from five to ten years at \$200,000 per year. This amount, it is said, will pay the fixed charges of operation and provide a sinking fund to pay off the mortgage.

The lessor will apply the proceeds of the mortgage to the payment of debts and assume and pay off the balance of indebtedness itself. The lessor, the Kentucky Mfg. Co., will be capitalized at \$1,000,000 with the privilege to the stockholders of the wagon company to subscribe to the stock on the basis of one share of the new company for three shares of the wagon company.

The second proposal is for a merger with other companies in the Associated Motor Industries.

Should the consolidation of companies be effected the official call states that stockholders of the wagon company would receive stock in the Associated Motor Industries to the extent of 140 per cent of the net tangible assets of the wagon company. All the property of the wagon company would be sold to the merger organization which would assume all its indebtedness.

## Surplus War Material to Be Sold at 11 Camps

WASHINGTON, Dec. 20—Schedules for auction sales of the War Department Surplus Property Division show that motor vehicles and other supplies will be sold at 11 camps during January. Material which cost approximately \$12,000,000 will be placed on sale. A quantity of air service material will be disposed of at the sale at Omaha, Jan. 11.

The schedule calls for auctions at Bal-

timore, Jan. 5; Camp Grant, Ill., Jan. 7; Schenectady, N. Y., Jan. 9; Boston, Jan. 12; Camp Dodge, Iowa, Jan. 13; Fort Mason, Cal., Jan. 17; New Cumberland, Pa., Jan. 17; St. Louis, Jan. 19; Pittsburgh, Jan. 24, and Camp Lee, Va., Jan. 31. This automotive equipment is unserviceable and rejected by Federal departments.

## "Gier-Lewis" Developed by Motor Wheel Corp.

DETROIT, Dec. 21—Announcement of a new steel wheel, brought out by the Gier-Tuarc Division of the Motor Wheel Corp. of Lansing, was made coincident with the first annual sales meeting of the division and resulted in orders totaling approximately \$100,000 for delivery before April 1. It will be known as the Gier-Lewis.

The new wheel is a radial corrugated disc steel wheel for use on lighter types of cars, the corrugated metal resembling in appearance spokes of a wood wheel. The Gier-Tuarc wheel is for use on heavier vehicles.

C. C. Carlton, secretary of the company, said that the most remarkable feature of the convention was the confidence that the dealers expressed in the immediate future of the business. This confidence is exemplified in the orders placed by Reo Motor Car Co. for the first lot of Reo taxicabs.

## Temporary Receiver to Act During Oil Refining Suits

COLUMBUS, IND., Dec. 19—Judge John W. Donaker has opened the hearing on two suits for receivership brought against the Indiana Refining Co. by 107 stockholders of the company who charge mismanagement, misapplication and unlawful use of funds.

Before the hearing was begun a supplementary complaint was filed asking for a receivership to serve during the hearing of the suits. The petition was granted and the Peoples Savings & Trust Co. of Columbus was appointed to act as temporary receiver.

## COTTA SOLD FOR \$175,000

CHICAGO, Dec. 20—Closing the receivership in the Cotta Transmission Co., Rockford, Ill., T. E. Swords, representing the Rockford Trust & Savings Bank and other Rockford interests, bid in the property at the receiver's sale for \$175,000. The assets of the company were given at \$325,000 while the liabilities were approximately \$1,000,000. The company will be reorganized and the business continued.

## TO PASS ON OWEN CLAIMS

WILMINGTON, DEL., Dec. 19—Former Chancellor Charles M. Curtis of Wilmington has been appointed by Judge Morris in the United States District Court special master in the matter of Uri T. Hungerford vs. the Owen Magnetic Motor Car Co., in bankruptcy. Claims aggregate \$750,000.

## Custodian Succeeds Receiver for Gary

**President of Bank May Be Ap-  
pointed Trustee of Truck  
Company**

CHICAGO, Dec. 21—Judge Carpenter, sitting in the Federal Court at Indianapolis, appointed Charles Suprise, clerk of the Federal Court at Hammond, Ind., custodian of the property of the Gary Motor Truck Co., succeeding G. M. Semmes, who was appointed receiver by the Superior Court of Gary. Richard R. Schaff, president of the First National Bank of Gary, it is understood, will be appointed trustee within a few days.

At a recent meeting of the creditors of the company, a creditors' committee was appointed to look after the interests of the creditors and to work out a plan whereby the company's property may be kept out of forced sale. Seventy per cent of the creditors, representing 90 per cent of the indebtedness of the company, have agreed to accept the judgment of this committee which is composed of C. W. Dickinson, Timken-Detroit Axle Co.; Sloan of the Buda Co.; K. F. Conrad of Parrish & Bingham, and C. W. Fuller of Fuller & Sons Mfg. Co.

Frank Dawson, president of the Gary Motor Truck Co., asserts that he has enough money to refinance the company, thus keeping it out of a receiver's sale. His plan will mean that all the old stockholders will lose all their stock, but that the creditors will be paid in full. In case of a sale it is said that the creditors will not realize more than 30 per cent.

If the reorganization as planned by Dawson goes through, the new company will operate its own branches throughout the country and will build a business wagon in the speed class.

## General Motors Produced 139,400 Cars in 9 Months

NEW YORK, Dec. 21—Production by the passenger car divisions of the General Motors Corp. for the nine months ended Sept. 30 was 139,400 as compared with 290,250 for the same period in 1920. The production details follow:

	(Third Quarter)		(9 mos. to Sept. 30)	
	1921	1920	1921	1920
Buick .....	31,000	25,700	60,000	87,500
Cadillac .....	2,000	6,200	6,800	14,900
Chevrolet .....	20,000	37,100	45,000	119,800
Oakland .....	2,800	12,300	9,100	34,700
Oldsmobile ...	4,500	8,450	15,900	24,750
Scrpps-Booth.	1,200	2,700	2,600	8,600
Totals .....	61,500	92,450	139,400	290,250

## Packard Car Output, 6469

DETROIT, Dec. 21—Production of passenger cars by the Packard Motor Car Co. for the year ended Aug. 31 was 6469 and the output of trucks was 1386. In the year ended Aug. 31, 1920, the company manufactured 7667 cars and 7445 trucks.

## Kansas Expects Much from New Rail Rates

### Lower Cost of Shipping Crops Will Stimulate Buying Among Farmers

TOPEKA, Dec. 19—Reduction of 16 per cent in freight rates on grain and hay recently ordered by the Interstate Commerce Commission is expected by Kansas automotive dealers to have an excellent effect on business during the winter and to stimulate buying next spring.

Freight rates have been one of the sore spots with farmers, who have held that they were unreasonable and confiscatory in many instances, and this material reduction, in addition to giving them more money for their products by lessening the cost of getting them to market, will also have a favorable psychological reaction, dealers believe, and will bring farmers into the market who otherwise would have stayed out.

It is felt by many observers that many farmers have not bought more liberally, not so much because they lacked the money as because they felt they had been made the victims of the readjustment period and resented it to the extent of withholding their patronage as long as possible as a means of showing their displeasure.

## Durant Motors of New York Supplies California Branch

NEW YORK, Dec. 20—The Durant Motor Car Co. of New York has contracted to supply the Durant Motor Car Co. of California with 15 trainloads of Durant fours. Each train will carry not less than 150 cars and they will be dispatched every 10 days. The second trainload started for the coast to-day. In registration of new cars in the Metropolitan district for November, the Durant ranked fifth.

## Hoover Made Chairman in South American Work

WASHINGTON, Dec. 20—Considerable significance is attached to the appointment of Secretary Hoover as chairman of the United States section of the Inter-American High Commission, especially in relation to development of automotive markets in South American countries. Selection of this commission is taken to mean that the Government will make strenuous efforts to offset growing European influence in these neighboring republics.

This movement is of particular importance to the automotive industry at this time because of the intensive efforts of American motor manufacturers to cultivate these markets in spite of strong competition. The acceptance of the vice-chairmanship by Wesley L. Jones, chairman of Senate Committee on Commerce,

indicates that the legislative branches of the Government will support the program of the administration.

In an official statement, Secretary Hoover pointed out that the commission has under consideration in its various national sections a uniform commercial law among American republics, laws governing industrial and literary property, simplification of fiscal administrative relations in the matter of customs, etc.

## Harley Co. Plant Sold to Railroad Interests

SPRINGFIELD, MASS., Dec. 22—Negotiations have been practically completed by Pennsylvania railroad interests to purchase the plant of the Harley Co. in this city. It will be used to manufacture railway accessories and parts, including journals, couplings, fittings, etc. It cannot be learned here that it involves any plan to motorize the lines of the company. The sale probably will be completed Dec. 28.

The purchase of the Harley plant is believed to be the outgrowth of a recent announcement by the railroad that it will give up its own repair shops. It is proposed to begin operation of the plant within 30 days after the sale and enlarge the working force gradually to about 2000. The plant, which now covers four acres, will be gradually expanded next summer.

The Hendee Mfg. Co., which makes the Indian motorcycle, owns \$400,000 of the \$600,000 common and all of the \$600,000 preferred stock of the Harley Co.

## INVESTORS MAKE CHARGES

MILWAUKEE, Dec. 19—Two warrants have been issued by the district attorney of Milwaukee County charging larceny as bailee and embezzlement against Orson A. Towle, vice-president of the Holmes Air-Cooled Motor Car Co. of Canton, Ohio, who for a time maintained an office in Milwaukee for the sale of capital shares. Between fifty and twenty complaints have been made by local investors, who say they purchased and paid for shares in July and August, 1920, but have not received stock certificates.

## PARRETT DIVIDES WORK

CHICAGO HEIGHTS, ILL., Dec. 20—Recent reorganization changes have been completed in connection with the manufacture and sale of Parrett agricultural tractors which provide for two separate organizations, one covering manufacturing and the other sales, with Dent Parrett, president and general manager of each. The manufacturing organization is the Hicks-Parrett Tractor Co., the sales organization is the Parrett Tractor Co., both located here.

## FORD FOREIGN PLANS GROW

LONDON, Dec. 14 (*By Mail*)—It is reported here that the Ford Motor Co. soon will open an assembly plant at Antwerp, Belgium.

## Buda Incorporates Automotive Parts

### Subsidiary Has Established 29 Service Stations to Handle Company's Products

CHICAGO, Dec. 21—The officers of the Buda Co. have incorporated as a subsidiary the Automotive Parts Corp. of America, which has already established 29 service stations to handle Buda products, and the number of main stations ultimately will be increased to about 50.

The main stations will be supplemented by a series of sub-stations which will carry only the fast moving parts and will depend upon the main stations for the larger and more expensive parts.

By means of these stations the Buda company expects eventually to cover the whole country so that any part for a Buda engine can be obtained within a few hours. All stations will maintain a uniform list price.

Most of the Buda service stations now are carrying Torbenson axles and Fuller transmissions. These parts are handled under the same sales policy as that outlined by the Buda company.

Negotiations now are under way for servicing several other major units through this service station system.

It is proposed to adjust repair part prices from time to time so that they will be sold to the consuming public at only a fair margin of manufacturing profit.

## Dallas Trade Increases 20 Per Cent in December

DALLAS, Dec. 20—Retail sales of automobiles for the first two weeks of December show an increase of 20 per cent over a corresponding period in November. Dealers do not attribute the increase to holiday buying but more to lower prices.

There was also an increase of 15 per cent in the accessory and tire business. Truck dealers report a gain of from 5 to 15 per cent. Tractor business increased 10 per cent and trailer dealers report a corresponding gain.

## NEW ENGINE TO BE MADE

DETROIT, Dec. 21—The Superior Combustion Engine Corp. has been formed here to manufacture a two-cylinder, two-cycle engine which will burn either gasoline or kerosene. It is designed for use in either motor cars or boats. Production will be started, in a leased plant, on 500 15-hp. marine engines.

## GOVE PROPERTY SOLD

DETROIT, Dec. 21—The land and factory of the Gove Motor Car Co. was sold at trustees' sale to William Benham of Brighton, Mich., for \$2,500.

## Price Plan Violates Sherman Trust Law

### Supreme Court Hands Down Decision Affecting Conduct of Associations

WASHINGTON, Dec. 19.—Interpreted as uprooting the fundamental principles of trade associations which exchange price information, a majority opinion of the United States Supreme Court was delivered to-day by Justice Clarke on the so-called open price competition plan of the American Hardwood Manufacturers' Association.

By a divided opinion of six to three, the highest tribunal affirmed the decision of the lower courts, holding that competitors who exchange information as to past transactions, touching prices or production, are doing what is prohibited by the Sherman anti-trust law. So sweeping is the decision, in the estimation of attorneys who have closely followed the case, that it will force the dissolution of trade associations in some branches of industry and may develop a widespread change in methods of doing business.

#### Controls Prices

The case for the first time presented the legal question as to the practices of those organizations in industry which are known as "open price associations." The court upheld the contention of the Government that such a plan was invented and adopted by the industrial world to circumvent the provisions of the Sherman anti-trust act as to co-operation and exchange of information in trade. The Government insisted that the operation of the plan is far more efficacious in controlling prices than an actual agreement fixing prices between the same persons.

Justice Clarke held that the plan "constituted a joint conspiracy to restrict lumber production in the country and keep prices up." He declared that the arrangement was nothing more than calling an old scheme by a new name. According to the opinion expressed for the court there was no evidence presented showing the existence of a "gentlemen's agreement," but the result was "a harmonious individual action among large groups of natural competitors."

#### Restricts Production

Justice Clarke said that while the plan on paper, to all appearances, provided for data on past performances, or transactions which it was claimed could not be used in fixing prices, the detailed discussion and predictions in the trade, coupled with the expert analysis by statistical experts, indicated to the court that the plan was a combination which primarily had a tendency to restrict production and, consequently, it was a con-

## FIFTH AVENUE TO GET FIVE CENT BUS LINE

NEW YORK, Dec. 19.—Mayor Hylan has announced that the administration has completed its plans to establish a new bus line on Fifth Avenue and Riverside Drive, which will charge a five cent fare and operate in opposition to the Fifth Avenue Coach Co., which charges a ten cent fare.

certed effort to increase prices.

It was the contention of Justice Clarke that detailed argument of the purposes of the plan was not necessary because the effect of the combination could be easily ascertained in the market columns of daily newspapers and Government publications. Considerable stress was placed upon the employment of an expert statistician by the hardwood organization as an assistant to the secretary, which the court described as "an authoritative voice of the organization."

#### Circumstances Affect Application

It is a source of speculation as to whether the Government will proceed against other trade associations in other industries unless they either voluntarily dissolve or restrict their activities. This point arises from the statement of the attorney general in the supplemental brief filed in hardwood case in October, in which it was said:

Manifestly, the results of the co-operation of this open price scheme are different when applied to different industries, and under different economic conditions. This court will become fully informed as to its various effects unless the disposition of this case be such as to render future actions of this character useless.

By considering the motives which control human conduct, we can reach a reasonably correct conclusion as to what some of the results have been, and will be, if the activities of these associations are not restrained, under the varying conditions in-

(Continued on page 1250)

## Suggestions Embodied in New Dealer Contracts

NEW YORK, Dec. 20.—Several automobile manufacturing companies already have notified the National Automobile Chamber of Commerce that they are incorporating in their dealer contracts several of the suggestions made as a result of conferences between special committees representing the N. A. C. C. and the National Automobile Dealers' Association.

Some companies have gone even further in modification of their contracts than suggested by the N. A. C. C. directors. The manufacturers feel that if the N. A. C. C. suggestions are adopted dealers will have a perpetual contract rather than one limited to a certain period. It is pointed out, however, that the N. A. C. C. has no authority to direct the general adoption of its suggestions and that this is a subject which must be understood by each individual dealer.

## Austrian-Daimler Appears in Orient

### Makes Bid for Japanese Trade— Shows Influence of Air- plane Design

NEW YORK, Dec. 21.—Austrian automobiles are again appearing in the Oriental markets, according to information received here. One of the first cars of Austrian manufacture to reappear is the Austrian-Daimler which is making a strong bid for business on the Japanese market.

It is reported that the Austrian-Daimler clearly shows the effect of the airplane design. The engine is aluminum, with steel cylinder block, water jacket and upper half of the crankcase being one casting, with cylinders of 85 mm. bore and 130 mm. stroke. The detachable head carries the valves, which are angled slightly, and supports the overhead camshaft, which is driven by a short vertical shaft and bevel gears from the crankshaft.

#### Lubrication Force Feed

Lubrication is force-feed throughout, with a gear-driven pump and dash oil pressure indicator. The cooling system depends on a centrifugal gear-driven pump, with a very large V-shaped honeycomb radiator. The flywheel is vanned to assist the air flow. The carburetor is mounted on the right side, directly on the water-jacket, and the inlet manifold is within the water jacket. The magneto is a variable-spark Bosch, and the whole engine is declared to be of exceptionally clean design.

The transmission, which provides four forward speeds and a reverse, is carried in an aluminum housing, and the gear and hand brake levers are mounted in a central position. The transmission is provided with a tire pump and speedometer drive. A large transmission brake of the contracting type is mounted on the drive shaft directly behind the transmission. The propeller shaft has but one universal, and is completely inclosed in a large torque tube, which is oil-tight.

#### Radiator on Crankcase

The chassis presents several unusual features. For instance, the radiator, instead of being mounted on the frame, is mounted on an extension of the crankcase, thus permitting a more or less floating construction. The gasoline tank, mounted at the rear on an extension of the frame, holds 30 gallons and in addition to the vacuum feed, has an engine-driven pressure pump.

The wheelbase is 135 inches, but due to the use of a V-shaped radiator, an unusual amount of body space is provided, and the chassis will take bodies suitable for cars up to 140 inches wheelbase. Due to the wide use of aluminum, the car is not heavy, weighing only about 2500 pounds.

## Lincoln Appraisal Report Completed

**Assets Total \$9,490,811.13; Liabilities, Exclusive of Capital Stock, \$9,073,105.46**

DETROIT, Dec. 19—The appraisal of Lincoln Motor Car Co. property as filed in the United States District Court today shows a reduction in the assets of about \$5,500,000, the total assets as carried on the company's books being reduced from \$15,061,492.89 to \$9,490,811.13. Liabilities, exclusive of the \$7,313,600 capital stock outstanding, total \$9,073,105.46. With the capital stock included in the liabilities there is a deficit of about \$7,000,000.

Cash on hand is \$35,273.18. Other current assets carried on the company's books at \$898,445.60 are reduced to \$698,207.33 in the court appraisal. The inventory is cut from \$3,863,484.49 to \$1,998,929.87. Such items as prepaid taxes, manufacturing expense deferred, commercial work deferred and development work deferred, totaling over \$2,400,000 on the company's books are wiped out in the appraisal.

### Tax Claim Not Included

Items in the fixed assets such as buildings, machinery, plant equipment, long lived tools, diamonds, office fixtures and motor vehicles show heavy deflation in the appraisal report, the difference between the company's and the appraisal figure being about \$4,300,000. Land holdings show an appreciation, the totals being \$1,562,743.62 and \$1,709,401.

Principal items in the liabilities are: Accounts payable \$1,276,470.59, notes payable \$4,930,476.79, drafts discounted \$428,261.68, notes receivable discounted \$144,938.61, land contracts payable \$237,280, bonds payable (first mortgage) \$1,882,000. The Government claim of \$4,500,000 for additional taxes is not considered in the financial statement.

### To Borrow \$35,000

A statement to creditors and stockholders made simultaneously with the financial report, declares application has been made to the court by the receiver for authority to borrow not to exceed \$35,000 for payment of preferred labor claims and for authority to issue and sell receiver certificates not exceeding \$500,000 in amount for use as found necessary. The United States Commissioner of Internal Revenue has agreed that these shall be prior in lien to the Government's claim.

Notice that the hearing on the additional tax sought by the Government is now in progress, is also contained in the statement. Harold H. Emmons, counsel for the Lincoln Motor Co., is conducting the contest of the claim. The decision by the Commissioner of Internal Revenue will be reported by the receiver to the creditors and stockholders.

Show preparations are being carried through by the receiver. Four vehicles

## STATEMENT SHOWS WIDE DIVERGENCE IN ESTIMATES ON LINCOLN ASSETS

DETROIT, Dec. 19—A statement of assets and liabilities of the Lincoln Motor Co., as of Nov. 8, 1921, showing the comparison between the company's estimates and the receiver's appraisal, has been mailed to the creditors and stockholders by the Detroit Trust Co., receiver. It is as follows:

ASSETS	COMPANY'S BOOKS	COURT APPRAISAL
Cash .....	\$35,273.18	\$35,273.18
Notes receivable .....	\$237,470.58	173,795.08
Accounts receivable .....	183,551.21	54,366.09
Outstanding drafts .....	536,448.15	433,084.15
Sundry debtors .....	2,582.96	1,716.83
	<u>\$960,062.90</u>	
Less reserves .....	61,607.30

(\$632,000 pledged as collateral to note payable)		
Total liabilities .....	\$9,073,105.46	

NOTE:—Liability for uncompleted purchase contracts estimated at \$1,500,000.00.

Books show Class A stock \$3,000,000.00 with \$7,313,600.00 outstanding.

Above statement does not contain any liability on account of U. S. Government claim of \$4,500,000.00 for additional income and profits taxes.

will be shown in New York and six in Chicago. R. C. Getsinger, sales manager for the Lincoln company, will be in charge of the exhibits.

## Franklin Puts Force at Plant on Full Time

SYRACUSE, Dec. 19—Full time for its regular force of 3000 employees will be put into effect on Jan. 3 by the Franklin Automobile Co. Factory officials state that by Feb. 1 an output of 44 cars daily will be reached.

During January the actual output of cars will be somewhat under this mark, owing to time required to get all the fabricated parts to the assemblies. For a number of weeks recently, mostly on account of seasonal influences, production has varied with shipping requirements, the working week fluctuating from three days to five days.

## Upson Proposes Prizes for Airship Designing

NEW YORK, Dec. 19—Addressing the New York Chapter of the Society of Automotive Engineers on "aeronautical lessons from Europe," Ralph Upson, airship designer and international balloonist, proposed that the United States Government set aside each year \$500,000 which would be divided into a series of prizes for the best new designs to bring about safety for passengers, economy for merchandise and mail and night flying.

## LITTLE HARDWOOD BUYING

MEMPHIS, TENN., Dec. 19—In the hardwood market here it is stated that automobile manufacturers apparently have ample stocks on hand to carry them over the inventory period as none are buying, except from hand to mouth or day by day.

## FINANCIAL NOTES

Ajax Rubber Co. bonds in the amount of \$3,000,000 are being offered through W. A. Harriman & Co. The bonds are first mortgage sinking fund gold 8s and are priced at 99½ and accrued interest, to yield more than 8 per cent. They are callable as a whole but not in part except for sinking fund purposes at 110 and accrued interest. The proceeds of the financing will be used to pay off all bank loans. Report of the company for the nine months ended Sept. 30 shows a loss after interest charges of \$3,966,455 including inventory write-offs, operating losses and reserves. Net sales were \$8,037,382 again \$17,031,121 for the full year of 1920. The balance sheet as of Sept. 30 after giving effect to new financing shows cash, \$740,387; receivables, \$4,783,274 and inventories of \$2,594,036. The liabilities include: mortgage bonds, \$3,000,000; accounts payable, \$642,424; taxes, \$84,991 and reserves against commitments, \$181,000. Net quick assets were estimated at \$11,300,000 after new financing.

Wood Rubber Co.'s offering of 7 per cent fifteen-year notes aggregating \$6,000,000 has been oversubscribed and the books have been closed, according to Brown Brothers & Co. and Hayden, Stone & Co., through whom the offering was made. In connection with the new bond issue the company will retire by redemption or purchase at least \$200,000 par value amount of notes on or before Dec. 1, 1926, and at least \$200,000 additional par amount before every succeeding Dec. 1 to 1935 inclusive. The company's net quick assets are estimated at \$11,300,000 after giving effect to the proceeds of the notes and of an issue of 10,000 shares of its common stock.

Advance-Rumely Co. for the current year will probably show an operating deficit of close to \$750,000, which does not include losses to be charged off on account of inventory depreciation. Regardless of this the company will emerge in better shape than many of its competitors. Inventory at the end of this year will approximate \$8,000,000, against \$10,490,000 at the close of 1920. The company has reduced notes payable from \$4,000,000 earlier in the year to \$1,000,000 and has approximately that amount of cash in banks. Working capital at the close of 1920 was \$13,787,000, including \$10,490,000 of inventories.

Stromberg Carburetor Co. of America, Inc., for the first nine months of 1921 reports surplus earnings of \$126,091 after charges and Federal taxes, which is equivalent to \$1.68 a share earned on 75,000 shares of capital stock of no par value outstanding. Total earnings for the period, including other income, amounted to \$433,273, while expenses amounted to \$284,682 and Federal taxes \$22,500. The general balance sheet as of Sept. 30, 1921, shows a surplus of \$2,478,761 as compared with \$2,527,275 at the same time last year. Inventories are valued at \$654,668 as compared with \$967,090 in 1920.

American Bosch Magneto Co. management reports that it has more business in prospect to supplement the \$3,000,000 forward orders on its books than ever before. Gray & Davis, which manufactures for Bosch its starting and lighting systems, is already feeling the results of the latter's selling efforts. It has been gradually increasing its output and if releases continue to come in as they have of late it is expected that the output by March will be up 9000 or 10,000 systems a month, or practically capacity.

Republic Motor Truck Co., Inc., balance sheet as of Sept. 30, 1921, shows assets, including investments in and advances to

affiliated companies, of \$1,946,496; cash, \$488,097; notes and accounts receivable, \$819,642; government securities, \$10,411; inventories, \$4,318,442; deferred charges, \$135,335. The liabilities include a funded debt of \$2,591,162; notes and accounts payable, \$1,741,519; accrued accounts, \$199,540; reserves, \$355,000, and surplus, \$583,132.

Martin-Parry Corp. earned more than \$100,000 after all charges and federal taxes in the nine months ended Sept. 30, which is equivalent to slightly more than \$1 a share on the 100,000 shares of no par capital stock outstanding. This was accomplished in the face of deficits for the first quarter. Indications are that earnings in the current quarter will bring the total for the twelve months close to \$200,000, thereby showing the \$2 annual dividend fully earned.

Aero Cushion Inner Tire Co. has been authorized by the Utah securities commission to give with each bond of the company sold a 50 per cent par value stock bonus, the value of the stock being \$20 per share. The company has received permission to dispose of \$50,000 worth of its 8 per cent 5-year gold bonds. This company has a capital of \$250,000.

Grand Rapids Tire & Rubber Corp., Grand Rapids, has increased its capital stock to \$3,000,000, made necessary by the demand for larger factory space. The increased capitalization will permit the erection of buildings insuring a daily production of 2000 tires and 4000 tubes. The company has announced a 2 per cent dividend on preferred stock payable Jan. 1, 1922.

F. B. Stearns Co. earnings for 1921 will compare favorably with 1920, according to President G. W. Booker. He states that there are fewer than 200 cars in dealers' hands. The plant will close down during the holidays for the usual inventory.

Torbenson Axle Co. states that payment of the 1½ per cent quarterly dividend on preferred stock due Dec. 1 has been deferred.

Federal Motor Truck Co. has declared a dividend of 1½ per cent, payable Dec. 24 to stock of record Dec. 17.

Rolls-Royce of America  
Develops Organization

SPRINGFIELD, MASS., Dec. 19—In further development of its organization, Rolls-Royce of America, Inc., has made several additions to its staff. M. A. Pollock, formerly with the Locomobile Co., has been appointed assistant sales and advertising manager. P. D. LeVeness, associated at different times with the Pierce-Arrow, Locomobile and other companies, has joined the sales organization as territorial representative. A. C. Warren, of long experience as an automobile salesman in that city, has become identified with the New York branch.

Julius A. Olivier has been named to have charge of body designing and engineering. George W. Kerr, the veteran designer of coaches and carriages, has been added to the staff. Olivier was associated with the Locomobile company, and was previously identified with the coach-building organization of Brewster & Co. Kerr, originally a builder of horse-drawn carriages and coaches, has been connected with automobile manufacturing concerns for the last fifteen years.

Beginning with the first of January Rolls-Royce is to enter on a season of expansion in production and selling.

## BANK CREDITS

Written exclusively for AUTOMOTIVE INDUSTRIES by the Guaranty Trust Co., second largest bank in America.

During the past week the tendency in the call money market was toward firmness, quotations remaining at 4½ per cent to 6 per cent as in the previous week. The rate quoted for fixed-date maturities from 60 days to 6 months remained unchanged at 5 per cent to 5½ per cent, all industrial loans being negotiated at ¼ of 1 per cent lower. Prime commercial paper remained unchanged at 5 per cent to 5½ per cent.

The Federal Reserve statement as of Dec. 14, 1921, showed that the cash holdings of the Reserve System have passed the 3-billion mark for the first time in its history. During the past week the inter-bank borrowings were further reduced. The Atlanta institution settled its entire indebtedness by redeeming \$4,300,000, the total amount of bills held under discount with the Boston bank, while Dallas reduced its indebtedness from \$1,900,000 to \$1,000,000.

The total reserves of the New York institution decreased \$10,865,000, while total bills on hand increased \$7,070,000. Total earning assets increased \$23,121,000 and total deposits \$7,927,000.

On Dec. 9, the directors of the Federal Reserve Bank of Richmond announced a reduction in rates for all classes of paper from 5½ per cent to 5 per cent. This is the second reduction which the Richmond institution has made this year, the reduction from 6 per cent to 5½ per cent having occurred about three months ago.

One of the most noteworthy features in the week's investment markets was the flotation of an issue of \$55,000,000 50-year 4½ per cent corporate stock of the city of New York to refund part of its floating debt. This offering was made to the public on approximately a 4.25 per cent basis. This borrowing marks the first long-term borrowing which the city has made in more than four years and the price at which the issue was sold to the bankers, 103.407, was the highest the city has ever received for similar issues.

Further evidence of the demand of the investing public for prime securities, even of short-term maturities, was shown by the fact that subscriptions to the offering of \$250,000,000 of 4½ and 4½ per cent Treasury Certificates of 6 months and 1 year maturity aggregated more than \$1,000,000,000.

## SPLITEX MAKES ASSIGNMENT

RACINE, WIS., Dec. 19—The Splitex Radiator Mfg. Co., manufacturer of passenger car, truck and tractor radiators, has made an assignment in favor of creditors. Richard G. Harvey has taken charge as trustee and after completing inventory will offer the assets for sale. The concern was incorporated in 1918 with \$150,000 capital, and in 1919 built a new plant, which for six months has been operating at minimum production.

## INDUSTRIAL NOTES

**Cogswell Manufacturing Co.**, maker of automobile parts, is enlarging its plant at Springfield, Mass.

**Auto Metal Body Corp.**, Springfield, Mass., is operating its plant at full capacity to fill rush orders for bodies for Hupmobile cars.

**Hoover Body Co.**, York, Pa., has established a direct factory sales branch at the northeast corner of Webster Avenue and Boulevard, Long Island City.

**Robert H. Hassler, Inc.**, of Indianapolis, an Indiana corporation, has been granted a charter in Wisconsin. A branch has recently been opened in Milwaukee in charge of I. M. Cornelius as manager.

**Farmers' Sales Co.** has been organized in Lansing, Mich., by John H. Chapman to distribute Durant cars in Lansing and the four adjacent counties. The company will occupy the sales building which has been built at the plant.

**Chadwick DeLamater Corp.**, 623 West Twenty-third Street, New York City, has been appointed distributor by the Timken-Detroit Axle Co. of its axle parts. It will serve the metropolitan territory. The company is also distributor of Continental Motor parts.

**Diamond Hofast Rubber Co.**, tire manufacturer, will complete its new factory in Atlanta and be ready for operations by Jan. 1, 1922, officials of the company announce. The factory is being built on an 11-acre tract, the main unit occupying a site 80 by 200 feet. Production will be greatly increased.

**International Harvester Co.** Akron plant is rehiring several hundred of its former employees. Effective Jan. 1 the company will go on a production basis of five speed trucks and 40 tractors a day, officials report. Indications are that spring orders will necessitate a substantial increase in this schedule.

**Wilson Foundry & Machine Co.**, the Willys subsidiary at Pontiac, will reach a production of 150 Knight engines by Feb. 1, instead of 75 daily by March 1, as was originally scheduled. Machinery will all have been shipped from Elyria this week and production will start on the engines early in January.

**Pan American Motors Co.** directors, Decatur, Ill., have voted to dissolve the corporation. A meeting of the stockholders has been called for Jan. 17 to ratify this action. It is stated that the corporation is solvent but has been affected by the business depression and that money will be saved the stockholders by winding up the company's affairs now.

**Alfred J. Tank**, secretary and treasurer of the Wisconsin Gear & Axle Co., Wauwatosa, suburb of Milwaukee, is one of the incorporators of the Milwaukee Parts Corp. of Wauwatosa, organized to manufacture, buy and sell axle castings, tools, machinery and mechanical appliances of all descriptions. The other incorporators are John L. Michalski and Louis Schieble, Milwaukee.

**C. R. Wilson Body Co.**, Detroit, has purchased the painting and trimming plant of Henry E. Hund Co., which will place the company in a position to furnish automobile bodies complete. All construction work will continue to be centralized in the main plant, but the painting and trimming operations will be done at the newly acquired plant. Henry E. Hund will remain in charge under the Wilson management.

**Stewart Storage Battery Co.** has been incorporated at Marshfield, Wis., with \$125,000 capital stock to manufacture and deal in storage batteries, supplies, etc. The business was established about eight months ago by P. A. Stewart, a veteran battery manu-

facturer, in association with local capital. The factory has been in production about four months and is steadily increasing its working schedules to catch up with unfilled orders.

**States Oil Co.** of Louisville has been purchased by the Ohio Refining Co. of Cincinnati for \$250,000. The business of the local concern is to be carried on as formerly by the new owners. The tangible assets of the States Oil Co., which operates thirty-five filling stations in Louisville and a distributing station in Memphis, are estimated to be worth \$300,000. A. Mathis, president of the company, becomes a director of the Ohio Refining Co.

**Commonwealth Motor Co.**, Rockdale, Ill., is employing 100 men on night shifts due to increased orders. A contract signed with a Chicago taxicab company will extend over a period of five years. All necessary cars and accessories will be supplied by the Rockdale plant and it is planned to centralize the body, trim and paint shops there. Production during the last year has averaged two cars a day. This schedule it is planned to increase to three a day in 1922.

**Midwestern Tractor Wheel Co.** is establishing a plant at Amherstburg, Ont., and expects everything to be in readiness for operations by July 1, 1922. The plant will employ 450 men and will have a capacity of 150 sets of wheels. The company is capitalized for \$1,000,000. The officers are E. Edminston, president; T. H. Fox, first vice-president; Charles A. Cuddy, second vice-president; J. G. France, treasurer; A. E. Carpenter, secretary. H. H. Lane is an additional member of the board of directors. The production manager and chief mechanical engineer is Glen J. Walker, long associated with automobile factories in the United States.

## Robinson Is Chosen Head of U. S. Tractor Company

MENASHA, WIS., Dec. 20—J. M. Robinson, formerly president and general manager of the Rumley Products Co., has been elected president of the United States Tractor & Machinery Co. He has had long experience in all branches of the implement and tractor industry.

Robinson was first recognized in the commercial world when he was made sales manager for Ohio by the Milwaukee Harvester Co., of which he later became general manager. When this company was merged with the International Harvester Co., Robinson was made divisional manager. At the time C. S. Funk assumed charge of the Rumley company, he selected Robinson as president and general manager, in which capacity he served until he was appointed general sales manager of the Acme Harvesting Machine Co. His next position was general manager of the D. M. Sechler Implement & Carriage Co. of Moline. Robinson was with the International Harvester Co. in the days when the first gasoline farm tractors were developed.

## PREMIER HEARING POSTPONED

INDIANAPOLIS, Dec. 20—Judge Anderson has postponed the hearing on the application for a receiver for the Premier Motor Corp. V. A. Whipple reports that reorganization plans are progressing and hopes to have some definite statement on this subject within a short time.

## Foreign Inquiries Show Good Volume

### Conditions in December Further Dissipate Pessimism Among Export Managers

NEW YORK, Dec. 20—Foreign orders and inquiries are being received this month in good volume by numerous companies in the Detroit district, to judge from the statements made there last week during the visit to that city of Gordon Lee and William I. Irvine of the automotive division of the Bureau of Foreign and Domestic Commerce and George F. Bauer, foreign trade secretary of the National Automobile Chamber of Commerce. November export business was either equal to or somewhat higher than that enjoyed in October and the pessimism that was so widespread among export managers and executives has been largely dissipated, Bauer stated here to-day.

"The companies which have gone after foreign trade are receiving numerous orders and inquiries," Bauer declared. "Others, of course, are not so fortunate but it is plainly indicated that American manufacturers, through concerted efforts can develop a large demand for automotive products in foreign countries. The improved exchange situation and the generally better tone to all business are responsible for the present status of our export trade."

The trip to Detroit was made by Lee, Irvine and Bauer in order to acquaint the trade with the efforts of the new division of the Commerce Bureau. Conferences were held with a number of export managers and a well attended luncheon was held at one of the Detroit clubs. The export managers, according to Bauer, were keenly interested in plans for financing their foreign trade and this will be made a special subject at the meeting to be held here during show week.

Lee visited several other cities in Michigan and Ohio during his westward trip and Irvine went also to St. Louis to effect contact with manufacturers there.

## Italian Automotive Plants Show Increased Activity

WASHINGTON, Dec. 19—Increased activity was noted during the past month in the automotive factories of Italy, according to a cablegram received by the Bureau of Foreign and Domestic Commerce from its commercial attaché at Rome.

The Ansaldo Co., one of Italy's largest industrial corporations, is reported to be in financial difficulties, arising from over-expansion previous to the recent collapse of business. The cable reports, however, that a banking syndicate, with a capital of 600,000,000 lire, has been formed to take over part of the Ansaldo stock.

The general economic situation in Italy is said to be undergoing a gradual improvement that takes in most manufacturing and industrial lines.

## MEN OF THE INDUSTRY

Arthur F. Linneman, Elgin, Ill., has been elected a director of the Duty Motor Truck Corp.

E. M. Eshnaur, formerly connected with the Baker Lockwood Mfg. Co., has been appointed Pacific Coast representative of the Pennsylvania Plaston Ring Co., Cleveland.

E. W. Goodwin, body designer, has joined the engineering department of the Maxwell-Chalmers companies. He was formerly a body engineer with Cadillac and later with Packard.

Roger W. Angstman has been appointed sales manager of the automotive division of the Liggett Spring & Axle Co. of Monongahela, Pa., with offices in the General Motors Building, Detroit.

Louis C. Block, president of the Philadelphia Automobile Trade Association and until a year ago branch manager of the Ford Motor Co. in that city, will handle the new Gray car in the Detroit territory.

Edwin Allan Lightner, who has been western Connecticut sales manager for the B. F. Goodrich Rubber Co. at New Haven, has been appointed eastern district manager of the Republic Rubber Co. with headquarters in New York.

Roy D. Hartz has been appointed general sales manager of the Leach Biltwell Motor Car Co. For a number of years Hartz was associated with the Premier Motor Co. and the Hupp Motor Car Co. He was sales manager for the Moreland Motor Truck Co. of Los Angeles for a considerable period and more recently was general manager of the Lynn C. Buxton Motor Co. of Los Angeles.

Homer V. Hawk has resigned as general purchasing agent of the Willys-Overland Co., with which organization he has been associated for the last twelve years. The work of his department will continue to be under the direction of M. P. Cromling, formerly of the Buick company, who joined Willys-Overland interests in 1920 and whose headquarters have been at the executive offices of John N. Willys in New York City.

Albert U. Wildman has been appointed manager of manufacturing of the Cadillac Motor Car Co. to succeed George H. Layng, who has resigned. From 1910 to 1914 Wildman was treasurer and general manager of the Auto Parts Mfg. Co. and in the latter became associated with the Cadillac company as a superintendent. During the war he was engaged in the production of Liberty motors for the government and in 1919 returned to Cadillac as assistant manager of manufacturing.

Edwin B. Tozier has been appointed district manager of the Republic Rubber Corp. for the Chicago territory. Tozier was connected for a number of years with the Diamond Rubber Co. as manager of the Cincinnati and Minneapolis branches. In 1912 he became affiliated with the United States Tire Co. and served as district manager at both the Minneapolis and Chicago branches. Following this connection he became general sales manager of the General Tire & Rubber Co.

Orville E. Truesdell, for the past five years manufacturer's representative of the Firestone Steel Products Co., has joined the Bimel Spoke & Auto Wheel Co. as secretary and sales manager. L. P. Sims, secretary and treasurer, has resigned to engage in business in Los Angeles. Ollie V. Garrison, until recently purchasing agent for the Service Motor Truck Co., has been appointed assistant to the president of Bimel Spoke, his duties also placing him in charge of purchases.

G. W. Mason has joined the Maxwell and Chalmers companies as assistant to Vice-President W. Ledyard Mitchell. Mason has been associated with Studebaker and Dodge Brothers and the Wilder Tanning Co. in production work and was assistant in production and purchasing to the general manager of the American Auto Trimming Co. He has also been manager of the business extension department of the Irving National Bank in New York.

Designer of Northway  
Truck and Car Resigns

BOSTON, Dec. 21—Ralph E. Northway has resigned as vice-president and director of the Northway Motors Corp. of Boston and Natick, Mass. He was the designer of the truck and car which bears his name.

The Northway Motors Corp. has listed the right to its exclusive use of the name Northway as its most valuable asset.

Northway himself has been associated with the automobile industry for many years.

Doughty Will Exhibit  
Air-Cooled Car at Show

DETROIT, Dec. 20—Plans for the manufacture in Detroit of a new car with an air-cooled engine by a corporation in which W. J. Doughty, for years the Franklin distributor in Detroit, is to be a prominent figure, are being hurried to completion so that the car may make its appearance early in 1922.

Its first showing will be at the Detroit show. The car will sell in the \$1,000 class and will weigh about 1500 lb. The wheelbase will be about 110 in. Doughty recently resigned the Franklin franchise to devote his entire attention to the development of the new car.

## EARL ANNOUNCES SCHEDULE

JACKSON, MICH., Dec. 21—The Earl Motors, Inc., during the holiday period, Dec. 23 to Jan. 3, will install needed machinery in its plant here. It is planned to build 1000 cars during January, and this number will be increased to 1200 in February and March. Increased production is expected during the summer as orders are coming in steadily.

## WRIGHT BEARING RECEIVERS

PHILADELPHIA, Dec. 20—Judge Dickinson in the United States District Court has appointed W. B. Stratton of New York and Harry W. Champion of this city receivers in equity of the Wright Roller Bearing Co. The company's assets are placed at \$884,000 and the liabilities at \$529,000.

## GRAY HAS 100-IN. WHEELBASE

DETROIT, Dec. 21—The Gray car, which will be produced by the Gray Motors Co., will have a 100-in. wheelbase, sliding gear transmission, ventilating windshield, self starter and demountable rims. The chassis will be of alloy steel.

## METAL MARKETS

ALTHOUGH the few days that remain of the old year are bound to be featured by the quiet which always characterizes automotive steel demand during the inventory period, a very fair quota of business is in process of negotiation and expected by the steel mills to result in actual sales contracts shortly after the holidays. Passenger car builders are displaying keen interest in quotations for sheets, especially full-finished 22-gage, not only for first but also for second quarter 1922 deliveries. It may be said without fear of contradiction that there is in evidence more willingness on the part of sales managers and purchasing agents to get together than has been the case in a long time.

Especially those steel producers who cater to the wants of the automotive industries are striving to facilitate the placing of orders for deferred deliveries by making their quotations as attractive as present-day costs permit. In the sheet industry, for instance, one notices as energetic opposition to a renewal of inflation among producers as among consumers. Stabilization of prices, permitting of a good backlog of orders, is apparently the aim rather than the artificial and always dangerous upward manipulation of price levels. In fact, the tendency in the steel market appears to be toward price reductions in those commodities in which demand has gained sufficient momentum to warrant hopes of its further expansion under the impetus of reductions.

An illustration of this was furnished by the recent \$5 per ton reduction in the price of steel pipe, for some time one of the most active items in the list of steel products. Somewhat of a similar tendency is noted in the pig iron market, where foundry iron amid somewhat more active demand has declined from the nominal quotation of \$20.50 to the actual one of \$19.50. If Ford has been correctly quoted in the newspapers to the effect that "so long as rails are more than \$40, we shall not buy a rail for the Detroit, Toledo & Ironton Railroad; we'll use the ones we've got until they are worn down to wires before we will pay more than \$27 or \$28," he is following out one policy with reference to his railroad's steel needs and quite another with reference to the Ford Motor Co.'s steel requirements. The latter has been placing orders for steel products right along at much higher prices than would correspond to the \$28 limit set for rails by Ford.

Pig Iron.—Automotive foundries in the Middle West are beginning to inquire for fair-sized tonnages of malleable. The market is easy but cheerful.

Steel.—Automotive inquiries for first quarter 1922 deliveries embrace full-finished sheets, cold-drawn steel bars, cold-drawn wire and alloy steels. Several makers of alloy steels have revised prices slightly upward. Demand for bolts and nuts is in abeyance.

Aluminum.—Several fair-sized inquiries for 1922 shipments are in the market, the tone of which is perceptibly improved. Virgin ingots 98 to 99 per cent pure, are quoted by importers at 17c. to 18c., duty paid, with sellers reluctant to book much forward business at the lower figure of this range. Sheet demand is modest but in the ascendancy.

Copper.—The market is permitted to enjoy a period of rest. Speculative commitments, however, are on the increase.

# Calendar

## SHOWS

- Jan. 7-13—New York, National Automobile Show, Grand Central Palace. Auspices of N.A.C.C.
- Jan. 9-14—New York, Motor Car Body Exposition, Automobile Body Builders Association. Twelfth Regiment Armory.
- Jan. 28-Feb. 4—Chicago, Automobile Salon, Hotel Drake.
- Jan. 28-Feb. 4—Chicago, National Automobile Show, Coliseum. Auspices of N.A.C.C.
- Feb. 6 to 11—Seventh National Tractor Show and Educational Exposition, Minnesota State Fair Grounds, Minneapolis.
- Feb. 6 to 11—Winnipeg, Can., Automotive Equipment

Show, Western Canadian Automotive Association.

## FOREIGN SHOWS

- March, 1922—Santiago, Chili, Annual Automobile Show.
- April 16—Mexico City, Annual Automobile Show, Auspices of the Automotive Division of the American Chamber of Commerce.
- April 22-May 1—Prague, Czechoslovakia, Fourteenth International Automobile Exhibit.
- May, 1922—Quito, Ecuador, Agricultural Exposition, celebrating Centenary of Ecuador. Automotive Section.
- Sept. 1922—Rio de Janeiro, Brazil, Automobile exhibits in connection with the Brazilian Centenary Association Automobilista Brasileira.

## CONVENTIONS

- Dec. 20—Philadelphia, American Society of Mechanical Engineers.
- Dec. 27-29—Chicago, American Society of Agricultural Engineers, Auditorium Hotel.
- Jan. 17-20, 1922—Chicago, American Road Builders Association.
- Jan. 30-31—Chicago, Fifth Annual Convention, N. A. D. A., La Salle Hotel.
- Jan. 30-Feb. 2—Boston, Sixth Annual Conference of the International Delivery Association, Copley Plaza Hotel.
- May 10-12—Philadelphia, Ninth National Foreign Trade Convention of the National Foreign Trade Council.

- June 11-15—Milwaukee, Annual International Convention of the Associated Advertising Clubs of the World.
- Sept. 18-23, 1922—Rome, Italy, Second Annual Meeting of the International Chamber of Commerce.

## S. A. E. MEETINGS

- Detroit, Dec. 23, Feb. 24, Mar 24, April 28, May 26.
- New York, Jan. 10-13, 1922—Annual Meeting.
- New York, Jan. 16, First Annual Meeting of Advisory Board on Highway Research, Engineering Societies Building.
- Chicago, Feb. 1
- Minneapolis, Feb. 8-9—Annual Tractor Meeting.

## Price Plan Violates Sherman Trust Law

### Supreme Court Hands Down Decision Affecting Conduct of Associations

(Continued from page 1245)

cident to the industries and the commerce of this country.

That the only alternative for the continuation of trade association work such as that carried on by the hardwood producers lies in legislative action, is the opinion of L. C. Boyle of Washington, general counsel for the American Hardwood Manufacturers Association. In his opinion the decision makes it absolutely impossible for industrial groups to study their economic problems and as a consequence "it is a stranglehold upon progress." Attorney Boyle said he probably would ask for a rehearing of the case, but admits that motions of this kind are very rarely granted.

The Government's bill in this case was devoted almost exclusively to the distribution of information through market letters and the acquiring of trade data by means of questionnaires. In the opinion of Justice Clarke, the market letters were not the controlling influence, but the plan whereby statistics were exchanged as to past conditions.

The market letters of which the Government complained were sent to the membership weekly and, as prepared by the manager, discussed various subjects of interest to the trade. The Government insisted that they were devoted principally to conditions affecting production and other elements which control prices. The questionnaires which were sent out were declared by the court to have much to do with future sales and production.

Justice Brandeis and Justice Holmes delivered dissenting opinions. These opinions developed the situation as contended by the industry. Justice McKen-

na joined Justices Brandeis and Holmes.

Delivering the dissenting opinion, Justice Brandeis said:

It may be that the distribution of trade data, editorial comment, and conferences enabled the producers to obtain on the average higher prices than would otherwise have been possible. But there is nothing in the Sherman law to indicate that Congress intended to condemn co-operative action in the exchange of information merely because prophecy resulting from comment on the data collected may lead, for a period, to higher market prices.

He declared that the plan had a tendency to promote desirable competition "by substituting knowledge for ignorance, rumor, guess and suspicion. It tends also to substitute research for gambling and piracy, closing the door to adventure or lessening the value of prophetic wisdom. In making such knowledge available to the smallest concerns, it creates among producers equality of opportunity, making it available also to the purchasers and general public. It does all that can actually be done to protect the community from extortion."

### Justice Brandeis Fears Centralization

Furthermore, Justice Brandeis said:

The refusal to permit a multitude of small rivals to cooperate as they have done here in order to protect themselves and the public from the chaos and havoc wrought in their trade by ignorance, may result in suppressing competition in the hardwood industry. Keen business rivals, who sought through cooperative exchange trade information to create conditions under which alone rivalry and competition is possible produced in the aggregate about one-third of the hardwood lumber of the country.

Justice Brandeis directed attention to the decision of the court in the steel corporation case in which it was held "that it was not unlawful to invest in a single corporation control of 50 per cent of the steel industry of the country and in the United Shoe Machinery case where the court held it was not unlawful to vest in a single corporation control of practically the whole shoe machinery industry." Justice Brandeis fears that the decree will lead to consolidation and centralized control of industries.

## Willys Receivers Working Out Plans

### Reduce New York Office Staff—Sale of Chrysler Plant Pending

NEW YORK, Dec. 20.—C. O. Miniger, who is one of the receivers for the property of the Willys Corp. in all districts, has held conferences with his co-receivers and plans are being worked out rapidly for the continuance of operations on an economical basis. Inasmuch as the affairs of the corporation are now exclusively in the hands of receivers, it has been found possible to dispense with the services of most of the office staff at the executive headquarters in New York. Those who have retired include D. J. Welch, who has represented the bankers as treasurer of the company.

No announcement has been made as to plans for the sale of the Chrysler plant at Elizabeth which probably will include the Chrysler car upon the development of which \$1,500,000 has been spent. It is understood, however, that negotiations are now pending.

Miniger and his co-receivers have designated C. R. Burt, president and general manager of the New Process Gear Corp. as their manager for the property within the northern district of New York. Business in the Syracuse plant will be continued as usual except that operations will be expanded rather than contracted. The same probably will be true in the Electric Auto-Lite plant at Toledo. It is significant that on the trip to Syracuse the receivers were accompanied by Arthur W. Loasby, a vice-president of the Equitable Trust Co. of New York and a member of the bank creditors' committee.

### CULTIVATOR CREDITORS SUE

# Waltham Speedometers

SCIENTIFIC research for the ideal speedometer has covered a period of many years. The result is the Waltham Air-Friction Speedometer—a perfect speed and mileage registering device developed and perfected by the Waltham Watch Company.

The Waltham is the only Air-Friction Speedometer in the world. Unlike other speedometers, it registers instantly, and accurately; it does not wobble. Climatic and temperature changes cannot affect it—oil cannot harden, or dirt and grease collect in its mechanism.

Waltham Speedometers have been adopted as standard equipment by such leading manufacturers as Cunningham, Daniels, Fergus, Lafayette, Leach-Biltwell, Lincoln, Packard, Pierce-Arrow, Renault, Rolls-Royce, Stevens-Duryea, Wills-Sainte Claire.

If you will call at any agency, where these cars are sold, you will be shown a car upon which the Waltham Speedometer will register accurately and instantly every variation of speed and mileage exhibited.

Regardless of the car you buy, be sure it is equipped with a Waltham Speedometer.

Waltham Watch Company, Waltham, Mass.

## Crude Petroleum Survey Shows Need for Fuel Conservation

Mexican production, 20% of U. S. consumption in 1920, is falling off. Domestic consumption has not kept pace with demands. Automotive industry has definite duty in research and conservation. Here is a survey of 1921 and an evaluation of the future.

By Joseph E. Pogue\*

THE importance to the automotive industry of an adequate commercial supply of crude petroleum is obvious. Automotive transportation has grown to such tremendous proportions that even those who are closest to this field find difficulty in visualizing its ramifications; and yet this vast structure is absolutely dependent upon the flow from about 270,000 oil wells in this country and about 300 wells in Mexico, every one of which has a natural tendency to decline in output. What are the prospects that new wells may be drilled in sufficient numbers to support the normal growth in automotive fuel requirements? This is a pertinent question, for each year a growing number of successful new wells must be completed merely to compensate for the decline in the production of old wells, and after this is accomplished an additional quota of new wells is prerequisite to any increase in aggregate output. Moreover, the Mexican wells, which in 1921 produced nearly half as much petroleum as was raised to the surface in the United States, are rapidly being destroyed by the invasion of salt water. Should the Mexican supply fail, or even decline sharply, a supply that in 1920 filled 20 per cent of our petroleum needs and 9 per cent of our gasoline requirements, a still

greater burden would fall upon our domestic oil fields and it would be questionable whether the full requirements of our ten million motor vehicles could be met without considerable readjustment.

In 1921 the United States produced approximately 465,000,000 barrels of crude petroleum, imported about 120,000,000 barrels, and consumed about 516,000,000 barrels. These figures, though striking in magnitude, carry little significance if viewed for a single year. It is far more important to know the rates at which these items have been growing and to compare these rates of increase with one another. The problem is dynamic, not static.

A comparison of the production of crude petroleum in the United States with the quantity of crude petroleum imported into this country is afforded by Fig. 1 for the 9-year period, 1913-21. The data are plotted on a ratio scale in order that the slopes of the curves may be proportional to their percentage changes and hence directly comparable. Then the trend of production and the trend of imports are determined by fitting straight lines to the data by the mathematical method of least squares, and these trend lines entered on the chart. The trend lines may be looked upon as the "normal" course of the items, around which the actual figures fluctuate from year to year.

\*Consulting engineer, New York.

Fig. 1—Trend of domestic production and imports of crude petroleum in the United States by years, 1913-21

The trend is shown in the following table:

Year	(Relative to 1913)						
	Domestic Production, Million Bbls.	Imports, Million Bbls.	Domestic Consumption, Million Bbls.	Imports in Per Cent of Domestic Consumption	Domestic Production	Imports	Domestic Consumption
1913 ..	248	17.8	262	6.8	100	100	100
1914 ..	266	17.2	261	6.6	107	97	100
1915 ..	281	18.1	273	6.6	113	102	104
1916 ..	301	20.6	319	6.5	121	116	122
1917 ..	335	30.2	378	8.0	135	170	144
1918 ..	356	37.7	413	9.2	143	212	158
1919 ..	378	52.8	418	12.6	152	297	160
1920 ..	443	106.0	531	20.0	179	596	203
1921 <sup>1</sup> ..	465	118.0	516	22.8	187	663	197

<sup>1</sup>Estimated.

It is apparent from Fig. 1 that the average increase in the domestic production of crude petroleum during the period shown was 8.3 per cent, while imports increased at the much faster rate of 30.2 per cent. This disparity in growth is strikingly shown by the rapid convergence of the two trend lines on the chart. If we bear in mind that the curves follow the compound interest law, with rates of 8.3 per cent and 30.2 per cent respectively, compounded continuously, we gain some idea of the remarkable degree to which these items have been advancing, particularly imports.

This method of analysis measures accurately the *tendency* of the items, but cannot give assurance that the trends will continue in the future as they have in the past. The rational deduction would rather be that such phenomenal rates of increase must of necessity slow down. Should imports, for example, continue to 1930 at the rate of 30.2 per cent, this country would then be receiving from abroad the incredibly large total of one billion barrels per annum! Such a volume of

imports, needless to say, is not to be expected, and the calculation is given merely to show how inordinately our dependence upon imported petroleum has been recently growing.

Having observed the trend of the supply of crude petroleum, we may turn next to certain aspects of demand. Fig. 2 shows, on a ratio scale, domestic production of crude petroleum compared with consumption and with price. The data, as in the first instance, have been plotted and then fitted with trend lines by the method of least squares; that is to say, through each curve has been drawn a straight line which expresses the general trend or direction of the curve more closely than any other straight line that might be constructed. It is apparent at once that consumption has been increasing at the rate of 10.4 per cent a year, thus outdistancing domestic production with its rate of 8.3 per cent. We now have an accurate measure of the growth of production and consumption, and it will be clear that the greater growth of consumption as compared with production has been sustained only by virtue of a still greater rate of increase in the growth of imports.

The rapid growth in the consumption of crude petroleum in the United States may be strikingly visualized by reducing the figures to a per capita basis, as shown in the following table and expressed graphically in Fig. 3:

Year	Barrels per person	Year	Barrels per person
1909 .....	1.84	1916 .....	3.19
1910 .....	2.07	1917 .....	3.70
1911 .....	2.25	1918 .....	3.99
1912 .....	2.52	1919 .....	3.98
1913 .....	2.72	1920 .....	4.98
1914 .....	2.67	1921 <sup>1</sup> .....	4.57
1915 .....	2.75		

<sup>1</sup>Estimated.

Fig. 2—Trend of domestic production, consumption, and average price of crude petroleum in the United States by years, 1913-21. Note especially the different rates of increase of the three items

Coupled with the enlarging disparity between domestic production and consumption, the price of crude petroleum has been advancing, as also shown in Fig. 2. The price curve represents the weighted average price of crude petroleum in the United States. The trend of this item, as determined by the method of least squares, indicates an average increase of 17 per cent a year. Closer examination of the price curve reveals the extent to which the price of crude petroleum receded in 1921, when it fell about the same degree below "normal" as it did under quite similar circumstances in 1915. The 1921 drop in price was contemporaneous with a decline in consumption and a slowing up in domestic production. In addition to the trend relationships of the three curves of Fig. 2, the detailed variations show a consistency that is interesting and significant, the three tending to accelerate or decelerate in unison.

We have now had, perhaps at the risk of some tedium, an accurate measure of the rates of growth of the principal factors entering into the supply of crude petroleum. Again, it should be emphasized that the differences in the rates of growth of the several factors are fundamentally important and give a valuable clue to the developments that lie ahead.

Reverting to the price of crude petroleum which, as we have seen, has increased 17 per cent a year, on the average, over the past nine years, the question naturally arises as to whether this advance is merely a part of the general increase in prices or represents a fundamental increase as compared to the general price level. This is an important question, because if crude petroleum is really becoming more costly as compared with other commodities, that fact will have an important bearing upon automotive transportation. To arrive at an answer to this question, the actual price of crude petroleum was corrected for the variation in the pur-

Fig. 3—Per capita consumption of crude petroleum in the United States by years, 1913-21

chasing power of the dollar and a new price in terms of 1913 dollars arrived at.

The course of the actual price, together with a curve of this relative price is given in Fig. 4, where it will be seen that the price as expressed in 1913 dollars has an unmistakable upward trend over the sixteen-year period shown. By fitting a straight line to the price as expressed in 1913 dollars, using the method of least squares, the trend of this item is determined to be upward at the rate of 3.5 per cent a year, compounded continuously. We thus arrive at a measure of the funda-

Fig. 4—The actual average price of crude petroleum in the United States compared with the deflated price as expressed in 1913 dollars, by years, 1905-21

Fig. 5—The actual average price of crude petroleum in the United States compared with the deflated price as expressed in 1913 dollars, by months, 1920-21

mental upward trend of the price of crude petroleum, upon which is superimposed an additional advance by virtue of the upward move in the general price level.

#### Average Prices

Year	Average Price of Crude Petroleum. In actual Dollars	Average Price of Crude Petroleum. In 1913 Dollars	Year	Average Price of Crude Petroleum. In actual Dollars	Average Price of Crude Petroleum. In 1913 Dollars
1905 ..	.61	.72	1913 ..	1.14	1.14
1906 ..	.68	.77	1914 ..	.93	.93
1907 ..	.73	.78	1915 ..	.75	.74
1908 ..	.70	.77	1916 ..	1.33	1.07
1909 ..	.69	.71	1917 ..	1.77	1.00
1910 ..	.63	.64	1918 ..	2.22	1.13
1911 ..	.66	.69	1919 ..	2.25	1.06
1912 ..	.80	.79	1920 ..	3.44	1.42
			1921 ..	1.86	1.20

<sup>1</sup>Estimated.

This fundamental upward trend is to be attributed to the increasing cost of maintaining our domestic production through deeper wells and enlarging field activities. This residual price trend, it may be added, offers a scientific means for forecasting the minimum price advance that may be expected in the future, although a shortage in supply would accelerate the rise from such a minimum.

The deflated price of crude petroleum will repay further study. Accordingly the actual and deflated prices are plotted by months over the past two years, as shown in Fig. 5. The curve representing actual price depicts the price history of crude petroleum during 1920 and 1921, showing clearly the high level reached in 1920, the precipitous decline suffered during the first half of 1921, and the sharp upward reaction that characterized the fourth quarter of the year. The curve representing

remarkable rate of increase in imports from Mexico. Such is the balance between the major factors in supply. Had it not been for the prolific oil-pools of Mexico, either our supply of crude petroleum would have already fallen short of requirements, or else domestic fields would have been forced to higher productivity under the impetus of a higher price level. These alternatives, neither wholly satisfactory to the automotive industry, lead us to the crux of the situation—the impending decline in imports owing to the rapid exhaustion of the proven oil-pools of Mexico. An appraisal of this factor requires a careful examination of the evidence as regards the condition of the Mexican fields.

In 1920 Mexico produced 24 per cent of the world's output of crude petroleum, or 37 per cent of the production of the United States, with slightly greater proportions in 1921. Most of the Mexican output is consumed in the United States, and the relative importance of this increment is indicated by Fig. 6, which shows our consumption of crude petroleum over the past nine years divided into the part contributed by domestic fields and the part supported by imports from Mexico.

Practically all the oil thus far produced in Mexico has come from a restricted zone on the Gulf Coastal Plain, a few miles inland from Tampico and Tuxpam. The productive area (see Fig. 7) is divided into the Northern Field, yielding heavy crude almost devoid of gasoline, and the Southern Field, producing light refinable crude with about a 12-15 per cent gasoline content. The Northern Field has been producing about one-quarter of the total output of the country; the Southern Field, about three-quarters. Each field comprises a number of individual oil-pools, as shown in Fig. 7.

The oil occurs under remarkable geological conditions, without parallel elsewhere in the world. It occupies porous and cavernous portions of a limestone formation in proximity to intrusive masses of igneous rock and rests upon a salt water table under artesian head. In consequence, when a pool is tapped, the productivity of the well is phenomenal, but its life under unrestricted flow is apt to be relatively short and finally the water level rises and the well ceases to produce oil, but instead becomes an artesian well. These conditions have enabled the producer to deplete through a few wells and within a brief period of years a reserve of oil that under ordinary conditions would have required thousands of wells and several decades to exhaust. The Mexican pools to date have produced about 700 million barrels of crude petroleum, and there are probably about 200 to 300 million barrels of proven oil still remaining to be produced, not counting future developments and discoveries.

But, here again, the fundamental question is not a matter of magnitudes, but of rates. This distinction cannot be stressed too strongly. The question is not how much oil we are going to recover eventually, but how rapidly we are going to get it. This has been the controlling factor so far and bids fair to continue so.

The salt water, which underlies the oil in the Tampico-Tuxpam area, is rapidly encroaching upon the productive oil-pools. During 1921 many of the pools became extinct, some with sensational suddenness. So far the aggregate output of the country has not fallen to a degree suggested by these events, since a decline in some of the pools has been partly compensated by an increase in productivity of the less exhausted deposits. So large are the individual wells that a given pool may be made to produce with almost unbroken intensity up to the very end—a condition in marked contrast to the performance of pools in the United States which display a prolonged period of declining output before exhaustion.

Fig. 6—Percentage analysis of the consumption of crude petroleum in the United States by years, 1913-21, showing the ratio of the imported to domestic supply

deflated price brings out certain additional features, especially the growing resistance experienced in 1920 in holding up against the decline in the general price level and the amazingly low level reached in August and September of 1921.

The analysis to this point may be summarized: A rapidly mounting consumption of crude petroleum in the United States has been supported by (a) a marked, but less rapid, increase in domestic production, (b) a rising price level for domestic petroleum in the course of exploiting deeper and more extensive pools and (c) a

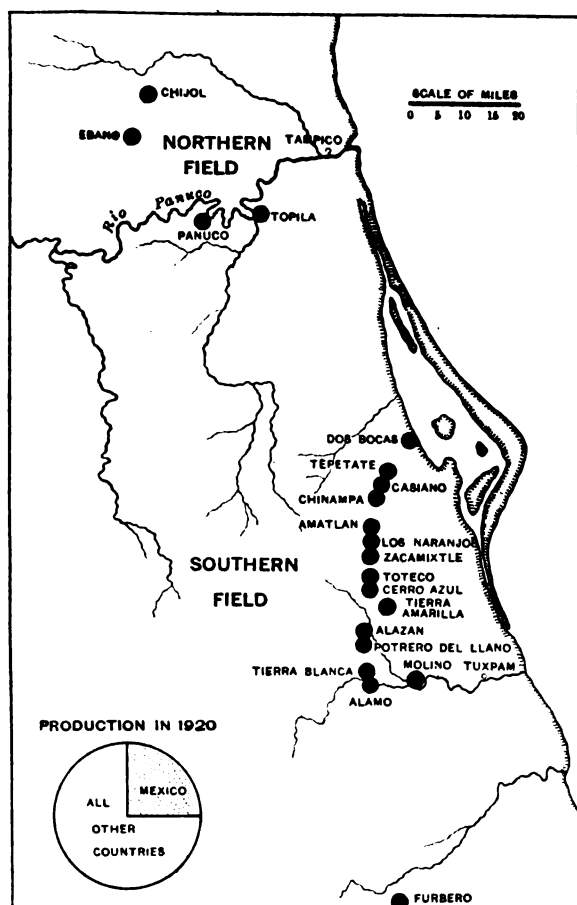

Fig. 7—Sketch map showing the location of the important proved oil-pools of Mexico. Many of the pools shown are extinct. (After Pogue, *The Economics of Petroleum*)

The seriousness of the situation in the Mexican oil-fields may be perhaps most convincingly conveyed by a series of quotations from informed individuals who have publicly expressed themselves on the subject.

In March, 1921, Ralph Arnold, a well known petroleum engineer, stated in *Mining and Metallurgy*, a publication of the American Institute of Mining and Metallurgical Engineers:

"Mexico is now producing at the rate of about 600,000 bbl. per day; approximately two-thirds of this is coming from Los Naranjos, a pool which will probably be extinct by early summer on account of the encroachment of salt water. If the present rate is maintained throughout the year, 1921 will see about 220,000,000 bbl. of oil brought to the surface in Mexico, or about one-half the probable production of the United States for the year. But Mexico's proven reserve is less than twice this amount, hence, at the present rate of production, the latter part of 1922 will see the end of the proven big fields in Mexico. There is little wildcatting going on in Mexico now, probably not over 25 strictly wildcat wells now being actively drilled outside the main producing district. Whether it is 1½ years or 2 years, or even a little longer or a little less before the break comes, it is certain to come."

In September, 1921, L. G. Huntley and Stirling Huntley, two petroleum geologists, published an article in *Mining and Metallurgy*, in which they described the salt water flooding of the Mexican pools, but expressed the opinion that a reduced yield could be maintained for several years until new fields in Mexico could be developed.

"...after all the southern pools have been flooded," they stated, "there will still be a production in the Mexican fields of 250,000 barrels per day at the end of 1000 days from July 1, 1921 (Dec. 1, 1924) on the assumption that the new drilling in the Panuco River field increases

production....It seems probable that the present fields will continue to produce oil in large quantities during the time necessary to carry on prospecting for additional pools....However, the opening up of these new fields will require new roads, railways, and pipe-lines....Costs of producing and operating will be higher than in the past, wells, in general, will be smaller, fields will be more disconnected."

In October Roy H. Flamm, expert, Latin-American Division of the U. S. Bureau of Foreign and Domestic Commerce, published in *Commerce Reports* a detailed compilation on the petroleum industry in Mexico, in which he said:

"The older fields of Mexico will continue to give oil for a considerable time to come, but such production probably will be increasingly smaller from the peak of 1920-21. Many of the wells now being developed in the Amatlan pool show tendencies to develop salt water more rapidly than heretofore."

Later on in the article Mr. Flamm apparently contradicts his earlier conclusion in stating:

"The present fields in Mexico will continue their large production for a sufficient time necessary to develop known areas and to wildcat less known territory." He adds: "It is expected that the cost of production and operation in the future will be higher than in the past, due to the fact that the wells will be smaller, the fields more disconnected, taxation higher, and Government regulations more stringent."

In an address before the annual meeting of the American Petroleum Institute in Chicago on Dec. 8, Harry F. Sinclair, chairman of the Board of Directors of the Sinclair Consolidated Oil Corporation, said:

"We are told that the Mexican fields are doomed. It must be admitted that the situation there is serious, but although I personally believe that the Mexican produc-

Fig. 8—Current trend of domestic production and imports of crude petroleum in the United States by months, 1918-21

tion will be as great ten years from now as it is to-day, we cannot safely, as American citizens, disregard the possibility that the Mexican production may fall to an insignificant total, at least temporarily, and that Mexico may disappear as a real petroleum factor until new Mexican fields are discovered."

"Mexico, last year, produced 23 1-3 per cent of the world's total production of petroleum. If Mexico drops out, what will be the effect on the petroleum situation? What will be the effect on the United States? Can

Fig. 9—Trend of oil-field activity in the United States (exclusive of California) by months, 1918-21

you cut off a quarter or a fifth of the world's production without placing a strain upon the petroleum market of the United States?"

"A large part of the Mexican production comes to this country. Suppose that source of supply were shut off. Some will point to our large stocks of crude oil in storage. But do you realize that the total quantity of crude oil above ground in this country is only about four months' supply?"

The December number of *The Lamp*, an official organ of the Standard Oil Company of New Jersey, discusses the Mexican oil situation in some detail, stating among other things:

"It is the belief of some producers that districts now yielding about 500,000 barrels of oil a day will be practically exhausted in the latter part of 1922. These are the fields from Tepetate to and including Cerro Azul... all of the oil taken from Mexico to-day has come from big wells, where the cost per barrel has been down to minimum. If Mexico is to continue to figure it will be necessary to assume the heavier cost per barrel of getting oil from small wells. This is not justified by the prevailing margin of profit after paying taxes... Since the prospects of the practical exhaustion of the southern fields has become real, the complications of Article 27 of the Mexican Constitution, together with political unrest and inadequate protection for workers, have effectively limited wildcatting."

In the *Economics of Petroleum*, published in December, the present writer expressed an opinion on the Mexican outlook in these words:

"The output of Mexican petroleum is probably due for a slowing down in the period immediately ahead. If the rate of production of early 1921 is sustained, 1922 may see the end of the proven big fields of Mexico. On the other hand, special conditions may lead to a reduced rate of output earlier and a consequent spread of the remaining supply over a period of years. In either event, new productive pools, either in the Tampico-Tuxpam area or elsewhere in Mexico, can scarcely be developed with sufficient celerity to maintain an unbroken increase in that country's production of petroleum."

The conclusions quoted above, coming both from technical and commercial sources, are perhaps sufficient to indicate that the production of crude petroleum in Mexico at best cannot be expected to increase during the next few years and at worst may fall to a startlingly low level during 1922. It also appears certain that the cost of producing petroleum in Mexico is bound to advance and the flood of cheap Mexican oil which has come upon the American market during recent years will soon be a thing of the past.

What effects will these developments have upon the domestic petroleum situation? Fig. 8, comparing the growth of production and imports of crude petroleum by months during the past few years, should be examined with this question in mind. The significance of a downward trend in imports will then become clearer. One-quarter of our supply of crude petroleum would in that event gradually withdraw its support at a time when our requirements are increasing. Mexico, therefore, holds the possibility, in fact the probability, of throwing a greatly increased burden upon our domestic oil-fields. Let us now examine domestic production with a view to determining its capacity for expansion.

We have previously seen that domestic production during the past nine years has been increasing at the annual rate of 8.3 per cent, compounded continuously, and this rate of increase has been supported by a fundamental increase in price of 3.5 per cent annually over and above an increase due to the rise in the country's general price level. Production statistics are informing in respect to tendencies, but give no assurance of what may be expected in the future; there are data, however, that have usefulness in this direction and these are records of drilling activity as compiled from month to month by certain of the oil journals, notably *The Oil and Gas Journal*.

Fig. 9 brings together in graphic form the more significant of the well data for the oil-fields east of California. The data are plotted by months over the past four years. The most striking feature of the chart is the upward trend of the curve representing the number of oil-wells completed and the notable downward departure from this trend during 1921. If we fit a straight line to the curve representing the number of oil wells completed for the three years, 1918-20, by means of the method of least squares (excluding 1921 because of its obviously abnormal character), we find that the "normal" increase in successful well completions necessary to support our increase in production of 8.3 per cent is 18.2 per cent. In other words, oil-field activity, before the slump of 1921, was speeded up to the phenomenal rate of 18.2 per cent per year and this was only capable of maintaining an increase in production of 8.3 per cent.

Reasoning further along the same line, and for the moment eliminating from consideration variations in the size of new wells, we find that in order to sustain production at its past rate of 8.3 per cent, we should have drilled 28,000 successful wells in 1921 (instead of approximately 14,000), and in 1922 should drill 33,000 wells. As a result of a decline in drilling during 1921 of 50 per cent from "normal," the rate of increase in domestic production has slowed down during the second half of 1921 to approximately 0, that is, production is barely being maintained at an even level. To advance drilling to a total of 33,000 successful wells in 1922, even granted that such expansion could be financed, would not compensate for the momentum lost during the restricted drilling of 1921. The conclusion to be drawn from this rather tedious line of reasoning is that our past rate of domestic production has already slowed down and cannot be forced up to its former rate of perform-

ance without the intervention of a tremendous campaign of drilling over the next few years such as could be expected, if at all, only under the impetus of further and perhaps drastic rises in price.

The analysis as drawn in the preceding paragraphs is in broadest outline merely. There are many fluctuations which temporarily tend to upset any deductions drawn from past performance. For example, the exploitation of the Mexia Pool in central Texas during the fourth quarter of 1921 has contributed oil to the extent of about 8 per cent of the country's entire production. This sudden increment to supply has, for the time being, partly offset the effect of curtailed drilling at large. Such sensational developments are always possible in oil, but their effect is progressively less from year to year; five years ago a pool the size of Mexia might have already broken the market by creating a great surplus of oil. The Mexia Pool has recently displayed some disquieting signs of being short lived.

Reference again to Fig. 9 will disclose that during the past twelve months the number of oil-wells under way in the oil-fields of this country exclusive of California has declined about 50 per cent, the curve representing this item synchronizing closely with the curve of oil wells completed. The marked rise of the former curve during 1919-20 is very suggestive of the intensive and even feverish campaign of oil-field development that was waged in those years. Coincident with the decline

in drilling since the middle of 1920, there has been an increase in the productive size of the new wells completed. This feature is clearly shown by the curve in Fig. 9 marked "initial daily production per well completed." The explanation is that during the industrial depression such wells as were drilled were almost exclusively confined to the best-proven territories where the chances of tapping rich deposits were a maximum. In other words, the decline in drilling that characterized late 1920 and 1921 was largely a decline in explorational drilling, as contrasted with developmental drilling. This fact will tend to retard an increase in production, since exploration must, of course, precede development. For the past eighteen months we have been using up our blocked out ore, so as to speak.

Bringing together, in conclusion, the various strands of our argument, we find (a) domestic production of crude petroleum slowing down, and (b) imports threatening to decline with sharp curtailment probable upon further exhaustion of the proven oil-pools of Mexico. Should the demands for oil fail to fall off proportionately, we may expect to see an increased burden placed upon our domestic oil fields, such as will accelerate the rising price level of crude petroleum. Should domestic production not be able to respond quickly enough under this impetus the alternative will be a readjustment in consumption pending the development, if possible, of adequate foreign sources of supply.

## Level Gages Operating on the Hydrostatic Principle

**A** LINE of gasoline and oil gages without moving parts has been brought out by the Laduna Products Co. The action of these gages is based entirely on the hydrostatic balance of inelastic liquids.

For the gasoline gage a tubular receiver is inserted into the gasoline tank, and from this receiver two small brass pipes are led to the gage proper on the dashboard. The indicating red level in the glass tube of the gage registers the contents of the tank in gallons. The gage is said to be very sensitive and accurate at all points of its scale, there being no lost motion in the parts of the apparatus.

The receiver may be removed from the tank and replaced without affecting the accuracy of the apparatus, provided the pipes are not disconnected. The gasoline

Laduna gasoline gage

also may be completely drained from the tank, as, for instance, for railroad transportation over a short distance. For a long-distance shipment and for winter storage it is necessary, in order to prevent the evaporation of the liquids in the tubes, to lock the receiver by giving a half turn to the locking tube.

The readings of the gage are said to be unaffected by the various driving conditions, especially if the receiver is placed in the center of the tank. The indicating level remains stationary and quiet under fast driving on rough roads, hills and curves when accelerating or braking.

The temperature effect on the pipes is nearly balanced and made practically negligible. The scale may be easily adjusted for correct readings for winter or summer conditions by simply giving an adjusting screw a turn.

The oil gage has a receiver fitted into the crankcase from the bottom. This receiver may be also removed and replaced without disturbing the accuracy of the gage.

These gages were invented and developed by the Russian scientist, L. A. Dunajeff.

# Original Engineering Features in New Six-Cylinder Car

Extra flywheel at front of engine is said to minimize vibration and permit wide speed range on high gear. Cylinders and half of crankcase are in one piece, but bell housing and chain case are bolted on units. This is done to facilitate production. Cone clutch running in oil is employed.

By J. Edward Schipper

**T**HE new Rickenbacker six, which is now in production and will be introduced to the public at the New York show, has been designed and will be manufactured almost entirely by the Rickenbacker Motor Co. in the Detroit plant originally erected by the Springfield Metal Body Co., and later known as the Dissteel Wheel Plant of the Detroit Pressed Steel Co. The production schedule calls for 12,000 cars the first year, and the factory is tooled up in a way to make this number or a greater quantity easily attainable.

The new car is of considerable interest because it incorporates departures from usual engineering practice, as well as original ideas from a production standpoint. When it is considered that the car will sell for under \$1,500, according to factory officials, although the price will not be announced until the New York show, the speed range and general construction are particularly noteworthy. The touring car, ready for the road, incorporating a six-cylinder, block cast engine, weighs 2650 lb. The wheel base is 117 in. The car has a speed range of from 2 to more than 60 miles per hr. on high gear. In driving over roads around Detroit the writer was unable to detect any engine period between 3 and 63 m.p.h., and on allowing the engine to race while idle, practically no vibration of the fender or other sheet metal parts was discernible up to very high speeds.

Outstanding features of the car are its heavy box construction frame, flywheels at front and rear of the engine, and extra long rear springs. A number of new processes are used in manufacturing. The cylinder block and the upper part of the crankcase, which latter is of deep section for rigidity, are cast together. The cylinder bore is  $3\frac{1}{8}$  in. and the stroke is  $4\frac{3}{4}$  in., giving a stroke-bore ratio of 1.52. The block casting is so designed that the chain case and the flywheel housing are bolted on, thus simplifying the casting and the machining processes. The cylinder bores are given a ground finish and because of the elimination of the usual unit bell housing, the casting makes an exceptionally good

manufacturing proposition, easy to handle in the shop.

With a clearance volume of 21 per cent of the total volume the engine develops 58 b. hp. at 2800 r.p.m. With a displacement of 218 cu. in., this is at the rate of 3.76 cu. in. per hp. The final drive ratio is 4.63 to 1, with 32-in. tires. The cylinder heads are cast separately and incorporate the combustion chambers, which are machined completely and polished to prevent carbon accumulation.

The pistons are of cast iron and are  $4\frac{1}{4}$  in. in length, in accordance with the trend toward long pistons. Three piston rings are used, these being of the hammered type,  $\frac{3}{16}$  by  $\frac{1}{8}$  in. The piston pin bears in the piston bosses and is  $\frac{3}{4}$  in. in diameter by  $2\frac{3}{4}$  in. in length. The nominal piston clearance at the top is 0.011 in. and at the bottom, 0.00325. The pistons are finished by grinding and the bottom of the piston is provided with a sharp cutting edge to act as an oil scraper. The

Five-passenger Rickenbacker touring car

bottom surface on each of the three piston rings is also finished in the same manner so as to remove the oil from the cylinder walls on the downward stroke. It is claimed that in tests with this type of piston as many as 150 miles have been attained to a pint of oil.

The connecting rods are drop forgings with a heavy babbitt liner at the large end. The feature of the connecting rods is the method of finishing. It is usual practice to check the alignment of the rod on a gage, and if it is not true, to bend the rod to check properly on the gage. On the Rickenbacker car, on the contrary, the small end of the connecting rod is ground to assure alignment. This process was developed by several manufacturers in grinding connecting rods for airplane engines during the war. The alignment is for the purpose of eliminating side friction of the piston, which insures an easier and smoother running engine, and will have a tendency to eliminate scoring. The lower connecting rod bearing is  $1\frac{3}{4}$  in. in length by 2 in. in diameter.

The crankshaft is a three-bearing type, the nominal diameter of the shaft being  $2\frac{1}{4}$  in. The shaft is dynamical-

Longitudinal elevation, sectioned, of Rickenbacker power plant

ly balanced and is of the curved cheek type. It is a Wyman-Gordon forging. An unusual feature of the crankshaft and flywheel assembly is that there are flywheels at both ends, of about equal weight. This breaking up of the flywheel into two parts is claimed to have a great deal to do with the smoothness of the engine. The total flywheel weight is about 50 lb. The crankshaft bearing dimensions from front to rear, diameter and length, are:  $2\frac{1}{4}$  by 2-3/16 in.,  $2\frac{1}{4}$  by  $2\frac{1}{2}$  in.,  $2\frac{1}{4}$  by 2-5/16 in.

A Morse chain is employed for the front end drive. The chain runs over three sprockets, one on the crankshaft, one on the camshaft and the other on the generator and water pump shaft. The latter shaft is provided with a screw adjustment to take up slack in the chain.

The drive for the oil pump and distributor is taken from the camshaft by helical gears. The ignition distributor is placed in a very accessible position on the top of the cylinder head at about the center of length, which keeps the ignition device away from oil and water and also shortens the length of the high tension leads. The oil pump is driven from the bottom of the same shaft, which gives a balanced drive for these two units.

The valve drive is conventional in layout, the valves being on the left side of the engine and driven by push rods of the mushroom type. The guides are in groups of six and are readily removable without taking off the cylinder block. The valve material is the same

for both the intake and exhaust valves, the head being of cast iron and the stem of cold-rolled steel. The valve diameters are  $1\frac{1}{2}$  in. in the clear, with a lift of 5/16 in.

Lubrication is by a pressure system, the oil passing from the pump at the center of the engine and at the lowest portion of the sump through a lead contained in the crankcase to the crankshaft, which is drilled to supply oil to all the main bearings and the connecting rods. There is a lead also to the extra bearing, which is provided at the extreme front end of the shaft to support the balancing flywheel. The oil pump assembly is accessible from the lower end of the engine and can be removed for inspection without dropping the bottom pan. The oil filler opening is large and high so that it is readily accessible and the pressure regulator for the oiling system is also accessible upon lifting the hood.

Cooling is by pump circulation, the centrifugal pump being located immediately behind the generator on the right side of the engine and driven through the generator shaft. Water enters the block at about the center of its length and is distributed both ways from this point. The water flows upward to the cylinder head casting, where it enters the water header and discharge pipe. The radiator is a cellular type and the water system has a capacity of 4 gal. The fan is a four-blade unit driven by a leather fan belt 1 in. in diameter from a pulley on the end of the camshaft.

The gasoline system is fed from a

Cross section of engine

Front end of Rickenbacker chassis, showing running board support and mounting of unit powerplant. Left side of Rickenbacker powerplant, showing ramshorn hot-spot manifold, two flywheels, fan drive and other details. Door pockets and pocket in rear of front seat for side curtains. Rear-end of frame, showing mounting of rear springs for Hotchkiss drive

21-gal. tank mounted in the rear of the chassis under a sheet steel cross-member, which is pierced for the filler and gage. Gasoline is fed from a Stewart vacuum tank to a  $1\frac{1}{4}$ -in. Stromberg carbureter. The intake manifold is of the ramshorn type with a hot-spot center, carrying the gases to the intake passages which are cored in the cylinder head and so arranged as to be in contact with the water spaces to prevent reconcondensation of the gases.

An inverted cone clutch of Rickenbacker design is used. This clutch has a Raybestos facing running in a bath of oil. It is claimed that the combination of the Raybestos facing and the oil bath eliminate any possibility of burning and, at the same time, insure a smooth action. The clutch on demonstration held perfectly when the car was started in high gear. The remaining power transmission units are conventional in design, the gearset being a three-speed unit with an aluminum transmission case. This same material is used for the rear flywheel housing. A transmission brake is employed for emergencies, this being a contracting band type mounted just behind the gearset. The propeller shaft is tubular with two Bowling Green universal joints. The final drive is through a floating axle with spiral bevel gears. The spiral gear ratio is 4.63 to 1.

The axle is housed in pressed steel and has  $1\frac{1}{2}$ -in. alloy steel shaft. The foot brakes are on the rear wheels and act on 14-in. drums. They are external contracting type with 2-in. Thermoid bands. The front axle is drop forged I-beam, with ball-bearing steering knuckle.

One of the interesting features of the car is the deep and wide section of the frame channels. There are seven cross-members and this, in combination with the wide flanges, gives exceptional rigidity. Picking up one corner of the frame from the ground, it can only be lifted  $2\frac{1}{2}$  in. before the other extremity of the same side member leaves the ground. Usually the spring in the frame, on lifting up one corner in this way, is 4 or 5 in., at least, and sometimes 7 and 8 in. Both the front and rear springs are long, the front being 36 by 2 in., and the rear 57 by  $2\frac{1}{2}$  in. The wheels are wood artillery with embossed spokes. The tire equipment is 32 by 4 in. cord with Firestone rims. The steering gear is a Gemmer, worm and wheel type.

Three types of body will be furnished. A five-passenger touring, four-passenger coupe and a five-passenger sedan. One of the body features is the windshield design which merges into the trim rail so as to provide a water-tight joint with the body. The windshield is

wider at the top than at the bottom, which eliminates the usual projection of the front corners of the top.

The body is of 20 gage, deep drawing steel. The doors are hung on concealed steel hinges and equipped with inside and outside handles of offset bar type. The rear fender merges into the body and frame, covering the springs and axle parts. The running boards are covered with linoleum bound with corrugated aluminum molding. The top is a one-man type with five bows designed to harmonize with the body lines. It is covered with pantasote, double lined, and equipped with a plate glass window 26 in. long by 7 in. deep. The side curtains are of the winter type with special rods attached to the doors. The curtains are carried in a pocket in

the back of the front seat, where they are accessible and at the same time are protected against dust and can be packed flat.

The rear cushion dimensions are 47 in. by 21 in. by 9 in. deep. This seat is reclining, and in common with the front cushion is upholstered over Marshall springs. The instrument board is equipped with an oil gage, and an ammeter in an oval panel. The speedometer head is provided with a cowl lamp just above the center, and in another oval panel are the starting and lighting switches. The steering wheel is all walnut. Lamp equipment consists of drum type headlamps finished in nickel and black, side or curb lamps attached to the windshield arms and tail light on license bracket.

## Refinement in Design of Band Brake

**H**ENRY M. CRANE is among the advocates of the band-type brake, providing it is properly constructed. A design incorporating the desirable features of this type of brake, prepared by Mr. Crane is shown in the accompanying cut.

One of the chief advantages of the band brake is the fact that it can be made to bear on almost the full circumference of the brake drum, whereas in the internal shoe-type brake it is difficult to secure an effective contact over more than one-half the circumference. The expanding shoe-type also tends to distort the drum, while there is no such tendency in the band type. Partly because of the large arc of contact, and partly for other reasons it is possible to make a band brake of given capacity much lighter than one of the internal shoe-type.

Smoothness in brake operation depends to a considerable extent upon using a low unit pressure on the braking surface. With the band type a low uniform pressure is readily secured in combination with a brake of adequate capacity and moderate weight. Smooth operation is also facilitated by providing a rigid brake anchorage.

Referring to the cut it will be noted that two narrow drums, placed back to back, are employed, and that two relatively narrow bands are used in place of a single wide band. There are two primary reasons for using this dual construction. In the first place, two narrow drums are less apt to distort due to heating than a single wide drum. In the second place two narrow bands are less likely to bear unevenly than a single wide band. Uneven bearing on a wide band may tend to cause chattering. By placing the brake drums back to back with spacers between and drilling holes in the web of the drum, air is drawn through the space between the drums and assists in cooling them.

A single, rigid anchorage is provided. The link K, attached to the anchorage at one end and to the band at the other, is held against the stop screw J by the spring L. The spring keeps the band lining out of contact with the drum at all times when the brake is in the off position. Two views of the linkage employed for operating the brake are shown. The operating shaft A carries a heavy bent arm, the outer end of which engages the hole C in the link D. The outer end of link D is pinned to the long arm of the lever E. This lever is pivoted on the pin F to which is attached the adjustable link G. The lower end of link G is pivoted in a fitting H riveted to one

end of the brake band. The other end of the brake band is connected to the short arm of lever E. A spring surrounding the link G holds the two ends of the band apart. The fitting H rests against the adjustable stop screw I in its off position. Motion of the long arm of the lever E away from the drum causes the two ends of the brake band to come closer together and brings the braking surface into engagement with the drum.

The brake band is rolled to a true circle, consequently, the brake cannot drag if the stops I and J are properly adjusted. It will be noted that the link D remains in a substantially radial position in all positions of lever E. This prevents any tendency there may be for the brake to jam or become self-acting due to the tendency of the braking friction to carry the band around.

It will be noted that the difference in the length of the arms of lever E is sufficient to give considerable multiplication of the pull applied to the long arm. This makes unnecessary other multiplication of pressure than that provided by the normal difference in the length of the two arms of the operating pedal.

The brake band is, of course, stiff enough to clear at all points, but it is sufficiently flexible to insure uniform contact pressure over the entire braking surface and thus distribute wear.

This brake is designed for application to the gearbox. The use of only a light pedal pressure is sufficient to easily lock the wheels of a heavy car even when there is oil on the braking surface. The use of a small quantity of oil on the brake is, in fact, recommended as a means for facilitating smooth operation and minimizing wear.

The brake drum is 12 in. in diameter and each of the two bands is 2 in. wide. The heavy anchorage bracket employed is shown at the right.

Crane design of band-type transmission brake

# Fuel and Lubrication Changes Feature New Premier Model

Fitted with Nelson vaporizer and aluminum piston, which latter has permitted a higher compression ratio. Output and economy of engine increased. Body lines have also been changed and instrument layout improved. Design of connecting rod bearing is somewhat different.

**T**HE Premier 6-D, a new series, incorporates a number of refinements in the engine, largely from the standpoint of more efficient handling of the fuel and better lubrication. The structural parts of the chassis remain the same, and the bodies have been altered only in detail.

The Nelson vaporizer takes the place of the former water jacketed intake. As shown in the sectional view of the engine, part of the exhaust is carried across the cylinder block through a steel tube contained in a cored passage in the block between cylinders 3 and 4. The gases are conducted by this pipe to the exhaust jacket of the vaporizer, which is located in an elbow in the intake just before the gases enter the cylinder head. The exhaust gases are permitted to flow around the ribbed vaporizing stove in this elbow, and pass back through a separate line to the exhaust pipe, entering it at a point just ahead of the muffler.

The exhaust pipe section has been reduced sufficiently to make up for the additional exhaust passage through the vaporizer. This results in sufficient back pressure in the main exhaust passage to cause a flow of exhaust gases around the vaporizer. Owing to the elbow form of the vaporizer, the heavier particles of fuel are thrown against the outer circumference of the stove, while any of the fuel which is creeping along the walls of the inner radius comes in contact with the stove also. As the corrugations extend entirely around the jacketed elbow, no portion of the intake wall is unheated, which prevents any possibility

of seepage of raw gasoline along the walls of the intake.

A new piston, also a Nelson patent, is now used, which has made possible an increase in the compression ratio from  $4\frac{1}{4}$  to  $4\frac{3}{8}$ . This has resulted in a higher mean effective pressure and, consequently, greater output and greater economy. The Nelson piston, which is also shown in the section of the engine, is an aluminum alloy type which is expanded to an oval shape while cool. The piston is machined from .010 to .012 in. undersize and then is expanded at right angles to the wrist-pin by the bar or strut shown in the section. It is expanded in this way to 0.002 to 0.00215 in. clearance in the plane of this expander. The theory of the piston is that this expander puts the initial expansion in the piston, so that under heat no further expansion takes place in the plane of the expander. In other words, as the piston becomes warm it goes to a round shape and more completely fills the bore of the cylinder.

A detail refinement in the construction of the cylinder head is the incorporation of a slot in the metal just below the spark plug, so as to bring the cooling water closer to the plug. The increased compression has induced a change in the valve timing. The exhaust is now closed and the inlet opened 4 deg. after top center; the inlet closed 60 deg. after bottom center, in place of 45 deg., and the exhaust opened 52 deg. before bottom center, in place of 45 deg. This timing provides for higher speed of the engine.

Sectional assembly of Premier engine, showing new vaporizer at A, which is fed by steel pipe B, from exhaust manifold C. Also new Nelson piston with expander shown at D

Premier transmission cover containing the interlock mechanism and gearshift lock which locks the transmission in neutral

On the new series there is no groove in the connecting rod bearing, while in the main bearing there is a single circumferential groove all around for continuous oil feed. In the previous series, the connecting rod bearings were grooved, and a different system of grooving was used in the main bearing.

Flanges have been put on the connecting rod bearing bushings so as to provide stiffness and render them independent of the connecting rod bearing caps in this respect. The function of the bearing cap is now only to hold and not to stiffen the bearing. The bearing has been so arranged that the shims are now flush with the edges of the bearing, and, consequently, there is no oil scraping edge at the point where the bearing cap joins the bearing. Another improvement in the oiling system is the increase in size of the oil suction line from 5/16 to 3/8 in. Oil leakage has been further guarded against by placing gaskets under the cap over the valve action. Ten instead of four splines are now used in the Borg & Beck 10 in. clutch. The Cutler-Hammer electric gearshift has been replaced by a hand shift, the electric gearshift being now listed as

special equipment at an extra cost of \$200. The new cover incorporates a shifter lock and also has the interlock integral with it, so that the new head can be assembled to the old transmission case. The construction employed is shown in one of the accompanying cuts.

Spicer universal joints are now employed. The rear axles are a new Timken design. The chassis is lubricated by the Alemite system. There have also been one or two refinements in the fuel system, such as an increase in size of the D-shaped vacuum tank and the substitution of a 1 1/2 for a 1 1/4 in. carburetor.

The body lines have been improved, the enclosed cars now all having a sloping front. The instrument layout has been changed for the sake of better appearance; the curtains in the open cars are now carried in the front doors, and the top is lined. Putting the curtains in the front doors has necessitated placing the tools in another location, and they are now under the front seat. In changing the dash layout, the clock and speedometer have been combined and two instrument board lights are provided instead of one.

## Special Alloys in Exhaust Valve Construction

**I**N the recent description of the Wills Sainte Claire car which appeared in the November 10 issue of *AUTOMOTIVE INDUSTRIES*, it will be remembered that mention was made of a special exhaust valve construction. The various parts of these valves are made of different materials, depending upon the function each part has to perform. The stem and head are made of invar, a nickel alloy steel, while the valve rim is of another alloy steel having high heat-resisting qualities. The tip of the valve, which is subject to the continuous contact of the valve follower, is of chrome-cobalt steel.

The possibilities of welded valves are of interest to automotive engineers and have been made the subject of considerable investigation. Not long ago the Rich Tool Co. submitted a welded valve to the power plant section of the Air Service at McCook Field for tests. The results of these tests showed that this type of valve is likely to be very satisfactory, even under the exacting requirements of air service. The valve is a high chrome-tungsten steel with a seat of heat-resister material welded to it. According to the Rich company the seat material is composed largely of cobalt and chromium, and the alloy is said to possess non-staining and non-oxidizing properties to a high degree.

So far the tests have not included long service runs, but have been more or less of a laboratory nature. Satisfactory results are expected from the former tests, however, according to the material section at McCook Field. The bond between the body of the valve and the material in the seat is said to be very good and should withstand severe service conditions. On tests it was found that the welded-on seat material is resistant in large measure to attack by 20 per cent aqueous sulphuric acid. When the valve was subjected to a highly oxidizing flame at a temperature of about 1350 deg. Fahr., the chrome-tungsten steel of the valve proper scaled perceptibly, but the welded-on seat showed only slight oxidation.

As a result of microphotographic investigation, the weld is shown to be clean, with ample evidence of the alloying of the cobalt-chromium seat with the chromium-tungsten valve steel. The structure at the weld is shown in Fig. 1. The spine-shaped carbide particles on the steel side of the weld are at grain boundaries shown in Fig. 2. These particles are characteristic of an area

which extends back into the steel for about 1/16 in., and they find no counterpart in the deeper general structure of the valve steel. This can be taken to indicate that the depth of the alloy of cobalt and chromium with the steel is equal to about this distance.

(Left)—Structure at weld of valve seat showing the cobalt-chromium alloy on left side and the steel on right  
(Right)—Structure of steel adjacent to weld. Note the spine-shaped carbide envelope. This area probably represents an alloy of the cobalt-chromium with the steel

## Official Motor-Coach Body Revisions in Britain

**T**HE rapid and large development of road auto coaches for 16 and more passengers lends importance to the rumor of a coming revision of the permissible dimension of the bodies for these vehicles. It is anticipated that the Ministry of Transport will order that the overall length must not exceed 25 ft. and the wheelbase 16 ft. (excepting for special vehicles to be considered apart) and the overall body, including overhanging hoods width will be limited to 7 1/2 ft. The gasoline tank will have to be under the rear of the chassis, and all must be equipped with easy get-at-able fire extinguishers and must have fully opening doors.

**I**NCREASED financial aid from the government will be given civil aviation in Switzerland. This will include the assistance of the government in the establishment of an air mail line next year to connect with international services. Provision is made for grants in aid to enable civil aviation concerns to buy modern transport machines.

# Multiplicity of Models Feature British Motorcycle Show

Tendency toward simpler frames, use of pressed steel, ball and roller bearings in engine, and all-chain drive are noted. Overhead valves are gaining in popularity. Many two-stroke engines, some with two cylinders, are employed. Prices are lower than last year but still above pre-war standard.

By M. W. Bourdon

IT need hardly be said that considerable reductions in prices as compared with last year were general at the recent Motorcycle Show at Olympia. On an average these reductions approximate 25 per cent, and prices range from £21 for a 1½-hp. two-stroke single-speed belt-driven lightweight machine to £150 for the most expensive of the 8-hp. two-cylinder machines with four-stroke engines. In the case of the latter type, standard sidecar outfits still leave little remaining out of £200.

One outstanding feature of the show was the large number of new models supplementing existing types. As in the case of British car makers, so with the motorcycle firms; the endeavor which was apparent here and there immediately after the war to specialize upon one model only has been dropped and the pre-war policy of offering a multiplicity of models has been reverted to. Four distinct models is quite normal; five and six is not remarkable; and in one case the range comprises twelve distinct models.

This policy of returning to a big range of types is the result of the trade depression during the past year; makers who were specializing in small machines are endeavoring to cut into the trade in larger sizes, while those who have hitherto specialized in 6-hp. and 8-hp. machines are trying to supplement their output with lightweights.

The further development of the lightweight movement was another feature of the show, and whereas last year users who bought the increasingly popular 2½-2¾-hp. type of machine and fitted a sidecar to it, did so at their own risk, now a score of makers offer this type with a strengthened frame and minor variations for sidecar work. The majority of these lightweight combinations have four-stroke single-cylinder engines, but quite a number have a two-stroke engine rated at 2½-hp., a type which showed up extremely well in the Auto Cycle Union Six Days' Trials last August.

The endeavor to boom motor scooters two years ago has not been entirely given up, three or four firms at Olympia having this type of machine on view; but it has not by any means attained the popularity that was expected, and the total output has been very small compared with anticipations. But the scooter has developed in other directions into an ultra lightweight motorcycle with a 1½-hp. engine in a glorified pedal cycle with spring forks, lower frame and pedaling gear. As a rule, it is supplied with a single gear with belt drive; occasionally it is seen with a two-speed gearset and chain and belt transmission.

A great many of the new models at the show were of what is known as the "sports" type, or, as Triumph—the maker with the biggest motorcycle output in Great Britain—terms this model, "fast roadster." It is usually much

the same as the standard roadster solo machine, but has almost flat and wide handle bars, footrests instead of footboards, exhaust pipes without a muffler, narrower mudguards and a lower frame. In one or two instances, the engine is of a special high efficiency type, but these cases are exceptional.

Overhead valves show distinct signs of increasing popularity, especially for the "sports" models just referred to, though this tendency is by no means only in that direction.

The pressed steel frame is unusual in British motorcycle practice, for there are very few examples of this form of frame construction. Nevertheless pressed steel is being more widely used in certain parts of framework. For example, it occurs here and there in the formation of a tank which displaces the top tube, combining the two functions. The Beardmore precision machine first exemplified this arrangement, and the practice of using pressed sheets for mudguards, combining the back one with a carrier and toolbox, is being continued on additional models of this and one or two other makes. The back stays are also formed of pressed steel in two cases, but, taken generally, frame design remains where it was in the vast majority of machines. The duplex type of tubular frame is, however, more frequently observable; in one machine (the Dot) the bottom part of the frame is some 16 in. wide and has tubular cross members which support the engine and gearset. A development of this will certainly be the enclosing of the engine and transmission by side panels, a feature which is to be seen in isolated cases already.

A notable development indirectly connected with frame design is the rapidly increasing popularity of what is termed the saddle tank, this consisting of a bifurcated unit which is dropped over the upper top tube of the frame and reaches just below the lower top tube (where the latter is used), thus giving the machine the appearance of having a tank displacing top tubing. The appearance is certainly improved by this arrangement. The tank is more or less cylindrical and streamline in form, for the bifurcation is not usually evident except at fairly close quarters. A branched outlet for the fuel is provided, with two taps, the well on one side forming a reserve tank.

Another move in the same direction is to use a streamline tank below the top tube with a depression along the top in which the frame tube is more or less hidden. Both of these systems have a more practical appearance, making the machine appear less "scrappy" than when a square section or straight-sided tank is used.

Still referring to frames, welded joints in place of brazed tubes and lugs are gradually becoming more popular, but they still appear only on a small minority of models.

1—Valve gear of Martinsyde engine; has overhead exhausts, and inlets operated by rocking levers. Upper view shows exhaust valve cage detached. 2—Aluminum "fir cone" radiators forming valve caps of new J. A. P. engines. 3—Crankcase breather on new J. A. P. engines ejects oil mist on to valve stems. 4—Popular type (Brampton) of sprung front fork providing both parallel and pivotal movement. 5—Peters spring fork design. Head tube encloses leaf spring attached to pivoted fork. 6—Example of duplex frame; the Dot, which has buffer springs for hinged rear half. Note inverted semi-elliptic saddle springs. Engine and gearset supported by transverse bottom tubes. 7—Simple adaptation of leaf springs to provide flexible rear frame—the Coulson. 8—Composite tubular and pressed steel frame with rear portion sprung on Hagg tandem. Rear seat is carried on pressed steel back mudguard. 9—Peters frame and engine, with detail view of cylinder and tank connection. Rear stays form muffler and duplex exhaust outlet. 10—Example of "saddle" tank. Inset is section in mid length looking rearward, showing location of frame tubes. 11—Streamline tank serving as frame brace, adopted by several makers

12—Pressed steel sidecar chassis with flexible couplings to cycle. 13—Typical sidecar with dickey seat for child. 14—Single seated sidecar convertible to tandem for two adults, as shown in lower view. 15—Simple contracting front wheel brake on three-wheel T. B. runabout. When band brakes are not objected to, the principle might well be applied to car. Actuation is by Bowden cable

Approximately 50 per cent of machines have engines made by the motorcycle manufacturer. On the remainder, the majority have the J.A.P. engines when a four-stroke type is used and the Villiers as a two-stroke. The J.A.P. engines are made in a big range of single and two-cylinder models, all four-strokes, and with an L-head cylinder arrangement. The two-stroke Villiers, on the other hand, is made in one model only, which has a flywheel magneto. It is termed  $2\frac{1}{2}$ -hp. with a bore and stroke of 70 x 70 mm. At the show a development was introduced in this engine. The flywheel magneto was accompanied by a lighting generator.

Apart from proprietary engines, the two-stroke is increasing in numbers, but decreasing in size, and more two-cylinder two-strokes are now on the market. The smallest two-stroke on motor bicycles proper, as distinct from scooters, is  $1\frac{1}{2}$ -hp.; the largest is now a 5-hp. 45-deg. V two-cylinder with a bore and stroke of 70 x 70 mm. The largest single-cylinder two-stroke, the Dunelt, is a 4-hp. engine (85 x 88 mm.), which has an annular space at the bottom of the working cylinder in which reciprocates a lower extension of the piston with an enlarged diameter to form a pumping cylinder. But, generally speaking, the machines above  $2\frac{1}{2}$ -hp. have four-stroke engines.

The increasing use of overhead valves has been mentioned, and the two British makers with the biggest output of motorcycles—Triumph and Douglas—have both adopted overhead valves in one or more of their models. Triumph confines this valve arrangement to the sports or "fast roadster" type, which has a single-cylinder Ricardo-designed engine with two inlet and two exhaust valves in the detachable head operated by exposed push-rods and dual rockers, a feature of the latter being that they are supported in ball bearings. This engine is termed  $3\frac{1}{2}$ -hp., having a bore and stroke of 81 x 87 mm. The inlet valves are of the "masked" type, the seatings of the

valves being countersunk into the surrounding surface of the cylinder head, in conjunction with a cam giving an additional period of lift at each end to compensate for what would otherwise be, in effect, a reduced period of valve opening. For this arrangement the advantage of a steep-sided cam is claimed, although the longer cam actually commences to open and closes finally quite gradually; consequently it is said that high efficiency is obtained with quiet valve gear.

The Douglas overhead valve engines are, like the remainder of the Douglas line, horizontal twin cylinder motors. The valve rockers in this case are enclosed within aluminum casings extending fore and aft beyond the detachable cylinder heads, the crankshaft being transversely arranged. One maker, Martinsyde—also responsible for the Martinsyde airplanes—has side inlet valves and overhead exhaust valves, reversing an arrangement seen in a few other engines, namely, side exhaust and overhead inlet.

In two of the J.A.P. engines with side valves, the sparking plug position has been altered so that the plug projects from the side of the valve pocket, and the valve caps consist of "fir cone" radiators of aluminum, the object being, obviously, to eliminate the hot spots usually occurring at the valve caps. This scheme is illustrated in one of the accompanying sketches.

The Bradshaw system of oil-cooling has not yet been adopted by any other maker beyond the firm responsible for the Zenith machines; but developments in this connection are to be expected, for a range of engines on this principle is to be made available for motorcycle manufacturers generally. In this engine design, it may be recalled, only the finned cylinder heads project from an enlarged crankcase, the cylinder barrels being exposed within the latter, where they and the pistons are cooled by the large quantity of oil circulated by a gear type pump. In the L head pattern the valve stem, spring,

guides and bottoms of the valve seatings are also exposed to the oil, which itself is cooled by radiation through the large area of the aluminum crankcase.

Motor attachments for pedal cycles have not taken hold of the public, and they are rarely seen except at Olympia. At the recent show there were two firms showing attachments of this type, one of the outfits exhibited also being applied to an invalid chair.

### The Ignition Systems

Magneto ignition still remains universal, a separate unit being general for four-stroke engines, though, as mentioned, the most popular two-stroke—the Villiers—has a flywheel ignition generator, and this scheme is also in evidence on one or two other comparatively unknown makes. Where electric lighting is fitted (invariably, by the way, as an extra), the generator is usually combined with the magneto. The three most popular outfits are the M-L, Lucas and B.T.H. In the M-L arrangement there is only one rotating unit operating within pole pieces of peculiar shape in conjunction with a stationary coil for the lighting circuit. It is truly a combined magneto and lighting generator, and yet the lighting and ignition circuits are entirely distinct. In the Lucas, on the other hand, there are two armatures, one for ignition and one for lighting current, that for the latter passing through the horseshoe magnets above the other, the armatures being intergeared. The B.T.H. system is known as the Spark-light, the current being drawn from the ignition armature during approximately 40 deg. of the latter's rotation, that is, during a part of the period when the armature is not called upon to supply current for ignition. A continuous, as distinct from an alternating current, is generated to charge a small cell, the commutator gear for the lighting current being an attachment to the standard contact breaker plate and designed for fitting to any of the B.T.H. magneto range.

Two-lever carbureters, inferring hand adjustment of the air as well as of the throttle, are used on the majority of machines, and the single-lever type does not appear to have gained in popularity among either manufacturers or users.

Aluminum pistons show a slight gain and also floating wrist pins, but cast iron in the one case and wrist pins secured to the piston bosses in the other still remain predominant. A distinct development is evident, however, in respect of engine bearings. Ball bearings for the crankshaft journals and roller bearings for the big-ends are becoming increasingly popular; even the makers of the J.A.P. engines, who have hitherto held out against ball and roller bearings, have adopted them on new models.

### Lubrication Systems Show Little Change

There is no outstanding change to record in methods of lubrication, the splash system being used on approximately 96 per cent of engines, though methods vary considerably in the system of introducing oil to the crankcase. A mechanical pump for this purpose is used in the majority of the largest engine sizes, the pump working at one-sixtieth engine speed. It draws oil from the frame tank, pumps it to a sight feed, whence the lubricant runs by gravity into the crankcase interior. Semi-automatic systems are most prevalent in single-cylinder engines of the four-stroke type, the normal drip feed having to be occasionally supplemented by charges driven with a hand operated pump.

In two-strokes the "petrol" system (in which a proportion of lubricating oil is mixed with the gasoline) is rapidly being superseded by alternatives, the latter usually taking the form of a drip feed from a sight glass, the oil passing through a branched pipe to the cylinder wall and

16—Reynolds tandem, has 3½ hp. single cylinder engine under front seat. Transmission by chain through three-speed gearset. 17—Chassis of Ner-a-Car machine, which has pressed steel frame, friction variable gear and 2½ hp. two-stroke engine. 18—Typical featherweight machine, the 1½ hp. Hobart. Engine is of two-cycle type with direct belt-drive. Front forks have concealed springing. Sells at £21

to the crankcase; but in a few cases the drip supply is carried to the cylinder wall and to one of the crankshaft journals, thence through a drilled web to the crankpin, the other shaft bearing being of the ball or roller variety and without direct feed.

The unit construction of engine and gearset is exceptional. It is used only on two makes, and those with a small output by comparison with Triumph and Douglas and several others. The usual standard transmission is by primary roller chain from the crankshaft to the gearset and by V belt from the latter to the rear wheel. The all-chain drive is, however, becoming more popular with riders, and consequently few makers of machines of 3½-hp. and over fail to offer it at an extra cost. In only about 40 per cent of cases are the chains all-enclosed. In the remainder the secondary chain merely has a guard.

In the smaller sizes, more often than not, an all-belt drive is fitted to the standard machine, though a two or three-speed gearset with chain and belt drive is offered

at an extra cost. Variable pulleys with an all-belt drive have not yet disappeared; in fact, two of the dozen best known makers, Rudge and Zenith, continue to standardize this form of transmission on certain of their models.

Approximately 50 per cent of gearsets are supplied by specialists, the Sturmey Archer being by far the most popular in either two or three-speed types. This make of gearset has a single plate clutch with cork inserts for the two-speed box and the multiplate pattern for the three-speed. Kick starters are general but not universal, for in some cases they are offered as an extra. When the transmission is by all-chain, it is usual to embody some form of cushion or shock absorber in the drive, though in a few cases a special form of chain made by Brampton with spring links is adopted instead.

### Brakes

The horseshoe type of tire rim brake is gradually being superseded, mainly by a block operating in a special rim corresponding to a V-belt rim, the block applying to the

19—Underside of detachable cylinder head of four-valve Triumph, showing inlet valve open

inside of the V as a rule, though in a few instances the reverse is the case. The same type of brake, pedal-operated, is most usual on back wheels, either when the final drive is by belt or by chain; but expanding brakes within a drum attached to the rear hub are becoming far more usual, and they appear in a few instances on front wheels also. The external contracting band brake is only used in one or two cases, the internal type being preferred. Only on the most expensive and largest machines, and on merely a few of those, are the front and rear wheels quickly detachable and interchangeable with that on the sidecar.

Electric lighting is not standard on any make, though in 40 per cent of cases it can be supplied as an extra, the generator, as already mentioned, being almost invariably combined with the magneto.

### Passenger Vehicles

Probably 50 per cent of the motorcycles sold in England are sidecar combinations, ranging from 2½ to 8-hp. In the case of the larger machines, the passenger seat and its springing have become more elaborate and even luxurious each year. Sidecar wheels are often separately sprung, as well as the seat, one of the most favored arrangements including a pair of semi-elliptic springs, one of which is located each side of the wheel. Cee springs, quarter-elliptics, cantilevers and semi-elliptics are all used for seat suspension, quarter-elliptics at the front and a pair of Cee's at the back being the usual combination. In view of the general overloading of sidecars by additional passengers, two-seated bodies, usually in tan-

dem form, are frequently observed. At the show a number of makers exhibited this tandem type, and one or two showed "sociables," in which the sidecar passengers are side by side. Single-seaters convertible into tandem bodies were also to be seen in several quarters, and also single-seaters with a small dickey seat for a child. Failing the dickey seat, it is quite usual for the rear panel to bulge rearward appreciably and serve as the hinged top and rear door of a luggage compartment.

Sidecar chassis tend to become more complex than ever, and have usually four, if not five, points of attachment to the cycle frame. In one or two cases a three-point attachment is adopted with flexible couplings, which, with a limited range of movement, relieve both the sidecar and motorcycle frames of a large proportion of road shocks. Screens for sidecars are general, though charged as an extra, and folding tops appear on probably 20 per cent of combinations one meets on the road, though these, again, are not included in the catalog price.

Distinct from the sidecar combination, the three-wheeled cyclecar continues to hold a certain amount of favor. The Morgan is the most popular of this type of vehicle; it is made in several models—some air-cooled, some water-cooled. In all cases the engine is a two-cylinder V, driving through a clutch and propeller shaft to a pair of bevel gears on a countershaft. From this point the transmission is carried through one of a pair of chains leading to the single back wheel, the chains being brought into use by dog clutches on the countershaft.

### Three-Wheelers Elaborate

Some of the three-wheelers are, however, far more elaborate in their specifications, one even including a four-cylinder engine. They have water-cooled engines, and the transmission differs hardly at all from that of a four-wheeled car, in one case the final drive being by worm gearing. But obviously these more elaborate three-wheelers have little to commend them in competition with the small light cars with four wheels. In price, even, they show no advantage, and in this respect they have contemporaries in both directions—sidecars on the one side and light cars on the other. In the case of the Morgan already referred to, which has been a popular make since 1913, this competes directly in its simplest forms with sidecars, one model selling at £150 with an 8-hp. two-cylinder air-cooled engine.

As regards the Olympia Show generally, from a spectacular point of view, it excelled anything of the kind previously held. Ninety-five makes of motorcycles were shown, including 3 American (Reading, Harley and Indian), 1 Belgian and 1 French. The total number of machines on view was 440, and 27 three-wheeled cycle cars in addition. Including accessories and tires, and 45 pedal-cycle exhibits, there were 318 stands in all. As to business done, this was appreciably better than last year, but the revival was not so pronounced as in the case of the car show. Dealers were still very diffident in placing contracts, preferring to wait upon events and order "from hand to mouth," being encouraged in this policy by the announcements of practically all makers that immediate delivery of all models could be guaranteed.

The following summary of retail prices of solo machines will give an idea of the variations since the show of 1920:

	1920	1921
2½-hp. 2-stroke lightweights..	£55-£84	£36-£66
2¾-hp. 4-stroke lightweights..	80-120	52-100
3½-hp. single-cylinder .....	85-140	75-115
4½-hp. two-cylinders .....	120-160	100-120
6 -hp. two-cylinders .....	135-170	105-135
8 -hp. two-cylinders .....	130-180	118-150

# New Machine Grinds Wrist Pin Holes Simultaneously

Double spindle grinder obviates "bell-mouthing" effect and inaccuracy due to great overhang of spindle. Accurate alignment of two holes is assured by method of trueing wheels. Increased production is claimed.

By P. M. Heldt

**S**INCE the advent of the aluminum alloy piston there has been a tendency among engine designers to dispense with bushings in the piston bosses, causing the piston pin to bear directly on the metal of the piston. Several advantages of this practice are obvious. The cost of the bushings is eliminated; the weight of the reciprocating parts is reduced, and the bearing area can be materially increased. It may be that the increase in bearing surface obtainable will practically do away with the need for refitting the bearings during the life of the engine, but if not, looseness in the wrist pin bearings may be eliminated by regrinding the bearings and fitting new wrist pins. Quite lately a few makers of low priced cars seem to have extended this practice of using bearings in unbushed piston bosses to cast iron pistons.

When the bearings of the wrist pin are directly on the metal of the piston it is very desirable that the holes in the piston bosses be ground, so as to obtain at once a good bearing surface which does not require any running in. Grinding of these holes is a rather difficult operation. If the job is attempted with a single spindle grinder, the wheel spindle has to have a great deal of overhang and consequently cannot be made as rigid as would be desirable. Moreover, the wheel has to pass entirely through

one hole, and it has been found that when the wheel is nearly through and the pressure of the work is limited to a narrow width of its face, it will cut into the stock deeper and a "bell-mouthing" effect will result, which is very objectionable.

To overcome these difficulties the Bryant Chucking Grinder Co. has brought out a special double head grinder which grinds the two holes simultaneously. It is a development of the standard machine of the Bryant company. The piston is held in a special chuck mounted on a cylindrical fixture on the bed of the machine. A sectional view of the chuck and fixture is shown herewith. The chuck is mounted on the fixture on ball bearings and is rotated by means of a round belt from the countershaft. The piston is laid into a sort of Vee groove on the chuck, the sides of the groove being turned to conform to the outside diameter of the piston, there being two bearing arcs each about 30 deg. in extent. A clamp made of aluminum extends into the piston from the open end and presses against the inner side of the skirt at about the center of the areas of support on the chuck plate. The reason for the use of aluminum in the clamp is that this makes it easier to balance the chuck and piston. In the drawing the clamp is shown held in position by means of a stud and thumb nut, but this mechanism will be replaced by a cam device to get quicker action. The piston is quickly located in the chuck by means of a hand centering plug which accurately fits a central hole in the chuck and the bored hole in the piston boss. The cam to be used is of the face type, as sometimes used for transmission brakes. There are springs on the clamping studs, the object of which is to permit of a firm grip in spite of slight variations in the thickness of the piston wall.

In the grinding operation the two spindles move simultaneously in the same direction, but in order to remove the pistons the two grinding wheels must be moved apart to clear the clamping fixture. This is accomplished by means of a gear on the shaft of the pilot wheel, meshing simultaneously with a circular rack on the wheel slide and with a rack below it connecting through a rod extending through the center of the wheel slide with the movable slide on the other end of the machine. Thus when the pilot wheel is turned in one direction the two wheel heads are moved apart, and when it is turned in the opposite direction they are moved toward each other. As they approach the position of greatest proximity, the movable slide is clamped at both ends to the wheel slide, this clamping operation being effected automatically by a stop pin on the wheel slide coming up against the lever of the clamping screw at one end of the movable slide, this lever connecting by a link to the lever of the clamping screw at the other end. The stop pin on the wheel slide by

Fig. 1—Bryant No. 2 double head grinder, for grinding wrist pin holes in pistons

Fig. 2—Wheel heads swung back on cross feed extension for dressing wheels

Fig. 3—Work holding fixture showing method of clamping

means of which this clamping action is produced is adjustable.

For the cross feed the same swinging bar is used as in the regular Bryant grinder. The wheel heads are balanced by two counterweights which are adjustable with respect to the axis around which the wheel heads swing. The counter movement of the two wheel slides is effected by hand, but the traverse during the grinding operation is by power, the change over from hand to power control being made by means of one of the levers in front of the machine. The motion of the wheel slides in grinding is reversed automatically by means of two clutches and reversing stops.

In order to prevent "bell-mouthing" of the ground holes, the wheels are passed only half way through. Concentricity of the holes in the two piston bosses is assured by the method used for trueing up the wheels. The trueing diamond is carried by an arm secured to the grinder bed at the rear directly in line with the work fixture. When the wheels are being trued the two wheel heads are clamped together, the same as in grinding, and the wheel slide is in the same position in its bearings as when grinding. The motion of the wheel slide for trueing of the wheels is governed by a control plate at the rear of the machine which slides on an extension of the cross feed screw. This extension of the cross feed screw is adjustable, but for any particular job it would be adjusted once for all. The control plate rides on the head of the cross feed screw in grinding and on the head of the extension bar in trueing the wheel. Hand feed is used for rough trueing and automatic feed for fine trueing.

In order to insure absolute parallel motion of the slide, a guide bar is arranged at the rear of the machine by which a lateral arm of the wheel slide is guided. There is a spring plunger in the wheel slide arm which insures that the contact between the wheel slide and the guide bar is always on the lower side.

Each of the two wheel spindles is driven by flat belt from the countershaft. Then there is a separate drive from the countershaft for the feed mechanism, by round belt, and a drive for the work holding chuck by another round belt. This latter drive is controlled automatically by means of a steel cable which winds around the cylindrical part of the wheel slide, so that when the wheel

head is moved out of the way to remove a piston, the chuck is automatically stopped from rotation.

In addition to the advantage of more accurate work as compared with that turned out by a single spindle grinder, for the reasons already explained, it is claimed

Fig. 4—Sectional view of work holding fixture with piston in place

for this new method of grinding out wrist pin holes that greater production results, because two holes are ground at the same time; the piston needs to be "plugged" or centered only once, and the semi-automatic feature of the machine facilitates the operation.

**T**ECHNOLOGIC Paper No. 186, entitled Oscillograph Measurements of the Instantaneous Values of Current and Voltage in the Battery Circuit of Automobiles, by George W. Vinal and C. L. Snyder, has been published by the Bureau of Standards. It contains the results of tests of the character indicated by the title, made on five different cars, as well as conclusions drawn therefrom. Copies may be had, for 10 cents, from Superintendent of Documents, Govt. Printing Office, Washington, D. C.

# Buenos Aires Show a Stimulation to Sales

Cars valued at 800,000 pesos sold directly at the exhibition which was featured by a large showing of passenger cars in the high priced class. Argentine body builders present many specially designed bodies suited to native tastes. More than one-half the exhibits were American cars.

Buenos Aires, Dec. 5.

COMING as it did in a year of business stagnation, with the Custom House full of rejected merchandise, including some hundreds of automobiles that are gradually being eased on to the market, the enterprise and forethought of the *Automovil Club Argentina* and the *Centro de Importadores de Automoviles y Anexos* in planning the fourth Buenos Aires Automobile Show was worthy of the success that crowned their combined efforts. The Show, under the auspices of the *Automovil Club Argentino*, was held in the *Pabellon de las Rosas* on the *Avenida Alvear*, near the *Palermo Gardens*, and lasted from the 12th to the 27th of November. In view of the depressed state of Argentine industry, the uncertain outlook for the future and the disastrous rise in exchange, it was eminently successful, in the indication it gave of the sources of immediate demand, as well as in the crowds who attended and the actual sale of cars. Perhaps the most significant feature of the show was the positive demonstration of the entrance of Argentine industry into the local automobile market in the building of specialized bodies to accord with the tastes of the wealthy Argentine.

Although trucks and tractors were well represented, the efforts of the organizers were chiefly directed toward the highly finished passenger car. They realized that business conditions prevented any great expansion in the sale of cars in the interior, and that the one point of attack where buying could be stimulated was among the wealthy classes of the city who can afford cars at any time. Consequently, fully half the makes represented were in the high priced class, while practically all the rest were what might be termed the medium price car. The representatives of low priced cars could be counted on the fingers of one hand.

## American Cars Predominate

There were in all 74 cars on exhibition of a total value of 1,200,000 pesos (paper), representing 38 makes. Of these slightly more than half were American, while the rest were scattered between England, France, Germany, Italy and Belgium. The models were mostly 1921 or 1922, though some 1920 models were exhibited.

One feature of the exhibit which was particularly striking was the strong showing made by the local body builders and designers. One-third, or 23 to be exact, of the cars shown had bodies that ranged from rich limousine and sedan designs to a special sport model for a Buick chassis that undoubtedly attracted more attention than any other single feature of the exhibition. Special de luxe bodies for Fords were also shown and favorably received.

Now this emphasis on special body designs and the success that attended it, as well as the abundance of high priced cars exhibited, indicates clearly the policy of the

promoters of the exhibition in appealing to the wealthy buying public of Buenos Aires for this year's sales. As each car was sold a neatly printed card was hung on the windshield of the model giving the name of the owner, thus stimulating the competition among the public to emulate their friends and acquaintances in purchasing new and expensive cars. The general success of the policy of pushing the higher priced models is indicated by the direct sales made at the show. When the results were fully tabulated it was found that 800,000 pesos (paper) worth of cars had been sold directly to the public.

## Should Stimulate Further Sales

These are the direct merchandising results of the exhibition. As to what the indirect results will be, it is too early to forecast an opinion. There are too many other outside factors which at the time of this writing are still undetermined. Certainly the local automobile importers are stimulated. Dealers from the country districts were present, and most of their interest was directed toward the lower priced cars. Whether the stimulation will extend to their market or not depends largely on the success or failure of the harvest that is soon to be gathered. If this proves good and it can be marketed at profitable prices, there will result both a quickening in demand and a lowering in exchange that ought to restore the market for automobiles for the interior to its former satisfactory condition.

There is undoubtedly a tremendous potential market in Argentina for automobiles, trucks, and tractors. As evidenced by the direction of emphasis in the Automobile Show, the one sure market under present unsettled conditions is among the wealthy public who spare no expense in order to have the very latest refinements both mechanically and artistically, in automobile construction. The market for cars in the low priced class has, in the past, been very strong. The present stagnation has hit the medium priced cars the hardest. That there will be a recovery is certain, but the exact time is contingent, as already stated, on the success of Argentina in marketing her products. The bad condition of the roads in the interior, which has been a deterrent in the past to the sale of automobiles, seems on its way toward a solution. Bills are pending in several of the provincial legislatures authorizing the construction of an extensive system of roads, and the Argentine public seems much more appreciative of the necessity of good roads to its future economic development. Next spring a Road Congress is to be held under the auspices of the Argentine Touring Club that has both official and private backing from the most influential sources. The popularization which it will undoubtedly give both to the advantages of good roads and of motor transportation ought to react strongly on the market for automobiles, trucks and tractors.

# Passenger Car Registration Fees Generally Low.

Proposed Uniform Vehicle Law would raise fees in most States for this type of vehicle. This would be desirable from the standpoint of the car manufacturer in that more money would be available for road maintenance and consequently more cars would be used. A few excessive fees.

**A**N analysis of state motor vehicle laws as they affect passenger cars reveals the fact that a great majority of the legislative bodies have failed to impose registration fees for this class of vehicle that are high enough to insure proper highway maintenance and a consequent increased use of motor cars.

This statement may seem rather surprising, coming as it does such a short time after the appearance of an article showing that the situation as regards motor trucks is quite the reverse in most states. The condition created apparently is one under which the motor truck owner is forced to bear more than his share of the taxation burdens, while the passenger car owner is let off with a slightly less amount than he should be charged. This is true, however, in only some states. In others the passenger car fees are considerably higher than those deemed fair, but even among these states there are few cases where the fees are high enough to deter the prospective car buyer from becoming a car owner. There is no case of an undisguised attempt to rule certain classes of passenger cars from the roads as was evident in many states when truck legislation was enacted. It is true that seventeen states have, within the past year, increased their registration fees for passenger cars with the result that some have required fees that are excessive and others have decided upon fees that are too low. These changes are shown in the table accompanying this article.

On the surface of things low fees would generally appear to be desirable, and so they are, but they should not be made so low as to prevent proper highway maintenance. This work should be paid for with money secured from automobile taxation and most car owners are, and should be, willing to bear their share of this expense. Good roads are an essential part of the proper functioning of a passenger car and have a direct bearing on sales.

Thus the passenger car industry faces two situations: one caused by excessive registration fees in a few states and the other by the reverse

being true in most states. Such a condition forcefully emphasizes the lack of uniformity that exists in motor vehicle laws. Those who studied the tables and charts presented in connection with the article on commercial cars will no doubt remember the highly diversified methods of determining registration fees and the great variance of fees in different states. It can readily be seen that the same condition prevails in the passenger car laws. There is the same diversity and variance, and while there is not as great a difference between the cost of registering a car in the state having the highest fee and the one having the lowest the difference is consider-

## Changes in State Laws Governing Passenger Cars

This table was prepared from data gathered by the Motor Vehicle Conference Committee.

State	Date new law is effective	Old Fees	New Fees	Old Speed Limits m.p.h.	New Speed Limits m.p.h.
Alabama	No new law	h. p. Fee Under 25.....\$15.00 25-29.....18.75 30-39.....26.25 40 or over.....30.00 Electrics.....20.00 Steam.....25.00	No change	30 m. p. h.	No change
Arizona	No new law	h. p. Fee 25 and less.....\$5.00 25 to 40.....10.00 Over 40.....15.00	No change	City.....10-15 Country.....30	No change
Arkansas	May 1, 1921	Flat rate.....\$10.00	Per h. p. ....\$0.25 plus 25c per 100 lbs. gr. wt. of vehicle and "vehicle load."		
California	No new law	Per h. p. ....\$0.40 Electrics (flat rate).....5.00	No change	City.....15 Country.....35	No change
Colorado	No new law	h. p. .... 20 or less.....\$2.50 21 to 40.....5.00 41 or more.....10.00	No change	General.....35 Mountain roads.....20 2% or more grade.....10 On curves.....18	No change
Connecticut	Jan. 1, 1922	Per h. p. ....\$0.50	8c per cubic inch or fraction thereof of piston displacement.	City.....30 Country.....20	No change
Delaware	No new law	Per 500 lbs. gr. wt. ....\$2.00 (Passengers at 125 lbs. each).	No change	City.....15 Country.....30	No change
Florida	Jan. 1, 1922	h. p. Fee 22 or less.....\$5.00 23 to 27.....8.00 28 to 35.....12.00 Over 36.....15.00	Per 100 lbs. gr. wt. of vehicle.....\$0.50	25	30 maximum. On bridges, turns, etc. 15. Passing street railway cars, 5.
Georgia	No new law	25 h. p. or less.....\$11.25 per h. p. over 25......60	No change	30	No change
Idaho	No new law	Wt. of vehicle lbs. 2,000 or less.....\$15.00 2,001 to 3,000.....20.00 3,001 to 4,000.....30.00 Over 4,000.....40.00	No change	City.....20 Country.....30	No change
Illinois	No new law	h. p. .... 25 and less.....\$8.00 26 to 35.....12.00 36 to 50.....20.00 Over 50.....25.00 Electrics.....12.00	No change	City.....10 to 20 Country.....30	No change

## Changes in State Laws Governing Passenger Cars.—(Continued).

State	Date new law is effective	Old Fees	New Fees	Old Speed Limits m.p.h.	New Speed Limits m.p.h.
Indiana	Jan. 1, 1922	h. p. Fees Less than 25 ..... \$5 25 to 40 ..... 8 40 to 50 ..... 15 50 or more ..... 20 Electrics ..... 5	h. p. Fees Less than 25 ..... \$5 25 to 40 ..... 8 40 to 50 ..... 20 50 or more ..... 30 Electrics ..... 5	City ..... 10 to 15 Country ..... 25	No change
Iowa	No new law	Per 100 lbs. wt. \$0.40 plus 1% of value of vehicle (minimum \$10).	No change	30	No change
Kansas	July 1, 1921	Flat rate ..... \$5.00	Minimum ..... \$8.00 Plus 50c per 100 lbs. gr. wt. in excess of 2,000 lbs. Electrics, flat rate, \$10.00		
Kentucky	No new law	Per h. p. .... \$0.60	No change	City ..... 15 to 20 Country ..... 30	No change

Michigan	No new law	Per h. p. .... \$0.25 Per 100 lbs. unladen wt. .... 0.35 Electrics: Per h. p. .... 1.00 Per 100 lbs. wt. .... 0.35	No change	City ..... 15 Country ..... 35	No change
Minnesota	April 25, 1921	Flat rate ..... \$5.00	1.8% of mfrs. list price during first 3 years. 25% reduction 4th and 5th years. 50% subsequent years. Minimum for car weighing under 1 ton ..... \$12 over 1 ton ..... 15		
Mississippi	No new law	Per h. p. .... \$0.50 (Minimum, \$5.00) Electrics ..... 15.00	No change	City ..... 15 Country ..... 30	No change
Missouri	No new law	h. p. Fee 2 or less ..... \$2.00 2 to 11 ..... 4.00 12 to 23 ..... 6.00 24 to 35 ..... 10.00 36 to 47 ..... 14.00 48 to 59 ..... 18.00 60 to 71 ..... 20.00 72 and over ..... 24.00	No change	25	No change
Montana	March 5, 1921	h. p. Fee 23 or less ..... \$5 23 to 37 ..... 10 over 37 ..... 15	h. p. Fee 23 or less ..... \$7.50 23 to 37 ..... 15.00 over 37 ..... 22.50 Electrics ..... 15.00	City ..... 15 Country ..... 25	No change
Nebraska	No new law	Wt. unladen, 1 ton ..... \$10 plus 50c per additional 100 lbs. (Minimum, \$10)	No change	Maximum ..... 35	No change
Nevada	No new law	Per 100 lbs. factory weight plus weight of passengers at 125 lbs. each ..... \$0.35	No change	Reasonable and proper.	No change
New Hampshire	Jan. 1, 1921	h. p. Fee 15 and less ..... \$10 16 to 30 ..... 15 31 to 40 ..... 20 41 to 50 ..... 25 51 to 60 ..... 30 over 60 ..... 40	60c per 100 lbs. weight of vehicle and rated load capacity.		
New Jersey	Jan. 1, 1922	h. p. Fee 10 or less ..... \$4.50 11 to 29 ..... 7.50 30 or over ..... 15.00	40c per h.p. up to 29 h.p. 50c per h.p. for 30 h.p. or more.	City ..... 12 Country ..... 30	No change
New Mexico	Jan. 1, 1922	Per h. p. .... \$0.40	Per h. p. .... \$0.40 Electrics ..... 12.00	Reasonable and proper.	Country ..... 30 20 in passing, 8 crossing railroad tracks. City ..... 15
New York	No new law	Per h. p. .... \$0.25 Subsequent Fees Yrs. after Mfg. date of list price 3 ..... \$0.40 4 to 5 ..... 20 over 5 ..... 10 Minimum 4 cyl. .... 5.00 5 cyl. or more ..... 10.00	No change	30	No change

able. This is especially true in cars of the higher price class. These differences are clearly shown in the following table which gives the high and low points reached for cars in five different price classes:

Price Class	High	Low
\$400 .....	\$22	\$5
\$1,000 .....	28	5
\$1,600 .....	40	5
\$2,000 .....	47	5
\$4,000 .....	72	5

These figures would, of course, vary on different cars within each price class, but typical cars have been taken from each of the five groups and the fees computed for them in each state on the basis of existing laws. These typical cars have also been used in determining the fees shown in the table that follows this article. It can be seen from these figures that there is the same lack of uniformity that existed in the truck fees.

Another feature running parallel with an outstanding one in connection with the truck laws is the various methods of determining fees. Nine different methods are in use at present, and while one may be as fair and equitable as the other, the variance is there nevertheless. These methods, with the number of states having each in use are shown in the following table:

Horsepower .....	25
Weight .....	11
Horsepower and weight combined ....	4
Percentage of original cost .....	2
Flat rate .....	2
Weight and percentage of cost .....	2
Horsepower, length of service and number of cylinders .....	1
Per cu. in. piston displacement .....	1
Weight, horsepower, percentage of cost and length of service .....	1

It can thus be seen that about every combination conceivable has been used in securing a basis for determining registration fees. The result has been indicated. Minnesota charges \$72 for registering a car in the highest price class, while not many miles away the same car can be registered in Colorado for \$5. These are extremes, of course, but they serve to illustrate the point.

This condition is not a new one. It has long been felt and some time ago a special committee which was composed of representatives from the American Association of State Highway Officials, National Automobile Chamber of Commerce, American Automobile Association and Highway Industries Association met and drafted the Proposed Uniform Vehicle Law, which if put in effect would equalize fees and restrictions all over the country. The fees imposed by this law would be based

upon the following principle:

Per horsepower .....\$0.25  
Per 100 lb. gross weight ..... .25

Were this law in effect the registration costs for a typical car in each of the five price classes would be as follows:

\$400 .....\$11  
\$1,000 ..... 15  
\$1,600 ..... 16  
\$2,000 ..... 18  
\$4,000 ..... 20

Under present conditions there are 13 states charging more for registering a car in the \$400 class than would be charged under the proposed law; 3 states charge the amount proposed and 32 states charge less than the uniform law fee. In the next price class 8 states charge more, 3 charge the amount proposed and 37 charge less; for \$1,600 cars 13 states charge more, 5 charge the amount proposed and 30 charge less. For the typical \$2,000 car 13 states charge more, 4 charge the amount proposed and 31 charge less; in the highest price class 14 charge more, 3 charge the amount proposed and 31 charge less.

In passing it may be interesting to note that 8 states charge less for registering a car in the highest price class than would be charged for one in the lowest group were the law in effect; conversely, 1 State charges more for registering a car in the lowest group than would be charged for one in the highest under the Proposed Uniform Vehicle Law.

There is also a considerable variance in some states as to the fees charged for the different types of cars. Minnesota again offers the best example of this, for in that State the fee for the highest priced class is \$72 and for the lowest \$12. It is hardly likely that the difference in the wear and tear on the highways between these two classes of cars is enough to justify such a difference in registration costs. It is quite probable that the man who buys an expensive car can as well afford to pay \$72 as the man who buys a lower priced one can afford to pay \$12. Such fees as the former ones, however, only add strength to the convictions of those who still maintain that the automobile is a luxury, and declare, "It isn't the original cost; it's the upkeep." There is bound to be a certain feeling of injustice when the man who buys an automobile has to pay \$72 to the State for the privilege of running it. Such a fee, however, is unusually high, for the next highest fee for such a car is \$56 and from there the decline is gradual until it reaches

the low point of \$5 in Colorado, where the flat rate system is in effect.

The increases that have gone into effect in the past year have ranged from 1 to 440 per cent for a car in the middle price class. The percentages in the other groups would vary, of course, but to no considerable extent. The following table shows the old fees, new fees and percentages of increase for a car in this group in the seventeen states which have enacted new laws:

	Old	New	Percentage of Increase
Arkansas	\$10.00	\$11.00	1%
Connecticut	13.50	19.45	44%
Florida	8.00	15.00	87.5%
Indiana*	8.00	8.00	...
Kansas	5.00	13.00	160%
Maine**	10.00	9.35	...
Minnesota	5.00	27.00	440%
Montana	10.00	15.00	50%
New Hampshire	15.00	18.45	23%
New Jersey	7.50	10.94	46%
North Carolina	15.00	20.00	33 1/3%
Oregon	28.00	40.00	42%
Rhode Island	10.00	14.35	43.5%
South Dakota	6.00	18.00	200%
Utah	10.00	15.00	50%
West Virginia	4.50	19.45	332%
Wyoming	10.00	12.00	20%

\*No increase for the typical car in this price class.

\*\*A slight decrease for this price class.

From this table it can be seen that even among the states that have increased their registration fees there are ten that have not made the fees as high as they would be under the Proposed Uniform Vehicle Law. It is noteworthy, too, that many of the states increasing

the fees did not raise them as high as they are in other states that previously increased the registration charge.

Looking at the country as a whole it is generally believed that passenger car registration fees are too low. There are instances, of course, where the reverse is true. This serves to clearly show that the outstanding feature of the entire situation is the lack of uniformity. The Proposed Uniform Vehicle Law was set forth in the article dealing with motor trucks as a remedy to the situation, and it is outlined here as a remedy to the passenger car situation, both in the matter of reducing the fees where they are too high and of increasing them where they are too low to permit proper highway development.

It is quite probable that the adoption of the Proposed Uniform Vehicle Law for truck regulation in its entirety would be impractical in some states at the present time. Conditions of the highways and the money necessary to maintain them would be the most important factors entering into such a discussion, for there is no question but that heavy trucks play havoc with flimsy roadbeds. Such is not the case with passenger cars, however. The heaviest of this type of vehicle could scarcely be called destructive on the ordinary type of highway. It is for this reason that there can be found no sound reason for the lack of uniformity that exists. A comparison of the fees for passenger cars and trucks will show that in a few cases the fee for a 5-ton truck in some states is less than it is for a medium-priced passenger car in others. Certainly such a condition would not exist if careful thought and study as to the actual merits of the nation's automobile taxation system had been given.

## Siam Market for Cars and Trucks

DESPITE the increased use of automobiles in Siam the potential market there is not large, according to a report by James P. Davis, American consul at Bangkok. In all of Siam there are not 2000 motor vehicles, and while there will be more sold as time goes on the country is never apt to become one of importance so far as American exporters are concerned.

Poor roads, with chances for improvement small; lack of capital with which to buy cars; high cost of operation; Oriental dislike for new methods and other factors are the chief reasons automobiles are not to be found in large quantities in Siam. A few of the wealthy natives and Americans and Europeans are about the only prospective purchasers. Running conditions, however, are ideal, and cars that were bought in 1908 are still in operation, their owners seeing no real reason for buying new ones.

Bangkok at the present time is overstocked with cars, some 200 unsold cars being on hand, or almost as many as a year's importations. Sale of crops, however, is apt to cause the sale of some of these, but even after they are gone it is believed that many will be sent in from the Straits Settlements, Federated Malay States, India and China, as those countries are also overstocked with cars and they can be bought at low prices.

TESTS made in the mechanical engineering department of the Iowa State College, Ames, Iowa, with five different designs of muffler cutout on a four-cylinder 4 1/2 x 5 1/2 in. engine in a car, showed that the reduction in back pressure due to the use of a muffler cut-out at maximum engine speed and full throttle varied from 2 to 2.5 per cent of the total range of pressures in the cylinder engine, thus indicating that the loss in power and fuel economy due to the muffler are of this order of magnitude.

# 1922 Cornbelt Sales Limited, but Better Business Is Ahead

Farmers are holding corn for higher price with the result that money is scarce. Mr. Beecroft has just returned from making a personal survey of the area and analyzes here conditions as he found them.

By David Beecroft

THE cornbelt area, comprising the States of Iowa, central Illinois, northern Missouri, Nebraska and parts of other States in the Middle West, will come back into the motor car market just as soon as corn climbs from its present price of 28 cents to 40 or 50 cents a bushel. The automotive manufacturer need watch but one thermometer of business in that area—the price of corn. When that all-important product begins to bring prices that are a little less than half what they were a comparatively short time ago, the farmer will begin to unload his stock and he, as well as the town merchants, doctors and lawyers will have money with which to purchase automobiles. Then, and not until then, can the motor car dealer hope to find a market there with a capacity that will anything like equal the market in the past.

The cornbelt is literally stocked to overflowing with corn. Practically the entire crop of 1921 is on the farms, and in some areas 40 per cent of the 1920 crop is still in the hands of the farmer. There are farms where 1921 corn is piled in the open because the building storage capacity is filled with last year's crop.

The net result of such a situation is that the year 1922 will be even a poorer year from the standpoint of motor car sales than was 1921. The farmer was better off when the avalanche of falling agricultural prices first stampeded him. He had ready cash then, but to-day it is all gone and he is heavily in debt. He has not paid the town merchant, some farmers owing this important person from \$300 to \$500. The town doctor and lawyer are waiting patiently for their money and the car dealer is holding his notes. The farmer in the cornbelt has paid for very little that he purchased in 1921.

But the situation is far from being hopeless. As a matter of fact this period of depression is perhaps just what the cornbelt farmer needed. It is serving to bring him back to earth after a flight through undreamed of high prices and consequent luxuries. He was the prey for numerous vultures in the form of stock salesmen and promoters and is learning his lesson. Furthermore this valley in the curve of the automotive business is driving out those unstable firms that established themselves on a somewhat unstable foundation during the boom period. Those substantial automotive dealers who were in business before the war and who have conducted their businesses on a sound economic basis are still a considerable distance from the wall. The situation from their point of view is not particularly bright at the present, but they are fighting and fighting hard, and there is no doubt but what they will come out on top at the end.

An analysis of conditions affecting the cornbelt automotive market reveals the factors that have brought about the present situation. It also shows that the farmer to-day is a different citizen, mentally, than he was a year

ago. He no longer talks of \$1.35 corn, but his mind is on 50 cent corn. That looks big enough to-day and will satisfy him. The farmer has mentally adjusted himself to this new level of prices in the past year and is that much closer to liquidation. He is no longer asking for those conditions that prevailed during the war, but wants only conditions that will make him the substantial citizen he was before the war. That, of course, will be brought about and the sale of motor cars in the cornbelt will again reach a high point.

What brought about the present situation? A year ago the farmer went on a buyer's strike and continued on it most of the year. He has been firm in his refusal to buy. Not all have had money to buy, but many who might have been in the market have kept out of it. The buying capacity of not a few has been restricted by the inability of the country banks to loan money. These banks have tied themselves into a Gordian knot with the farmers and have no funds for loans. Farmers with 160 acres of good corn land worth \$200 an acre, and with a mortgage of but \$2,000 against it, have not been in the market due to lack of bank capital. They will buy on credit, but who can extend them credit? The motor car dealer, except in very isolated cases, cannot. Some country banks have not cashed a farmer's note in sixteen months. The country banks in the Sioux City, Iowa, radius owe the banks of that city \$6,500,000. These Sioux City banks are no different from those in Des Moines and other large population centers of the cornbelt area.

The country banks are largely responsible for their own condition. They got their feet tangled in the speculation period of 1917-1918-1919, when land jumped from \$200 to over \$500 per acre in many sections; when the wealthy agricultural sections were overrun with stock salesmen for a score of new ventures; when farmers went touring with their families to California or Florida in harvest time, leaving the farm with the hired help, and when many new luxuries in rural life were indulged in to the fullest extent. In those long-to-be-remembered days the farmer bought \$10,000 worth of stock in some new meat packing company, or other co-operative venture. He paid \$2,500 in cash and gave his note for \$7,500. The stock salesman took the note to the local banker and sold it at an attractive discount. These banks are still holding many of these documents, and will continue to hold them until the farmer decides to liquidate his corn and meet his obligations.

The banks are not closing on the farmers, for there is too much at stake. It is rumored that the bankers profited well on many of these flotations by the liberal discounts of the stock salesmen, and it is even further rumored that the stock salesmen got their lists of farmers capable of buying stock from many of these same rural bankers.

The bankers generally do not want to discuss the subject.

True, there is another aspect to this farmer-banker situation. The banker is not forcing the farmer to sell corn for fear that such a movement will result in too great a flow from the farmer to the market, which might result in knocking what bottom there is left out of the market. Instead of 28-cent corn the price might be 20 cents or even lower. This is good sound reasoning on the banker's part, and having, perhaps, made it easy for the farmer to get himself into his present financial straits, the banker is going to stay with him and get him out. There is nothing else left to do. In Iowa, for instance, where the State is 95 per cent agricultural, industry loses its grasp if the farmer goes into receivership. There is a general concerted movement to avoid this.

Like everyone else the motor car dealer in this section is hit hard. It is an impossibility for most of the farmers to pay their notes due to these dealers. Many are not even paying the interest as it comes due and yet few are foreclosing. Some are threatening to do so, but even they may decide otherwise. All classes are in pretty much the same boat. They went up together in war days and now they must stand together in days of deflation. The farmer is most in the public eye, and as all industries in the area are dependent upon him he must be saved at all costs.

So, as a result of this rise and fall of the farmer, the cities and towns of the area are affected in like manner. The merchants, doctors, lawyers—most everyone, in fact—are all out of the motor car market, and must remain out until the farmer pays them what he owes them. The farmer cannot come back until he has met his obligations to these people, consequently it might be reasonable to suppose that the first noticeable increase in sales in the area will be among the townspeople rather than on the farms. But that increase cannot be expected too soon. The picture is not a particularly pleasant one, but every cloud has a silver lining, and in this instance the lining is 50-cent corn. That is a possibility, and when it comes it will affect the cornbelt as 20-cent cotton has the Southern States in the last few months, although not quite to the same extent.

It is to the future, rather than to the present, that the automotive manufacturer must look in the cornbelt. Even after the 50-cent corn becomes a reality there must be time to bring about stabilization. The farmer must pay his debts and so must the men of the towns and cities. The year 1922 will not be a golden one so far as motor car sales are concerned, but all these conditions will gradually be removed and business will come back. The area has its face to the future. These days are man-making days. The cornbelt is suffering from a hard siege of recovering pains, but it is on the road to recovery, nevertheless.

The situation in Iowa is typical of what it is in the rest of the district. The statistics of that State are representative of other corn-growing States, and an analysis of conditions there will serve to show conditions of the cornbelt. The motor car dealers of that State are up against what they consider a pretty serious proposition, but they are not backing down. For a good many years the Iowa dealer was looked upon as something of a super dealer. Any State with a motor car for every 5.5 persons must have had some real motor car dealers. Iowa has

had real motor car dealers and still has some left, just as many real dealers as a year ago, but not so many unreal ones. A year ago the State had 4400 car dealers. Perhaps a majority of these were simply bowled off their feet and some of them have not gotten back on them yet. The Iowa dealers' lot was cast in pleasant places. He was not so great a salesman as the 5½-person-per-ratio would lead us to expect. The State had the money and bought cars. When the liquidation move hit the State many of these dealers had no real resistance to combat it or even stand up against it. They got a pretty severe solar plexus.

But Iowa, a year after this move of liquidation, still has a strong organization of motor car dealers, a group that will continue and will be on hand next year and the year following. Two hundred of the 4400 gathered recently in their two-day annual convention in Sioux City. The Iowa Motor Trades Bureau, which is the State dealers' association, had a membership of 1400 a year ago. To-day only 1000 are in good standing, and out of this 1000 only 200 registered at the convention. It was a small showing compared with 800 a year ago, but pretty

---

**C**ONSIDERED as a possible purchasing unit the cornbelt is not so attractive as a year ago. The farmer was better off when the avalanche of falling agricultural prices first stampeded him. He is on the way to liquidation, however, and the rising price of corn will materially affect the sale of automobiles in the corn-growing states. The boom is over, its results are being felt and the cornbelt will soon be on the road to recovery.

---

fairly represents the dealer situation in the cornbelt. Many sent regrets and openly stated they had not the ready cash and could not afford the trip. Many others are down and out, out of the sale of motor cars, perhaps for good. The mortality of Iowa dealers during 1921, however, has not been so great as might be imagined, for they are mostly running garages and doing a good repair business, but many have gone out of the car selling business. In one town of 2000

population in the eastern end of the State, there were eight car agents a year ago and only three to-day. The present three have garages in the town, but they have given up car agencies and declare they will not take on other lines. This percentage is fairly typical of how car lines have been dropped in all parts of the State. The newcomer dealer of two years ago, a product of war luxury, has been eliminated from the motor field, and while business failures are numerous they are from these ranks of newcomers, leaving old pre-war firms stable and pleasantly conspicuous. The cornbelt is sound. It is coming back.

The farmer has been out of the market this year. Ford dealers in such centers as Marshalltown, Waterloo, Cedar Rapids and Fort Dodge, who in years past sold 40 per cent of their cars to farmers, have sold 10 per cent this year, and in some sections not that many. In sections like the northeast corner, rolling Mississippi territory, where dairy farming is general, farmers have been good buyers, and have paid cash. Some dealers selling high-priced cars have sold three or four to the farmers where they formerly sold 50 or more. Motor truck sales to farmers have almost stopped. One Ford dealer who sold thirty-seven last year has sold ten this year. Tractor sales ceased entirely. Dealers who sold fifty to seventy-five a year ago have not sold one. Many tractors sold in the last two years have not been used. The farmer has worked his horses and saved gasoline. It has been a poor year for the sale of accessories. The biggest jobbers admit business has been from 40 to 50 per cent of what it was last year. To-day the accessory shelves of the dealers are empty or nearly so. The recent "Ask 'Em to Buy" campaign of the Automotive Equipment Association, how-

ever, has electrified the accessory business and awakened the garagemen to the realization that there is still some ready money in Iowa. One Des Moines dealer told of monthly accessory sales on his service floor, of \$3,200, by the foreman on the floor. The "Ask 'Em to Buy" campaign was a big stimulant. The dealer who does not expect to sell many vehicles in 1922 is going after the sale of accessories and repair business with hammer and tongs. The jobbers are co-operating in the effort. One of the biggest Iowa jobbers is putting double the number of road men on for 1922 that he had in 1921. He is putting them on a commission basis instead of straight salary and expects to double the business of this year.

The jobbing trade of Iowa did not escape war expansion. Two years ago there were eighteen jobbers in the State. To-day there are eight, or approximately the same number as in pre-war days. The newcomers have disappeared.

The automotive dealer has a full realization that even in the cornbelt the motor vehicle has not reached its point of saturation, and that the only saturation point of motor vehicles is the saturation point of transportation. The section has its own problems, but statistics indicate the possibility of automotive sales in many lines. Of a population of 2,500,000 in Iowa, 63 per cent live on the farms, of which there are 204,000. The Iowa farmer to-day owns 171,575 acres, according to the Government census, which means that there still are 32,000 Iowa farmers to be sold cars. Statistics do not tell what part of the 24 per cent of the population of the State living in towns under 25,000 population own cars; or what percentage of the 13 per cent of the State population residing in cities over 25,000 own cars. All of these offer future fields for the alert dealer who is preparing as never before to sell to all three of these divisions of population.

#### The Motor Truck Market

As a motor truck market statistics are poor compared with those for motor cars. To-day one out of every eighteen farmers in Iowa owns a truck. The total motor trucks on farms are 10,788 for 204,000 farmers. When the revival sets in many farmers will purchase trucks before cars. The truck is a growing essential chiefly in view of the highway program which has been going on this year. The year 1921 has been the greatest record in the road building history in Iowa. Up to Dec. 1 this year 1406 miles of a 2502-mile primary road system was either completed or under construction. This primary system will connect market centers and county seats. The estimated cost of it is \$20,500,000. From Congress Iowa gets \$2,102,000 as her share of Federal aid for the

fiscal year ending June 1, 1922. Ninety-eight of the ninety-nine counties in the State have been working on this system. Following this primary system is a secondary one for connecting lines. The stimulant to the automotive market that such a highway system is to a State 95 per cent agricultural can scarcely be estimated, and the motor truck will take its place alongside of motor car when this system is well under way.

#### A Field for Tractors

The automotive dealer is not asleep to the possibilities of selling tractors in a corn and oat belt where land is worth \$200 to \$250 per acre, and where farms average 120 to 160 acres. Government statistics place the number of tractors in Iowa at 22,319, or one tractor for each ten farms. The remaining 182 farms are without tractors. The automotive dealer has played his part in selling the 22,319 tractors now in the State. One Iowa tractor manufacturer, the Hart-Parr Co., has 25 per cent of its dealers automotive dealers, and it is estimated that approximately 25 per cent of the dealers of the State sell tractors. Although tractors are literally stagnant at present the tone of the market is optimistic and 1923 is now being chalked up as a better tractor year. November of this year was one of the best farm machinery months of the year in Iowa. The farmer gave evidence of having to come into the machinery market. It is estimated that the farm machinery of the State is at 60 per cent normal to-day, which means that the farmer must start buying soon. The automotive dealer is grasping the broader vision of selling tractors. He no longer sells it as a mere substitute of animal power on the farm, but rather as a production machine for the farm.

The corn growing period is from May 15 to Oct. 3, the date of frosts. The tractor makes it possible to increase the yield per acre of corn by waiting until the ground is ready to plow in the spring and getting the seed sowed in time. It is also possible to plow the ground late in the fall in order to kill weeds and prepare the ground for spring. In these two ways the tractor takes care of the peak of farming. It is truly a production machine for the farmer. What is true of the cornbelt is also true of the winter wheat areas of Kansas, where July plowing is needed, and is also true of the wheat areas of the Northwest. It is in this aspect of handling the peak loads that the dealer sees in the tractor a rapidly increasing sales field and one that logically lies at his door.

The dealer has sold cars to a good high percentage of the farmers in the cornbelt, and he is now setting his house in order to sell to those farmers who do not own trucks or tractors.

## Kiln Drying Course for Home Study

SINCE the announcement of the correspondence-study course, Kiln Drying of Lumber, by the Extension Division of the University of Wisconsin less than two years ago, almost 400 persons have enrolled. This course has been developed through co-operation of the U. S. Forest Products Laboratory. Men from thirty-seven States of the Union and seven foreign countries have taken up this mail instruction to learn more about the art of operating dry kilns, and the proper handling of lumber in general.

This correspondence-study course is an outgrowth of the resident short courses which have proved so successful at the U. S. Forest Products Laboratory, located on the University campus. It was early recognized that much of the information on improved methods of kiln drying

could be taught by mail. Many men who cannot avail themselves of the class instruction in kiln drying given at regular intervals at Madison enroll for the correspondence-study course and so obtain valuable information upon the latest developments in the seasoning of wood.

The course consists of ten assignments, taking up the subjects from the structure of wood, its moisture content, shrinking and casehardening, on through a discussion of the various types of kilns, heat, humidity, circulation, and the operation of kilns. Drying schedules for all of the more common kinds of wood are included.

The text used in this course is specially prepared and in such a form that it can readily be understood by any one with only a common school education.

# South African Tractor Market Demands Study

## Part II

Mr. Bell, in this second article on selling tractors in South Africa, points out the necessity for using careful sales methods. The demand will not be large in the immediate future, but the territories there offer a great potential market and should be prepared for the expansion that will come.

By George B. Bell\*

**I**N creating a market for tractors in South Africa demonstrations play a very important part, and because of the sparsity of the population and the large distances to be covered, they present some difficulties. Care must be exercised not to "over-demonstrate," as some salesmen have done in the past by speeding up their engines or tampering with their governors. There have also been occasions when salesmen have attempted to haul a greater number of plows than their machines could handle, or to plow too deep. In such cases a poor impression is created upon those interested in the trials, while in the case of over-demonstrating, the buyer is either dissatisfied when he finds that the machine will not keep up to that mark in regular performance, or ruins the machine in attempting to keep up with the demonstration. These things are, of course, fatal to a successful marketing of tractors. The technically qualified expert does not fall into such errors of judgment and will not attempt trials except under favorable conditions, utilizing the model that is best adapted to the particular problem. Manufacturers who are only represented by dealers cannot lay too much stress upon educating their dealers into the policy of tractor service rather than a mere physical sale of machines.

It is also necessary that care be exercised not to give demonstrations except where sales are possible as, otherwise, large sums may be squandered in useless efforts. Before undertaking a demonstration, it should be understood that a purchase will be made if definite results are obtained, with the further understanding that the cost of the demonstration, or a part of it, will be borne by the farmer in the event of a decision not to purchase. There are many farmers who are eager to have free demonstrations, but dealers cannot afford to undertake free plowing on the off chance of making sales.

English tractors are the strongest competitors of American makes. They have the advantage of being admitted into the Union free of duty, as are also tractors from reciprocating Dominions, including Canada. The duty on tractors from other countries, including the United States, is 3 per cent ad valorem, which is based on the Home Consumption Value. Despite the fact that the price of the English tractor is not subject to an exchange handicap and is imported at a cheaper freight rate, the American article has dominated the field.

Several Fiat tractors have been imported, but their

unsuitability for the market and their higher price do not make them strong competitors at the present time. German competition is limited to the Hansa Lloyd tractor, which is imported through a Cape Town firm. Its quoted price is £750, which is about the equivalent of other makes of equal power and size. It is understood that the company selling these tractors in Cape Town will take in exchange South African merchandise at its market value. This competition apparently is not greatly to be feared as there is no service given with the tractor. In this connection it should be stated that American tractors have been shipped to this market perfectly packed, and the question of service and spare parts has been handled practically the same as in the domestic market. In general, in making a shipment of tractors, it is advisable to ship spare parts amounting to 15 per cent of the value of the tractors.

Tractors are handled by three classes of agencies—automobile distributors, agricultural implement and machinery dealers and engineering firms. Distribution by automobile dealers has been altogether unsatisfactory. This is due, in a large measure, to the fact that tractors have been sold merely as machines, without any special attention to the work to be performed, or the type of tractor needed. These firms, which are generally located in the larger cities, carry tractors simply as a side line, and consequently reach a very small part of the farming communities. Distribution through the well-established agricultural machinery houses has been successful, because these houses are intimately acquainted with the needs and methods of the South African farmers, and that they have branch offices and sub-agents in all parts of the Union. Engineering firms as distributors undeniably offer great possibilities, as they should be able to render great service in adapting tractors to the special uses for which they are intended. The average farmer is skeptical to-day as regards the advantage of the machine over oxen, and every failure serves to make it more difficult to market other tractors. It is natural that the farmer is incapable of making an analysis of the reasons for the failure and attributes it to tractors as a class and not to the particular tractor that has not made good. While it would be entirely possible for a manufacturer to educate either automobile distributors or agricultural implement dealers up to a strict regard for a sales policy based on an analysis of the requirements of each particular inquiry, it is admittedly more difficult than securing the co-operation of an engineering house with which such a policy is well understood.

\*Chief Agricultural Implements Division of the Bureau of Foreign and Domestic Commerce. Condensed from an article appearing in this week's issue of Commerce Reports.

It is not good business to try to force upon the distributor a greater number of machines than he believes he can sell to advantage in the first year or two. If the distributor has a well-formed sales organization and the tractor meets with the approval of his trade, he will quickly take advantage of such a situation and decide upon the quantities that he can handle to the best interests of both the manufacturer and himself. It is also best when a contract is made with a distributor that he be furnished gratis with the proper electrotypes, literature and repair lists, all bearing the name and address of the distributor.

Agencies may cover one or several of the natural divisions into which the Union is divided. Capetown, Port Elizabeth, East London, Durban, Johannesburg and Bloemfontein are the leading distribution centers, each serving the surrounding territory. Lourenco Marques is the principal center for Portuguese East Africa, while Salisbury and Bulawayo are the leading centers for Rhodesia.

Distributors purchase tractors outright from the manufacturers, generally being required by contract to maintain a stock of the various models, as well as an adequate supply of spare parts, in order to give good service. Purchases are made both direct from manufacturers and through American commission houses. A 90-day draft is generally drawn by the manufacturer and attached to the shipping documents if the purchase is made direct. Generally, and under normal conditions, if the distributor makes his American purchases through a commission house financial arrangements can be made that are satisfactory.

The credit of the large distributors is of the best, and a good risk. In normal times local sales are on a cash basis or else a large percentage of the purchase price is paid down. At present, when farmers are receiving low prices for their products, and when they are finding it difficult to meet their current liabilities, cash sales are infrequent, and terms must be given in order to turn over stocks, which, while not large, are more than sufficient to supply the present demand. Even when favorable terms are given it is frequently difficult to consummate a sale. Selling tractors at auction is quite common. A light-weight tractor has been sold, complete with plows and spare parts, as low as £100, and it is understood that a fairly large stock of this tractor is held in the Union.

Much improvement cannot be expected until the economic balance of the world is restored and South African farm products are moving steadily to England, Europe, Japan and the United States. However, one of the hopeful signs is that the continental, especially the German, demand is improving, and this will react favorably on the financial position of the farming community. As American tractor prices have been reduced in line with other products, local dealers holding stocks of machines imported at peak prices and low exchange rates have had to take fairly heavy losses.

The future demand for tractors cannot be measured by the present situation or that of 1920. The Union is making steady progress along agricultural lines, and the farmers are becoming more and more progressive. The potential market for the sale of tractors looms large,

and within the next five or ten years the pioneer work that is now being done should bring satisfactory results. There should be a decidedly increased use of the tractor not only in the Union, but also in Rhodesia, Portuguese East Africa, British East Africa, the Belgian Congo and the Southwest Protectorate, where the demand is very small or practically non-existent. No separate statistics are available for these sections, and it is therefore difficult to gage the present demand. American representatives state that comparatively few machines are used in Rhodesia and British East Africa, while there is practically no demand in the Belgian Congo and the Southwest Protectorate. Rhodesia should offer a good field in the course of the next few years, as ranching is carried out there on a large scale. The rich island of Mauritius, with its large sugar estates, is not a potential outlet, according to the representative of a large American company. This is due to the fact that the land is of a lava rock formation, necessitating hand cultivation. The cane is grown in rows between rocks, and even plowing with horses is out of the question. However, it is known that one estate is experimenting with two tractors, in spite of these handicaps.

The subject of advertising is not a complex one, although it is often mishandled. It would be advisable to utilize a qualified advertising agency either independently or in conjunction with an American agency. The names of several of these agencies are on file in the Agricultural Implements Division and will be furnished to those interested on request. There is certainly no necessity of giving the work to other than South African or American agencies.

The tractor trials recently held at Pretoria under the auspices of the Union Department of Agriculture at the Experimental Farm of the Faculty of Agriculture of the Transvaal University College served to emphasize the development of the tractor trade in South Africa. They were a result of the activities of the Tractor Dealers' Association, which realized the need for a more accurate knowledge of the possibilities of the tractor, and that records of costs, etc., based on European or American tests were wholly inapplicable to local conditions.

The trial consisted of plowing eight acres of virgin soil and six acres of old land, and of a brake test. Moldboard plows were used, the minimum depth of plowing required being 5 in. in virgin soil and 7 in. in old soil, although deeper plowing was permissible. There were the usual conditions regarding fuel, lubricants, oil, grease and water. White labor was reckoned at 12s. 6d. per day and colored at 2s. 6d. The purpose of the trials was to determine the efficiency of the tractors considered as plow tractors, and to find the cost of plowing per acre for various types of soils and under the conditions generally prevailing in the Transvaal, not, however, with a view to awarding prizes, but merely for the purpose of securing data and making observations regarding the work of each tractor.

There were three types of tractors entered—wheel tractors, tracklayers and motor plows. In the first class there were six American and two British machines; in the second class five American tractors, and in the third class there was one entrant, the Swedish Avance motor

---

**I**MPROVEMENT in the South African tractor market will not be great until the economic balance of the world is restored and South African farm products are moving steadily to England, Europe, Japan and the United States. Now, however, is the time for American manufacturers to pave the way for future sales in this market by systematic and intensive working of the field, so that they may be prepared for the development and expansion which may reasonably be expected.

---

plow, which has the motor and plows all on one frame.

Points to which special attention was paid were weight of machine and percentage on driving axles; weight per inch, width of wheel and diameter of wheels; mechanical design and construction; accessibility of engine, gear-box, magneto, etc.; adaptability to various kinds of work; ease of control and safety in handling; ease of turning, and turning radius; facility of attachments; wheel devices; attendance necessary; oil circulation and means of telling whether or not the oil system is functioning; effectiveness of air cleaning and dust-proof construction. The majority of the tractors were fitted with four-cylinder, four-stroke cycle vertical engines, with high-tension ignition and water-cooling systems, although high-speed and low-speed engines were both in evidence. Automatic governors of the throttle type were most in favor, while the oiling systems were either force feed or a combination force and splash feed. The tracklayer type showed to advantage on soft ground, having a better grip with less packing of the soil. The wheel tractors moved over the soft soil quite effectively and have the advantage of less wear on the wheels than the track-laying type, which also absorbed more power. All the tracklayers moved with both tracks on the unplowed land and steering was not affected by the draft. The control of the wheel tractors was affected to some extent by improper hitching and by side draft. All the tractors were fitted with air cleaners, either of the washer or dry-air type. Most of the competing machines worked on paraffin, starting on petrol, excepting two, one using a mixture of the two and another crude oil. All were fitted with

drive pulleys for stationary work, with various degrees of suitability for road haulage.

The results of the plowing tests, as well as technical details regarding the various entries and local prices, are shown in the July issue of the *Journal of Agriculture*, of which a copy is on file in the Agricultural Implements Division of the Bureau of Foreign and Domestic Commerce. The loan of this copy may be secured by addressing a request to the division.

It is unfortunate that costs of oxen plowing under similar test conditions are not available, as they would be of considerable interest. However, the trials have undoubtedly served to focus attention upon the use of tractors and furnished some useful comparative figures. Under present conditions sales will be largely confined to progressive farmers who realize the advantage of the motor-propelled machine, especially in the dry period when the land in the Orange Free State and the Transvaal is sunbaked and cannot be broken with oxen. In other sections of the country the progress of the tractor will be made under more normal working conditions.

While sales for the next few years may not be large, it is believed that South Africa will in the near future offer an excellent market for tractors, all of which will be imported, as local industrial development is not capable of turning out such a highly complex product. Now is the time for American manufacturers to pave the way for future sales in this market by systematic and intensive working of the field, so that they may be prepared for the development and expansion which may reasonably be expected.

## English Char-a-bancs and Motor Buses

**I**N England the char-a-banc or motor bus is taking the place of a private automobile for many people of average means, according to George M. Sprowls, special field representative of The Goodyear Tire & Rubber Company, who was an interested visitor at the Olympia automobile show in London.

The char-a-banc, which carries from 30 to 35 passengers, came into general popularity immediately after the war and has developed rapidly. It is principally used for special excursions to the seashore and countryside. Most char-a-bancs have no tops, but there appears to be a development toward an "all-weather" top. The usual type is split up with long, cross-wise seats, each holding five passengers, with entries by side doors opposite each seat. One rather unusual body exhibited at the show had permanent tops at the front and rear of the car, while the center portion was open. This center portion, however, had windows which could be lowered into the sides and a top that could be rolled back, thus providing either open or closed driving.

Another type of passenger-carrying vehicle which is growing in popularity is the motor coach, which is used for regular trips between towns or for extended tours. These have closed bodies and are quite well appointed. One of the finest cars at the show was a motor coach built to carry 26 persons; the interior was finished in veneered walnut and divided into two compartments. Seats were not arranged in a fixed order, but consisted of leather upholstered chairs arranged as they might be in a drawing room. Each compartment also had a folding table.

Another type had permanent seating arrangements along more conventional lines, with aisles down the center. These seats have high backs and very easy springs, making them unusually comfortable. The bodies are mounted on

pneumatic tires and ride about as easily as a private touring car. This type of car seats about 20 persons.

A more inexpensive type of car was shown, which seats 26 passengers, the whole weighing less than a ton, and selling for \$1400.00.

## Materials Used for Spark Plug Electrodes

**T**HE chemical composition of spark plug electrodes was made the subject of an investigation recently conducted at McCook Field. Chemical analysis indicated that the center electrode is generally pure nickel wire; in some cases manganese was added, probably as a hardener and deoxidizer. In one case the center electrode is a nickel-chrome-iron alloy. The ground electrode in general has the same composition as the center electrode. The tabulation herewith shows the chemical composition of the electrodes analyzed.

# Distributing Channels Important Marketing Factors

Many independent jobbers can handle the work of distribution in a more efficient manner than can the branch house established by a manufacturer. Financial control does not effectuate a greater efficiency in the distribution of a product. The habits of buying must be considered.

By Harry Tipper

**D**ISTRIBUTION has been the subject of more discussion, perhaps, than any other part of marketing work. Channels, methods and values in distribution have been discussed from every angle, but the discussion has not always recognized the functions of distributing operations, the reasons for their growth and present status, the extent to which they can be altered, and the stable portion of their value in any line of work.

The channels of distribution have been used to describe the generally accepted methods for moving the product from the door of the factory to the user, and most of the discussion in connection with such channels has been in relation to the distributors of various kinds who are concerned with the movement of these products.

The functional value of an organization, buying in order to resell, lies in the benefit to the user of the material, in consideration of the following necessities:

1. The more orderly and efficient physical distribution because of the possibility of buying in larger quantities from a single manufacturer and rearranging in smaller quantities the products of a number of manufacturers.
2. The reduction in the cost of selling because of the distribution of the sale over a number of given items, the more intimate territorial contact with those who buy, and the possibility of more intensive work at less cost.
3. More orderly government of production because of the ability to obligate in advance of sale the stabilizing of credit and the distribution of the speculative features of future estimates.

These are functions pertaining to all concerns engaged in buying products from one group in order to resell them to another group. All of these functions enter into the consideration of the value of the present methods of distribution in connection with any line of business. Each individual function varies in its value in the consideration of any particular line, from any other line. The existence of these concerns continues, however, because of their economic value to the users of products in reducing the cost of distribution and increasing the convenience of buying, which in itself represents a reduction in cost.

In all newer lines of business, as they grow up, the methods of distribution and the channels through which the goods flow to the user arise partly out of the traditional necessities of business in the course of its growth. They are not justified or settled until the business has been absorbed into the fabric of social and industrial life for a sufficient length of time to permit the full sway of competition, to exercise its influence in eliminating the inefficiency.

For centuries the producer of commodities has been dependent upon the merchant for the distribution of those commodities, even when the distributing area was comparatively small and the larger portion of the business confined within narrow limits. As the manufacturing consolidated itself into larger and larger units, requiring a correspondingly larger area for the distribution of the products, the number of distributors grew and the business of merchandising subdivided itself into various lines of activities, the number of these subdivisions changing in accordance with the necessities of the different industrial requirements. This change is still going on. Methods that have no other value except through tradition are being abandoned gradually and methods which have established their value persist in spite of attempts to change them on the part of single organizations or industrial groups.

Habits of buying change very slowly—even where the economic advantage ceases to exist. Before the war, United States transactions with South America were paid through London, because the machinery for exchange had been established.

During the recent world war, the practice ceased to well worn channel was used by all concerns in this country and in others where direct communication could have been established. During the war, the practice ceased to a considerable extent, and it was felt in this country that a new channel could be developed for this work direct with South America. Banks have been established in South American countries, branches of banks in this country, and efforts have been made to create this direct communication. They have not been entirely successful and the creation of this new channel will take years to complete, because the habit of buying and the habit of conducting financial transactions is too deeply ingrained to be eliminated with ease, regardless of the economic advantage of doing so.

The same thing is true in regard to the channels of distribution connected with the movement of any product from the manufacturer to the user. As the industrial condition changes, some of these methods lose their economic value and, in the course of time, must be displaced. They persist, however, for a long time after the values have changed because the habit of buying is not easily transferred into a new channel, and it requires a considerable time to effectuate this change.

This persistence of the habit of buying must be reckoned with by all manufacturers who are considering the present methods of distribution and the advisability of introducing a change. It is possible to consume a great deal of time, effort and money in attempting a change

which will be apparently ineffectual because the strength of the habit has not been reckoned with properly, and the new channel of distribution does not groove itself into the fabric as the manufacturer expects it to do.

The discussion upon distribution has been further confused by the tendency to regard the function of the distributor in accordance with the ownership or the financial control, and not in accordance with the operations performed by him. Thus a manufacturer who has erected branch houses in various parts of the country in order to warehouse and job his own products, is apt to consider that he has eliminated the jobber, whereas he has simply assumed financial control of a number of jobbing houses and put his own men in to handle them. In other words, he has gone into the jobbing business with the idea that he is protecting his market thereby.

The only justification for these branch houses is their ability to perform the operations of buying from the factory and selling to the retailers more efficiently than the regular independent jobber.

Similarly, the jobber who goes into the manufacturing business to safeguard his source of supply, does not realize that he is simply assuming financial control of a producing unit, performing entirely separate functions in business and valuable only if the work of manufacturing can be done more efficiently, price and quality considered, than by those from whom he was accustomed to buy his products on the outside. This fact needs emphasis because the manufacturer has frequently confused the control of his market with the efficiency of distribution and has persisted in entering into the jobbing field or even the retailing field on the supposition that financial control would effectuate a greater efficiency in the distribution of his product. There is no greater fallacy than this and, particularly, in merchandising. Even in manufacturing, notice has been taken by industrial engineers of the dangers involved in the centralized system, too large in its dimensions to permit the proper flexibility and efficiency. Walter M. Polakov dwelt very definitely upon this subject in an address before the American Society of Mechanical Engineers at the last convention.

In the merchandising business and in all operations involved in the distribution of goods, this danger of inefficiency arising out of too highly centralized a system, operating over too large an area, is very apparent. So much of the work of merchandising is due to individual initia-

tive and judgment, individual enthusiasm and contact, and the permeation of a spirit of policy from those in charge, that an attempt to control a large area through branch establishments entering into the jobbing business, and even into the retail sales, is very apt to destroy the efficiency sufficiently to make these operations more costly than the distribution through independent concerns.

It is already admitted in the secret councils of some of the largest organizations dealing with general products that their branch jobbing establishments, owned directly by them, are less efficient than the average jobbing establishment independently conducted. It is not necessary, of course, that these establishments should be inefficient, but the tendency to excessive centralizing of control with the corresponding rigidity and lack of flexibility and contact is very marked; so that there is a direct tendency for these distributors to decrease the efficiency.

The purpose of the distribution channels in connection with any business is to merchandise and physically distribute the goods with the greatest convenience to the user, and with the least possible expense to the final buyer. Many of these systems of distribution have been growing for centuries and have been tried and tested during the course of many changes

in business. Their persistence indicates that they have a definite economic value in the scheme of things regardless of their apparent inefficiency, and their lack of enthusiasm in any one line of work. They have been successfully eliminated in very few instances, and there only where the changes in industry had altered the economic situation in that particular.

The manufacturer who considers establishing his branches must recognize the fact that he is going into the jobbing business or the distributing business in doing so, and he must arrange to separate these functional developments from the manufacturing developments so that they will indicate their own efficiency in each individual case by the cost and character of their work and they will not be dependent upon the factory to recuperate from the losses created by their own inefficiency in comparison with independent organizations performing the same work.

In the succeeding articles on this subject, fundamental considerations in the distribution of a product will be applied to the different branches of the automotive business and considered in relation to the specific requirements of these branches.

## A Lattice Tension Wheel

**T**HE Thompson lattice wheel has six component parts—rim, felloe, two perforated discs (1/16 in. thick), axially movable tension member splined on the hub and threaded draw ring at the outer end of the hub. The two perforated discs are riveted and clamped to the rim felloe and riveted to the inside of the hub flange and to the axially movable tension member, which is splined on the hub. The perforated disc is put under tension by taking up on the threaded draw ring at the outside of the wheel, or, in other words, expanding the two discs at the hub. The driving torque is said to be distributed equally between the inner and the outer

discs. The arrangement of the perforations is such that the integral lattice spokes are placed in tension by the driving torque both when moving forward and when backing. This wheel can be built so it can be quickly detached at the hub or it may be made with demountable rims. Claims are made for this wheel in respect to light weight, great lateral strength, attractiveness of appearance, ease of cleaning and retention of finish. If one spoke is broken in an accident, a neat repair job can be made by welding, but in case a considerable number of spokes are damaged a new disc must then be substituted.

## Rebuilding in 1922

A GRADUAL, though definite, return to better business conditions heralds the coming of 1922. As business increases, production will grow and working forces will be rebuilt. The manufacturer has before him an unusual opportunity for production economy in the task of rebuilding his organization.

Efficiency in production depends largely upon the fitness of every man for his particular job; upon the opportunity for development which the work gives to the individual worker. In building up the working force again, the employer has a chance to build, not merely in numbers, but in goodwill and production efficiency. Goodwill between employer and employees means lower unit production costs. And goodwill can be generated rapidly by handling men according to the golden rule even though circumstances do not compel.

You feel a glow of pleasure when you receive a Christmas gift from a dear friend, because you know the gift is voluntary and that it carries with it a spirit of brotherhood. As a result your friendship is made

stronger. Contrast this with the feeling of the burglar who receives "gifts" at the point of a revolver. His friendship with the giver is scarcely improved through the transaction.

It is a far cry, to be sure, from the example given to employer and employee relationships. But there is much in the two cases that carries out the simile. The things which workers are able to force from employers when power is on the workers' side fail to promote goodwill to the same extent as those matters which are settled through co-operative effort.

In the period of organization rebuilding which lies ahead, the manufacturer has an excellent opportunity to lay a firm foundation for future industrial relationships in his plant.

## Making Use of Existing Data

THE Forest Products Laboratory is an organization operated by the Government which, as a result of patient research work, secures information of very great value to all users of wood, and the automotive industry is a very large user of wood. Much of the information collected at the laboratory mentioned is not used, however, for the simple reason that it is not widely disseminated, and even those who receive it do not, as a rule, appreciate its value or understand how to use it to advantage. In short, education is needed and education is best obtained by personal contact with those who know and can explain to those who are interested, many phases of subjects which would otherwise remain of little value.

The Department of Agriculture has long appreciated this fact and spends great sums annually, not only in research work, but in educating farmers in the use of knowledge obtained. Much such work is done by county agents of the department in every State in the Union. A similar force of field men representing the Forest Products Laboratory could do great good by visiting manufacturers of wood products and giving them information as to ways of using wood to the best advantage and with minimum waste.

The current appropriation for the Forest Products Laboratory work amounts to less than 25 cents to every \$1,000 of manufactured value, as against six times as much spent for similar work done by the Department of Agriculture for every \$1,000 of value of all agricultural and animal products. The current budget estimate for the laboratory does not carry the funds needed for this educational work. Those interested in availing themselves of it should see that the Sub-committee on Agriculture of the House Committee on Appropriations, and later the Senate Committee on Agriculture, provide the necessary funds.

## Planning Highway Development

THE recommendation of the N. A. C. C. Highways Committee that Congress immediately appropriate \$100,000,000 annually for highway improvement for a term of five years, warrants support from the industry since it would enable highway plans to be laid out on an efficient basis. The sum involved seems like a huge one, but its very size

makes for economy rather than for extravagance.

If this plan were carried into effect state highway departments would be able to plan their work efficiently and economically. When plans can be laid for only one year, with the possibility of radical revision at the end of that time, it is impossible for any business to function properly. Adoption of this recommendation would enable state highway departments to put their work on a sound basis similar to that of any going business enterprise.

## Fuel Vaporization

OF late distillation curves have been used a great deal to show the characteristics of the fuels marketed. Although these curves correctly represent the vaporization of the fuel under distillation conditions, they are often misunderstood or misinterpreted. For instance, if a fuel has an end point of 450 deg., that does not mean that in order to vaporize it its temperature must necessarily be raised to 450 deg. The whole of such fuel could be vaporized at atmospheric temperature if it were exposed in a shallow dish, and if comparatively dry air were blown over it. Water has a boiling temperature of 212 deg. Fahr., but there is surface evaporation at all atmospheric temperatures. Of course, the higher the temperature of the atmosphere the more rapid the evaporation; another factor affecting the rate of evaporation is the moisture content of the atmosphere. For any temperature and pressure there is a saturation point, that is, a limiting proportion of water vapor which the air will hold in suspension. If the temperature is increased the ability of the atmosphere to absorb moisture is increased.

The same laws apply to the vaporization of liquid fuel in air. The boiling point at atmospheric pressure is that temperature at which the fuel passes into the vapor state when in contact only with its own vapors. If the vapors immediately become mixed with air and the air is greatly in excess, as it is in the carbureter of an internal combustion engine, then liquid fuel will pass into the vapor state and remain in that state though the temperature of the mixture of air and fuel is far below the boiling point of the fuel. The minimum temperature at which fuel will remain in the vapor state when mixed with air in any given proportion is known as its dew point.

There is a very large temperature difference between the end point or maximum boiling point of our present day fuels with air in the proportions ensuring high engine output and high fuel economy. For instance, a 15 to 1 mixture of gasoline and air under atmospheric pressure has a dew point of about 95 deg. Fahr., whereas the end point of the fuel is close to 450 deg. Fahr.

As the vaporization of gasoline in fifteen times its weight of air causes a temperature drop of only about 40 deg. Fahr., there would be no difficulty in completely vaporizing even the present high end point gasoline if sufficient time were available. But in an engine running at 2400 r.p.m. the time for one inlet stroke is only 1/80 second and during this infinitesimal period of time the vaporizing action must com-

pletely penetrate to the centres of the globules sprayed from the carbureter nozzle. This penetrating action is the more rapid the higher the temperature of the mixture and it is this fact which calls for energetic heating of the air previous to entering and of the mixture after it leaves the carbureter. The time required for the complete vaporization of the fuel depends also upon the size of the globules delivered by the spray nozzle which increases as the speed decreases. This is the reason why engines can be operated at full speed without much external heat being supplied to the carbureter, whereas, when operated at low speed without heat supply the carbureter or inlet manifold loads up.

## Coordinated Research

THE importance of studying the relation of highways to the traffic they are called upon to bear has long been uppermost in the minds of highway engineers. The advent of the heavy motor truck as a factor in the transportation system of the country has brought forth new problems and in many States well defined efforts are being put forth to build roads designed for this type of vehicle.

There appears, however, to be a need for a more coordinated effort along this line. An instance was discovered recently in which three highway laboratories were working to determine the same result, and under practically the same conditions. This situation serves to emphasize the benefits that would be derived if some sort of a research information service could be put into effect. Such a service would keep departments in the various States advised as to what was being done in other States.

Insufficient data are at hand at present for the highway engineer to determine accurately the types of roads that will best serve the public. Research and more research is necessary if this all-important work is to be carried on to a successful conclusion. State Highway Departments must cooperate with universities in conducting tests and the results of these tests must be made known to all persons interested. Huge sums of money could often be saved in highway construction if accurate data were at hand as to the type of road best suited to the existing conditions. These savings would have a direct bearing upon the automotive industry, inasmuch as more money would be released for highway construction.

## Happy New Year

THE New Year holds different prospects for different individuals. 1922, like 1921, and every other year, will reward workers. The past year, though a period of business depression, did not turn out nearly so badly as pessimists predicted last January.

Broad vision, intelligent analysis, and a recognition of a moral obligation in industry should characterize 1922 in the automotive industry. For the organizations operating on these fundamentals there is steady progress in store during the new year.

AUTOMOTIVE INDUSTRIES wishes you a Happy and Prosperous New Year.

# Makers Confident as Year Closes

## All But One Quarter Will Be Ahead of 1921

### Truck Market Will Show Improvement with General Business Conditions

By James Dalton

NEW YORK, Dec. 27.—One of the most anxious years in the history of the automotive industry comes to a close with conditions vastly more stable than those which prevailed at the beginning of 1921. The essentiality and the popularity of the motor vehicle have been established beyond question in a period of depression. What the future holds for individual manufacturers and dealers is uncertain but there is no uncertainty about the future of the industry as a whole.

#### Few Failures During Year

It is expected that so far as passenger cars are concerned, the first quarter of 1922 will be materially better than the corresponding period last year, the second quarter a little better than in 1921, the third not quite so good, and the fourth considerably better. The truck market will improve with general business.

The most important achievement of the year, next to the production and sale of approximately 1,700,000 passenger cars and trucks, has been the whittling down and balancing of inventories, the writing off of losses and the payment of debts. There have been few failures of real importance. Only a few companies of consequence have been liquidated. Many have been forced to recapitalize and reorganize, but most of them will pull through.

One of the gratifying developments of the year has been the spirit of co-operation shown by the different branches of the industry in supporting the structure as a whole. Merchandise creditors of motor vehicle makers have consistently maintained a constructive policy. This has resulted in the gradual reduction of past due accounts, and collections from manufacturers now are virtually on a current basis.

#### Defaults in Payments Small

Releases on old commitments have come through steadily as the vehicle manufacturer could use them, and parts and accessory manufacturers have moved a large share of the materials they had on hand on Jan. 1 last. There have been few defaults in payments in comparison with the volume of business. Nearly all vehicle companies which were solidly es-

tablished will survive the depression, although it is to be expected that the number of failures in the next few months will be somewhat larger.

The industry will enter 1922 with a feeling of confidence which was lacking twelve months ago. It knows in a general way what it can expect and can trim its sails accordingly. With inventories down, buying in the future will not be on the hand-to-mouth basis which has prevailed for more than a year, although there will be no more piling up of huge supplies.

Passenger car manufacturers are confident that the coming year will be at least as good as the one just closing, and truck makers expect a steadily expanding volume of business as the year advances. Even if there is no expansion of vehicle production, parts manufacturers will have a better year than in 1921 because inventories have been reduced to a point where it is necessary to buy supplies for current needs.

## Stoughton Will Resume Production After Jan. 1

STOUGHTON, Dec. 27.—Pending the erection of an entirely new fireproof building to replace the motor truck factory destroyed by fire early in November, the Stoughton Wagon Co. is remodeling the manure spreader shop for assembling motor trucks. Work on the permanent truck factory probably will be undertaken about April 1.

The truck plant occupied one of the largest buildings of the Stoughton plant and the loss in the recent fire was well over \$375,000. The blanket insurance on the plant is \$1,230,000. Production of trucks has been seriously delayed for a month, but probably can be resumed immediately after Jan. 1. Orders are being booked at the rate of better than one a day.

## Resolution Asks Transfer of Tractors for Road Work

WASHINGTON, Dec. 24.—Congressman Woodruff of Michigan introduced a joint resolution in the House to-day to authorize and direct the Secretary of Agriculture to transfer 1350 5-ton Holt caterpillar tractors from stock now on hand in the war department, to the highway department of the several states. It is proposed that these tractors shall be used in the construction and maintenance of highways.

It is provided that the Secretary of Agriculture may reserve from such distribution not to exceed 10 per cent. of the tractors, for use in the construction and maintenance of national forest roads and other highways in the public land states.

## Truck Producers to Standardize Cabs

### S. A. E. to Discuss Question—Seating Comfort of Driver Considered

NEW YORK, Dec. 24.—At the suggestion of a truck manufacturer having a large distributor and dealer organization standardization of cabs will be taken up for discussion by the motor truck manufacturers' committee of the Society of Automotive Engineers' standards committee. Such a standardization, it is felt, would eliminate present expense and loss of time through making bodies and cabs interchangeable on different makes of truck of the same capacity.

#### Present Situation Uneconomical

Motor truck users and body and cab manufacturers appreciate the present uneconomical situation but as the quantity production of bodies and cabs is impossible owing to the variation in the mounting dimensions for the different types and makes of motor truck chassis they find it impossible to remedy the situation.

The fundamental dimensions which it is felt must be standardized to obtain the desired interchangeability of cabs are the distance from the windshield to the front of the driver's seat and the width of the seat. The latter dimension has been standardized at about 20 in. in practice but the former varies, depending principally upon the angle of the steering column.

It will probably be found necessary to establish two cab widths or seat lengths owing to the larger crew usually carried on the heavier trucks and also to appearance. Instruments will probably have to be attached to a dash furnished as a part of the chassis. This would save a large amount of time in equipping trucks with cabs as no instrument connections would have to be disturbed.

#### Will Eliminate Drivers' Criticism

The locations of the pedals and levers involve difficulties so far as standardization is concerned and a great deal of study will be required. The standardization of the pedals and levers, it is stated, is not absolutely necessary, however, from the standpoint of standardizing the principal cab mounting dimensions.

Standardization of cab dimensions will mean that the seating comfort of the driver will be assured in all cases. This is regarded as eliminating a great deal of criticism on the part of drivers who desire passenger-car comfort.

# Downward Price Movement Started

## Hudson, Cadillac, Buick Make Cuts

### Most Companies Planning Reductions Will Delay Until New York Show

DETROIT, Dec. 27—The first move toward what is expected to be a general reduction and readjustment of prices on passenger car models in connection with the national automobile shows, has been made a little earlier than anticipated.

The first company to announce lower prices was the Hudson Motor Car Co., which reduced all Hudson and Essex models. This was followed closely by the General Motors Corp., which has made very substantial reductions on the various Cadillac models and a cut running as high as \$270 on Buick cars. The Buick cut probably forecasts keen competition with Studebaker. Many other companies are preparing to follow suit but most of them propose to delay action until the opening of the New York show.

The Cadillac schedule, which shows reductions ranging from \$640 on the touring car to \$940 on the suburban sedan follows:

	Old Price	New Price
Roadster .....	\$3,790	\$3,100
Touring car.....	3,940	3,150
Phaeton .....	3,790	3,150
Sedan .....	4,950	4,100
2 passenger coupe....	5,440	3,875
5 passenger coupe....	4,690	3,925
Victoria .....	4,540	4,540
Limousine .....	5,290	4,550
Suburban .....	6,190	5,190
Imperial Limousine...	5,390	4,600

### New Buick Prices

The schedule of prices on the Buick four cylinder models follows:

	Old Price	New Price
Roadster .....	\$935	\$895
Touring car.....	975	935
Coupe .....	1,475	1,295
Sedan .....	1,650	1,395

The prices on the six cylinder line follow:

	Old Price	New Price
Roadster .....	\$1,495	\$1,365
5 passenger touring car	1,525	1,395
3 passenger coupe....	2,135	1,885
5 passenger sedan....	2,435	2,065
4 passenger coupe....	2,325	2,075
7 passenger touring car	1,735	1,585
7 passenger sedan....	2,635	2,375

### Hudson-Essex Schedule

The Hudson schedule follows:

	Old Price	New Price
4 passenger phaeton...	\$1,895	\$1,695
7 passenger phaeton...	1,895	1,745
2 passenger cabriolet..	2,495	2,295
4 passenger coupe....	2,770	2,570
7 passenger sedan....	3,495	3,250
5 passenger touring		
limousine .....	3,120	2,920

The Essex schedule follows:

	Old Price	New Price
Touring car.....	\$1,195	\$1,095
Coach .....	1,495	1,345
Sedan .....	1,995	1,895

Further Reductions on Page 1294

### PREST-O-LITE CUTS PRICES

NEW YORK, Dec. 23—Reductions ranging from 11 to 20 per cent. on all types of its storage batteries have been announced by the Prest-O-Lite Co. Increased production, it was stated, made possible this decrease. Prices on the line, according to the announcement, are now almost 50 per cent. lower than they were a year ago.

## British Tire Producers Defend Present Lists

LONDON, Dec. 20 (by mail)—A. Johnston, managing director of the North British Rubber Co., Castle Mills, Edinburgh, in discussing band tires, which he points out contain a large percentage of rubber, claims that even to the smallest buyer the prices are 12½ per cent. lower than before the war.

In the case of air tires, he replies to critics, who, noting the fall in raw rubber prices, urge that such tires are too dear, by pointing out that it is cotton and not rubber which figures most in such tires.

(Continued on page 1294)

## Bank Relations Department Will Aid Lexington Dealers

CONNERSVILLE, IND., Dec. 27—A new subsidiary to be known as the Bank Relations Department has been organized by the United States Automotive Corp., one of the units of which is the Lexington Motor Co. It has been established to make a study of improving relations between bankers and motor car dealers. Frank B. Ansted, president of the corporation, is a banker and several directors of the new company also are bank directors.

Through the bank relations department, Lexington dealers will be aided in their financial operations. In discussing this subject, Ansted said:

"Perhaps at no time in the history of the automobile industry has there been a greater need for business methods in the motor car industry."

### MUTUAL BUILDINGS SOLD

SULLIVAN, IND., Dec. 27—The Mutual Truck Co. buildings were sold to Sherman Osborne of Bloomfield, for \$9,750. C. D. Hunt, receiver, conducted the sale. Osborne says his plans are indefinite but that he anticipates reorganization of the company.

## Overland Reduces Parts Quotations

### Some Show Drop of 50 Per Cent —Apply to Current Models

TOLEDO, Dec. 29—Effective in January the list prices on Willys-Overland parts will be reduced an average of 20 per cent in line with the general reductions in the price of cars.

The new low prices available to the public follow the reorganization step taken recently in the sales department of the Willys-Overland through which several distributors were eliminated from the selling organization and the factory gained direct control over more than 80 per cent of its dealers through factory branches.

The new sales program went into effect on Nov. 1. The last two months have been particularly active ones for the Overland parts and sales departments throughout all the branches.

Along the line of better service and stimulus to selling, the company has advanced the discount to dealers from the customary 15 per cent to 25 per cent. Direct from factory sales of parts has enabled part of the middleman's profit to be eliminated.

Fifty important parts have been reduced 33 per cent while a dozen or more showed a drop of 50 per cent.

The new prices apply only to current models of Overland and Willys-Knight cars because quantity production is possible on them.

In making up the new lists of prices to go into effect this month the cost engineers built up several competitive cars from parts catalogs and figuring the lower prices on cars scaled down the Overland parts prices to meet all competition.

## Kroyer Motors Will Move Its Plant to Los Angeles

LOS ANGELES, Dec. 27—Reports that the Kroyer Motors Co., a \$5,000,000 company engaged in the manufacture of tractors at Stockton, would remove its plant to Los Angeles, are confirmed by J. M. Kroyer, president of the company. The present factory at Stockton covers thirty acres and is devoted entirely to the manufacture of tractors and tractor parts.

The Kroyer company was organized in 1917 after Kroyer and those associated with him had sold the Samson Tractor Co. to the General Motors Corp. Since then he has perfected the Wizard 4-pull tractor.

## Program Completed for Tractor Show

Educational Work Will Be Held  
on Four Days in Different  
Sections

MINNEAPOLIS, Dec. 23—The educational program for the seventh national tractor show, which will be held here from Feb. 6 to 11, has been worked out with the assistance of the faculty of the Agricultural College of the University of Minnesota. Members of the faculties of the educational institutions of the Middle West and Northwest will take active charge of the program. The program is designed to give practical, comprehensive short courses.

The proposed lecture program is as follows:

- Room 1  
**MECHANICS OF THE TRACTOR.**  
Tuesday, Feb. 7.
- 10—11 Valve Timing.  
11—12 Bearings.  
2—3 Carburetion.  
3—4 Ignition.
- Wednesday
- 10—11 Lubrication.  
11—12 Slippage lug equipment.  
2—3 Overhauling the Tractor.  
3—4 Tractor troubles.
- Thursday
- 10—11 Valve Timing.  
11—12 Bearings.  
2—3 Carburetion.  
3—4 Ignition.
- Friday
- 10—11 Lubrication.  
11—12 Slippage lug equipment.  
2—3 Overhauling the Tractor.  
3—4 Tractor troubles.
- Room 2  
**APPLICATION OF TRACTOR POWER.**  
Tuesday, Feb. 7.
- 10—11 Plow types, adaptation and use.  
11—12 Plow adjustment—tractor plowing.  
2—3 Seedbed preparation. Tillage tools.  
3—4 Seeding machinery.
- Wednesday
- 10—11 Belt Driven Machinery.  
11—12 Cultivators and Tractor cultivating.  
2—3 Harvesting machinery.  
Binder troubles.  
3—4 Tractor Harvesting.
- Thursday
- 10—11 Plow types, adaptation and use.  
11—12 Plow adjustment—tractor plowing.  
2—3 Seedbed preparation. Tillage tools.  
3—4 Seeding machinery.
- Friday
- 10—11 Belt Driven Machinery.  
11—12 Cultivators and Tractor cultivating.  
2—3 Harvesting machinery.  
Binder troubles.  
3—4 Tractor Harvesting.
- Room 3  
**POWER FARMING PROBLEMS.**  
Tuesday, Feb. 7.
- 10—11 Farm Power.  
11—12 Uses of a Tractor.  
2—3 Tractor farming.  
3—4 Laying out fields for tractor work.
- Wednesday
- 10—11 Belts and Pulleys.  
11—12 Commercial tractor work.  
2—3 Care of the Tractor.  
3—4 Depreciation and acre cost of farm machinery.
- Thursday
- 10—11 Farm Power.

- 11—12 Uses of a Tractor.  
2—3 Tractor farming.  
3—4 Laying out fields for tractor work.  
Friday
- 10—11 Belts and Pulleys.  
11—12 Commercial tractor work.  
2—3 Care of the Tractor.  
3—4 Depreciation and acre cost of farm machinery.

### TRACTOR FORUM. Tuesday, Feb. 7.

- 11—12 Cost records for a tractor.  
2—3 Round table on Tractor Farming led by practical tractor farmers.
- Wednesday
- 11—12 A motorized farm.  
2—3 Round table on Tractor Farming led by practical tractor farmers.
- Thursday
- 11—12 Relation of machinery investment to cost of production.  
Factors affecting cost of production.  
2—3 Round table on Tractor Farming led by practical tractor farmers.
- Friday
- 11—12 Motor trucks on the Farm.  
2—3 Round table on Tractor Farming led by practical tractor farmers.

## Ajax Stockholders to Vote on \$3,000,000 Bond Issue

NEW YORK, Dec. 23—Stockholders of the Ajax Rubber Co. will meet Jan. 11 to authorize the issuance of \$3,000,000 first mortgage, 15 year, 8 per cent. bonds and to ratify an increase in capital from 400,000 shares of \$50 par value to 500,000 shares of no par value. There are outstanding at present 200,000 shares of stock. An additional 200,000 shares will be offered to stockholders for subscription at \$12.50 a share on the share-for-share basis.

A letter sent to stockholders by Horace deLisser, chairman of the board, says that because of expanding business the company has been handicapped by lack of sufficient working capital. He adds that financing arranged through banks and the sale of notes was accomplished by contract which expired Dec. 1. Although for several months prior to that date it was expected the contract might be renewed, the management was notified a short time before the date of maturity that banks and other interests concerned would expect payment Dec. 1. This necessitated the new financing.

## \$191,734 Bid for Assets of American Motors Corp.

PLAINFIELD, N. J., Dec. 23—Receivers of the American Motors Corp. have received from C. B. Penney, representing the "American Motors reorganization syndicate", a bid of \$191,734 including a mortgage for \$55,000, on all the assets of the corporation. The bid provides for an immediate payment of \$10,000; a second payment of \$25,000 on Jan. 15; \$50,000 on Feb. 15 and \$51,734 on March 15.

Creditors of the corporation have been directed by Federal Judge Charles F. Lynch to show cause on Jan. 3 why an order should not be made authorizing the receivers to accept this bid and any other higher bid which may be made.

## Civilian Aviation Gained 20 Per Cent

1200 Aircraft During 1921 Carried  
Approximately 275,000  
Passengers

NEW YORK, Dec. 23—An increase of 20 per cent in civilian flying in the United States this year as compared with 1920 is reported in a review of aviation prepared by the Aeronautical Chamber of Commerce. Twelve hundred aircraft operated by civilians during the past year flew a total of more than 6,500,000 miles and carried approximately 275,000 passengers. The review says:

In the last 12 months aviation has outgrown romance and is now recognized as practical art. The year was crowded with important events, and government, state, municipal officials and transportation experts are agreed that civilian aeronautics must be developed for peaceful transport and as a reserve arm of the national defense.

The U. S. air mail service in 1921 made such a record for efficiency on the transcontinental route that it is recognized as a model for civilian aerial transport the world over. Letters have been delivered in New York two days after casual mailing on the Pacific Coast. The service has an average of 88.82 per cent efficiency, that is, completed trips on scheduled time since it was started in May 1918.

### Societies See Need of Code

Governments of states and heads of Federal bureaus, realizing that fast transport depends upon proper terminal facilities have started campaigns for the acquisition of municipal landing fields. Ordinances regulating aerial traffic have been passed and enforced in scores of municipalities. Almost all large cities have aerial traffic regulations.

State legislatures and municipalities in passing legislation have made it clear that local regulations are temporary and designed to be superseded by the national code when it is effected. The American Bar Association, Aero Club of America, Aeronautical Chamber of Commerce of America, Manufacturers Aircraft Association and the National Aircraft Underwriters Association, the Society of Automotive Engineers and the National Advisory Committee for Aeronautics have recognized the necessity for a national aerial code. Their views have found expression in the Wadsworth-Hicks Bill now before Congress providing for a Bureau of Civil Aviation in the Department of Commerce. This bureau, among other duties, will have supervision over the licensing and registration of all commercial aircraft and pilots and the enforcement of the laws.

### PROPOSE AIRCRAFT MEETING

LONDON, Dec. 20 (*By Mail*)—It is proposed to hold a conference early next spring to discuss the prospects and development of commercial aircraft. The Government and the Federation of British Industries are principally concerned but the personnel of the committee will be representative of both aircraft constructors and users and will include members of trades more particularly concerned with commercial aircraft supplies.

## Reject Interstate Control of Trucks

### Railroads Opposed to Plan Placing Common Carriers Under Commission

WASHINGTON, Dec. 24—Although admitting that motor truck competition had cut down the volume of their short-haul traffic, Bird M. Robertson, president of the American Short Line Railroad Association, told the Senate Committee on Interstate Commerce that railroad officials had rejected a plan submitted by a member of the House of Representatives to place motor trucks engaged as common carriers under the control of the Interstate Commerce Commission.

He declared that an investigation by railroad officials brought the conclusion that it would not be feasible to amend the interstate act in any way to place that class of carrier under Federal control, as it would probably necessitate an entirely new transportation act. This decision was rejected when statisticians showed that the percentage of interstate business handled by trucks was so small that it would probably not justify Congress at this time in dealing with the matter.

### Trucks Duplicate Service

It is significant to note that Robertson told the committee that motor truck lines were developing an extensive duplication of service, that is placing a much greater burden upon the public than the inconsequential duplication of railroad lines.

Referring to the efficiency of the motor truck as a competitor, railroad officials state:

Motor trucks are rapidly invading the transportation field and duplicating the service rendered by the railroads, under conditions that are most unfair and unjust, and are imposing a substantial burden upon the public. Trucks of that character in most of the States are permitted to compete as common carriers with existing railroads without paying anything for the road building or the upkeep, and they are rapidly destroying the roads. In most of the States they are wholly unregulated, being permitted to operate without schedule and without any regulation as to their charges.

### Can Be No Federal Regulation

In connection with the proposal for Federal regulation of motor truck lines, Robertson said:

We are of the opinion that there can not be any Federal regulation. We have investigated that matter and find that only 4 per cent of their business is interstate; something more than 90 per cent of their business is probably intrastate, and therefore it would be very difficult for the Government to meet that situation.

It is also interesting to note that Robertson referred to the interest which other railroad organizations are giving to this duplication of service. He said:

The railroads must not only build and maintain their own trucks but are taxed heavily to create and maintain the highways used by the trucks; operate upon schedule, and are governed rigidly as to the charges they may make. Under these conditions the motor trucks underbid the railroads on the cream of the local business, though they are under no obligation to operate during bad weather. In this way they not only duplicate existing lines and service, but by decreasing the volume of traffic of the railroads they increase the cost of the service of the rail carriers.

Some states have given their railroad commissions authority to regulate motor trucks, but in most of such states the commissions utterly fail to prevent the duplication of the service and fail to require them to compete upon a fair basis.

If there be any duplicated railroads that do not render a real public purpose, they should be abandoned, and the commission has power to accomplish that result.

### Questions Ability to Control

I doubt the ability of the Government to prevent a manufacturing enterprise from running its own motor trucks and rendering service. I refer exclusively, in my statement, to those doing business as common carriers.

Senator Cummins of Iowa, chairman of the committee, pointed out the difficulty in obtaining reliable data on truck movements. Senator Poindexter told the committee that complaint is beginning to arise at a few points throughout the country of State oppression, or State discrimination between certain rivals of common carriers of interstate business, and inquiry is being made as to why the Federal government does not protect them. The Senator said that he had never discovered that any Federal government had in any way ever endeavored to do anything at all about it.

## Spanish Inquiries Grow with Revision of Tariff

NEW YORK, Dec. 23—Inquiries in increasing number from Spain are reported by the automotive exporters here, in preparation for the revision downward of Spanish automotive tariffs, expected early in the New Year. One large company has received an inquiry from one of its Spanish distributors that in itself is larger than all the shipments of completed cars made from this country during the last few months.

In addition, a statement from the foreign office of the Ford Motor Co. is to the effect that the company's business in Spain in November showed a considerable improvement over previous months. It was also stated that an appreciable betterment had been noted in sales to Latin-America.

### MORE BRANCHES FOR PILOT

INDIANAPOLIS, Dec. 27—The Pilot Motor Car Co. of Richmond, according to information made known here to-day, is preparing for the opening of branches in Chicago, New York, Cleveland, Kansas City, Pittsburgh, San Francisco. These branches will be under the direct control and supervision of the main offices at Richmond.

## Blames Propaganda for Gasoline Rise

### Babson Tells of "Manipulation" —Predicts Lower Prices for Automobiles

MILWAUKEE, Dec. 27—Manipulation and false propaganda are responsible for the recent increase in the price of crude oils and gasoline, according to Roger W. Babson, who spoke at a mass meeting of Milwaukee business and professional men under the auspices of the Association of Commerce. Further, Babson said, 15 cent or 18 cent gasoline may be looked for in the not far distant future, although "ultimately the cost of gasoline will make it prohibitive for use in automobiles."

Discussing the outlook for 1922, Babson said:

Business travels in definite cycles. The first is the period of prosperity; the next, period of decline; the next, period of depression; the next, period of recovery. We are now emerging from the period of depression and getting into the period of definite recovery, headed toward "good times." We have been two years traveling the first periods and it probably will take two years on the return road.

Six of the twelve major industries have hit the bottom and turned the corner on the highway to prosperity. Building material, iron and steel, railroad equipment and the automotive industries have still to pass through the worst of the storm. Building materials, automobiles and iron and steel consequently will sell at lower figures in 1922.

Answering a query, Babson said a cut in freight rates would aid the long trunk lines more than the short lines, because of motor truck competition.

## Earl Soundly Financed, Announcement Says

CHICAGO, Dec. 23—In connection with announcements of production of its new line of cars by Earl Motors, Inc., successor to the Briscoe Motor Corp., it is stated that the company is soundly financed. Its financial affairs are in the hands of John Fletcher, vice-president of the Fort Dearborn National Bank.

A controlling interest is held by the Tilden Estate of Chicago in which is vested more than 50 per cent. of the present 200,000 common shares and which, with associates, is underwriting at \$10 a share a new issue of 200,000 shares and \$2,500,000 five year, 7½ per cent. debenture bonds.

### WICHITA MEETING, FEB. 21

WICHITA, Dec. 24—The Wichita Thresher and Tractor Club announces that the twenty-first annual threshermen's convention of Kansas, Oklahoma and Texas will be held in this city Feb. 21 to 24. Oil and steam tractors, trucks and accessories will be included in the exhibits. Arrangements, also, are in progress to put on a tractor parade.

## South Africa Won By Steam Trucks

### British Firms Making Them Have Captured Majority of Heavy Haulage

JOHANNESBURG, Nov. 8 (By Mail) —Steam trucks have taken a firm hold of Johannesburg. British manufacturers, specializing in them, have captured nearly all the heavy haulage in the city as well as in other parts of South Africa. Such trucks are ideal for this country. Coal is cheap and servicing for steam vehicles is not of such a specialized kind as is necessary for motor trucks.

The latest steam truck to arrive is the Leyland, made by the manufacturer of the Layland motor trucks and buses. Other steam trucks that are in use here in fair quantities are Foden, which has the largest number, Sentinel and Robey. A White truck is now on its way up from the coast and will be the first to come to Johannesburg. The local White representative, who is now in Rhodesia on a tour of inspection, is optimistic about motor truck possibilities in this country.

#### Reo Demonstrates

A feature of the last couple of months has been the sale of commercial vehicles and steam trucks. D. H. Saker & Co. has supplied a number of Reo speed-wagons to various large business houses and municipalities throughout the country. These vehicles are demonstrating their usefulness in town and country. Special bodies have been built for use in the northern Transvaal on mail coach service for carrying passengers and baggage.

Farmers are still complaining about the hard times. They have not managed to sell their wool and maize stands at a low figure, there having been over-production this year. But the farmer is showing more inclination to buy automobiles just lately than for the past eight or nine months. Car sales have been better in October than any time this year. The Standard Motor Co. of Africa announces the sale of an average of one Nash car daily and the General Garage has also put over about the same number of Dodge Brothers cars. A feature of these sales is the higher proportion of cash transactions.

#### Merger of Distributors

Hupp Garage, Ltd., has been taken over by the Johannesburg Motor Mart and this merger has cleared the air considerably. These two garages, with some of the largest facilities in South Africa, will now be operated as one concern. They are handling Hupp, Cadillac, Allen and Studebaker cars with the exception of the new light six Studebaker, which is being handled almost exclusively in the Transvaal, Orange Free State, and Natal by B. J. Penny & Co., who formerly were Ford dealers here. The Motor Corp. of Africa now handles Ford cars in the Transvaal.

Rains have made the roads nearly impassable in the Transvaal, Orange Free State, Natal and Rhodesia. With the exception of the town highways and one or two main roads around Johannesburg, Cape Town, Durban and the other larger towns the highways are mostly veld tracks that become inches deep in mud after the first rains.

Naturally the South African motorist wants a car that will take him over these roads in the best possible manner and without the help of a span of oxen or donkeys to pull him out of the mud. This is where the American car scores, being light with plenty of power. The three gear forward system is also better for this country, as the speed given by a fourth gear cannot be used. Pulling is wanted and high average speed.

### Wright Assets Exceed Liabilities, \$355,000

PHILADELPHIA, Dec. 27—Assets of the Wright Roller Bearing Co. for which receivers have been appointed in United States court, are estimated at \$884,000 and the liabilities at \$529,000. W. B. Stratton of New York, one of the receivers, represents the interests of John N. Willys who is the largest single stockholder.

The firm's difficulties began, it is stated when notes amounting to \$400,000 given to Willys when he advanced money for plant extensions were sold by him to interests which demanded payment.

The receivers had been given instructions to continue operations and it is expected the difficulties of the company will be straightened out.

### Sanford Supplements Line With New 1½ Ton Truck

SYRACUSE, N. Y., Dec. 24—The Sanford Motor Truck Co. is bringing out a 1½-ton model equipped with electric starting and lighting, pneumatic cord tires and capable of sustaining a speed of 25 m.p.h.

This will supplement its line of trucks which are made in capacities of 2½, 3½ and 5 tons. The truck is designed by J. E. Gramlich, who recently rejoined the company, after having acted as chief engineer for the Watson Wagon Works for two years.

#### WAYNE WHEEL BANKRUPT

BUFFALO, Dec. 29—A voluntary petition in bankruptcy has been filed in Federal Court here by the Wayne Wheel Co. of Newark, N. Y. Liabilities are placed at \$122,960 and assets at \$182,424. The company is one of the oldest manufacturers of wood wheels.

#### SPECIAL FORD DIVIDEND

DETROIT, Dec. 29—The Ford Motor Co. has declared a special dividend of 3 per cent, payable Dec. 31, to employee investment certificate holders, making a total of 12 per cent for this year.

## Lincoln Tax Claim Cut to \$500,000

### Government Makes \$4,000,000 Reduction—Receiver May Ap- peal from Compromise

DETROIT, Dec. 29—The Detroit Trust Co., receiver for the Lincoln Motor Co., has received word from Washington that the Government's claim for additional taxes will be reduced to about \$500,000 from the \$4,505,681.23 figure first filed. The exact amount of the additional tax is being calculated and will be known in two or three days, according to President Ralph Stone of the trust company. Awaits Definite Figure

News of the Government's reduction was received too late to be available at the meeting of creditors held earlier in the day. President Stone said the receiver was not in a position to determine what action will be taken now that the Government's decision is known, but that immediate consideration will be given to the new situation. Stone expressed his appreciation of the prompt action of the treasury officials. All of these officials realized, he said, that practically nothing could be done in the way of reorganization until the amount of the Government's claim should be fixed and known. May Appeal

Pending the receipt of the actual figure on the tax allowance, the receiver and attorneys for the receiver, will consider whether to accept the Government's compromise on the additional tax, or whether to take a new appeal designed to bring the figure considerably lower. Notice of the Government's action and the receiver's contemplated course has been sent to creditors and to Donald D. Davis, secretary of the stockholders' protective committee at the New York Trust Co., N. Y. This favorable action is expected to expedite greatly the plans of the parties at interest in bringing about a reorganization.

#### Creditors Hold Meeting

At the meeting of the creditors with the receivers to-day a committee was organized to consider future action. C. W. Dickerson of the Timken-Detroit Axle Co. was named chairman of the meeting and John Watson, Jr., Cleveland, secretary. Other members of the committee are W. P. King, president of the Aluminum Manufacturers, Inc., Cleveland, who is its chairman; George D. McCann of the Dayton Engineering Laboratories, O. W. Myers of the Goodyear Tire & Rubber Co. and M. S. Toulson of the Anderson Electric Co.

A sub-committee of the creditors' committee was named to meet representatives of the stockholders and other parties interested to consider plans for the rehabilitation of the company. Although manufacturing plans several months in advance have been laid out by the receiver, it is hoped to effect an early reorganization.

## Overland Contracts Call for 70,000 Cars

### Wilson Says Company Looks Forward to 1922 as Notable Year

TOLEDO, Dec. 24 — Vice-president Charles B. Wilson of the Willys-Overland Co. told members of the Toledo Chamber of Commerce here in franker terms than any Overland official ever used what the actual status of the company is and how it has come through the business of the last year or more.

The Overland is now working about 6000 men, will close a few days for inventory and is expecting to have 8000 men at work by Jan. 15.

In the course of his remarks, Wilson said:

We are looking forward in 1922 to one of our steadiest and most prosperous years. This statement is not based upon idle talk but upon contracts signed with dealers which call for delivery of 70,000 cars in 1922.

We are in shape to start Jan. 1 to build up our working organization so as to get into maximum production as soon as possible and will try to reach the peak production not later than March 1.

The machinery is in order, the department heads are working together and we believe we have nearly 100 per cent co-operation in the whole working force.

### Notes Payable \$18,250,000

In answering the question "What does the Overland plant mean to Toledo?" Wilson said that it had meant in 1920 the purchase of \$17,391,000 in materials from local business firms, and the payment of \$20,573,000 in wages to employees.

He declared there was investment in plant and machinery here of \$40,000,000 and in branches of \$7,000,000 and proceeded to give a view of what had happened to the affairs of the company within the last year and a half.

In March, 1920, the Willys-Overland Co. had notes payable of \$34,400,000 and to-day the notes payable have been reduced to \$18,250,000. On May 31, 1920, accounts payable amounted to \$13,500,000 and to-day they stand at \$2,150,000.

The inventory in the spring of 1920 stood at \$46,100,000 of which experts determined that less than \$5,000,000 worth was in obsolete or surplus materials. To-day the inventory is \$19,000,000 and the surplus and obsolete material is being consumed at a rate which will see its end by April, 1922.

### Commitments Reduced

In July, 1920, the company had material purchase commitments of \$63,000,000. They have been reduced to \$7,000,000 to-day without any lawsuits and with maintenance of goodwill of most of the vendors.

Stocks of cars on hand indicate that the factory will have to get busy in the early months of the new year. Branches had 8476 cars on hand Jan. 1, this year, and now they have 5467 cars. The 4000

dealers had on hand Jan. 1 13,807 cars and to-day they have only 8298 cars. These are all included in inventory figures for the company.

The company has recently revamped its sales organization so that it now directly controls more than 80 per cent of dealers.

"During the first nine months of 1922 we will attempt to run as near an even production schedule as possible," Wilson declared. "The hardest drain on our cash will come in the first three months, according to our estimates. But we will be amply able to take care of our business without outside or unfair financial help."

Wilson said the Overland car was a better product, a proven product, reflected a better working organization and closer inspection and more careful purchase of materials than ever before in its history. He said the company had reduced wages, enforced economies and were enabled to make profit despite the cuts in price on the cars.

"The automobile business is back to normal and is as stable as wool, steel, and other industries," Wilson said.

It has been reported that nearly 800 new dealers have been added in the last month.

## Some Recovery Made in Wisconsin Industry

MILWAUKEE, Dec. 27 — An official statement by the Industrial Commission of Wisconsin says that employment in this State decreased 5 per cent during November. The iron, steel and machinery automotive and motorcycle groups were largely responsible for the reduction. However, it has been apparent in December that some recovery was made, for business has begun to show signs of revival in machinery, machine tools and foundries.

Based on an analysis of reports from 211 establishments with 58,100 employees, or almost one-third of all factory workers in Wisconsin now employed, and a weekly payroll of \$1,245,000, the Industrial Commission gives these figures: Automotive and motorcycle shops: Number employed in November, 3.4 less than in October and 52.9 less than in July, 1920; total wages in November, 12.1 less than in October and 78.4 less than in July, 1920; average weekly earnings in November, \$15.58; in October, \$17.13; in July, 1920, \$32.66.

## Urges Congress to Supply Yearly Fund for Roads

NEW YORK, Dec. 23 — The Highways Committee of the National Automobile Chamber of Commerce has adopted a resolution urging Congress to appropriate immediately \$100,000 annually for highway improvement for a term of five years under the present law. It is believed that this action would result in greater efficiency of expenditure by State highway departments in helping them lay out their programs.

## Makers Outlining Schedules for 1922

### Dodge Anticipates 600 Daily Production—Earl Expects 2000 in January

DETROIT, Dec. 27 — Holiday week with many of the plants down for inventory finds the industry at its lowest production mark since 1920 but preparing to start off with a very decisive spurt immediately after Jan. 1. Many plants have been working during December preparing a stock of complete units in anticipation of a heavy early spring demand.

There has been no stocking of complete cars by dealers this year in anything like the usual proportion and this is expected to mean a heavy production pull at the factories. Dodge, assembling about 150 cars a day, has been building units for 450 cars and storing the surplus in anticipation of a 600 daily production schedule in January.

Earl Motors is rushing equipment for the new models to build upward of 2000 in January.

Ford Motors will resume its heavy production Jan. 3. Men have been ordered to report back on that day and at the offices orders are declared to be consistent with the usual seasonal demand.

### General Motors Program Completed

General Motors units have about outlined the schedules they will proceed upon for the early months.

Factories bringing out new show models are rushing work in preparation for orders on the new vehicles. This list will include probably a majority of companies in the industry, making it a very busy season in the Detroit district but a business of preparation rather than fulfillment.

Enclosed cars at prices not far above open models promise to be the feature of the national shows this year. Detroit will be represented by several manufacturers breaking into this class, the first being Essex Motors. The new enclosed car has a soft padded top with glass the principal constituent of the side structure. A strong bid for enclosed car business, particularly from persons in professional life, will be made with the new models and their appearance promises to create somewhat of a sensation.

## Approve Plan to Change Present Used Car Methods

BUFFALO, Dec. 27 — Resolutions to abolish present methods of dealing with used motor cars, and to establish a national company for their disposal, were approved at a meeting of the local association of automobile dealers at the Lafayette Hotel last night. Copies will be sent to the manufacturers by the dealers in charge of sales in the Buffalo territory and to the National Automobile Chamber of Commerce.

## Government to Have Association Policy

### Hoover Says Few Trade Bodies Come Within Supreme Court's Ruling

WASHINGTON, Dec. 24—With the decision of the Supreme Court in the *hardwood* case considered to be so sweeping that it prohibits numerous activities of trade associations, and does not confine itself merely to exchange of price information, as some believe, business interests of the country are anxiously awaiting the announcement of a definite policy by the Department of Justice on this question. Indications are that the Government will promulgate such a program within the near future. But even this, it is stated, may not be sufficiently assuring to some organizations which insist that their only safe refuge lies in the enactment of legislation which will clearly define their legal status.

#### Automotive Bodies Not Affected

No attempt has been made by Secretary Hoover to interpret the decision, inasmuch as this does not come within his province, but he does not consider the opinion to be so sweeping as do some attorneys who have closely followed the case, and thinks that it will not interfere with co-operation between his department and trade associations. He said that a survey conducted by the department showed that of the 1700 or 1800 trade associations of the country, less than 10 per cent were shown to be engaged in "trade recruiting" in violation of the law. So far as known, all the national associations connected with the automotive industry have a clear bill of health.

His view is not shared by those attorneys who consider that the decision has such a range that it destroys the very principles of trade associations as to the handling of trade information, other than that relating to prices. There is no doubt on the latter point, in the opinion of legal authorities, that exchange of price information is held to be clearly in violation of the Sherman anti-trust law. But some of them go much further and maintain that the opinion handed down through Justice Clarke is much more restrictive.

#### Broad Scope of Opinion Seen

They point to the following portion of the decision:

To call the activities of the defendants, as they are proved in this record, an "Open Competition Plan" of action is plainly a misleading misnomer. Genuine competitors do not make daily, weekly and monthly reports of the minutest details of their business to their rivals, as the defendants did; they do not contract, as was done here, to submit their books to the discretionary audit and their stocks to the discretionary inspection of their rivals for the purpose of successfully competing with them; and they do not submit the details of their business

to the analysis of an expert, jointly employed, and obtain from him a "harmonized" estimate of the market as it is and as, in his specially and confidentially informed judgment, it promises to be.

This is not the conduct of competitors, but is so clearly that of men united in an agreement, expressed or implied, to act together and pursue a common purpose under a common guide that, if it did not stand confessed a combination to restrict production and increase prices in interstate commerce and as, therefore, a direct restraint upon that commerce as we have seen that it is, that conclusion must inevitably have been inferred from the facts which have been proved.

#### Daugherty Favors Associations

It is the opinion of some attorneys that the foregoing reaches far beyond the question of price, although leading up to it, and that it implies violation of the law in handling data such as those bearing upon stocks, production, etc., where the figures are used to restrain trade and fix prices.

Attorney General Daugherty himself, in commenting on the decision, said he was unqualifiedly in favor of trade organizations which confined their operations to improving their service to the public, but he stated they would not be permitted to fix prices or apportion territory among themselves, resulting as it does, he asserted, in restricting competition. Mr. Daugherty proceeded to state that trade associations generally are showing a commendable willingness to confine their activities to the line broadly suggested by the Department of Justice as in conformity with the law. The majority opinion says in making a distinction between the exchange of information among sellers only and between sellers and buyers.

#### Reports Reached Seller Only

In the presence of this record it is futile to argue that the purpose of the "plan" was simply to furnish those engaged in this industry, with widely scattered units, the equivalent of such information as is contained in the newspaper and government publications with respect to the market for commodities sold on boards of trade or stock exchanges.

One distinguishing and sufficient difference is that the published reports go to both the seller and buyer but these reports go to the seller only; and another is that there is no skilled interpreter of the published reports, such as we have in this case, to insistently recommend harmony of action to prove profitable in proportion as it is unitedly pursued.

## Sees in Ship Subsidy Aid for Automobiles

MILWAUKEE, Wis., Dec. 27—Albert D. Lasker, chairman of the United States Shipping Board, in an address which he stated had passed the blue pencil of President Harding, told 700 Milwaukee business men at a testimonial luncheon given in his honor at the Milwaukee Athletic Club, that one of the big business development examples which is a sound argument for a merchant ship subsidy, lies in the automobile and tire field.

## Keen Competition Sighted for 1922

### M. A. M. A. Members See Greater Emphasis Laid on Quality Products

NEW YORK, Dec. 24—A year of keen competition, with good business for the strong companies and greater emphasis than ever before on quality products and service to the ultimate consumer is the outlook for 1922 in the automotive industry, according to a survey of financial executives and general managers of the principal parts and equipment manufacturers.

Prediction concerning the 1922 automobile passenger car and truck production and the consequent unit and accessory business show a considerable divergence, according to the results of a symposium conducted by the Motor and Accessory Manufacturers Association among its members. Many companies report that indications in their own business point to a substantial upward trend during 1922.

#### 30 Per Cent Increase Expected

The figures generally give a range between 20 and 30 per cent as the expected increase, although some manufacturers look for a more profitable year without an increased volume. This attitude is based on the general reduction in overhead and increase in productive and distributing efficiency which characterized 1921 business.

Three large and representative unit manufacturers in Detroit, making respectively automobile bodies, radiators and springs, were the first to answer the association's questionnaire, and without exception they predicted a marked improvement in 1922. The body manufacturer stated flatly that he was figuring on an increase of about 33 1/3 per cent over 1921 sales.

One radiator manufacturer forecasts a reasonable increase in output for those companies well established and giving good value in their product, and predicts that "truck companies should do a considerably greater volume." A spring maker feels that business will be slightly better than 1921 "with credit conditions crystallizing."

#### Sounds Note of Prudence

A note of prudence and conservative judgment is sounded by one of the leading piston-ring manufacturers in America, a company close in touch with many of the "key" automobile companies. He says:

The outlook for next year in the automotive industry, while brighter, does not by any means indicate a return to the unusual sales and marketing conditions which prevailed during the war, which, incidentally, must be recognized by all as abnormal, and a return to normal conditions does not by any means mean a return of the conditions prevailing during or just following the recent war.

(Continued on next page)

## Price Cuts Needed for British Trade

Cost of Bodies, Dealers Assert,  
Is Factor Retarding Car  
Reduction

LONDON, Dec. 20 (*By Mail*)—Information of a reliable nature in relation to production and price prospects must be awaited until the turn of the new year. Automotive factories, generally speaking, are practically closed. Very few firms with the notable exception of Morris Motors are working.

It is a general belief that prices must be lowered before sales can be expected to increase materially. Makers must accept their losses on material purchased before the slump. Daimler has again reduced the price of its "20" model but only by £50. The three categories of cars most desired in this market would be:

1. Not exceeding £350.
2. Not exceeding £700.
3. Not exceeding £1,500.

This estimate is based on a 25 per cent advance over pre-war prices to cover increased taxation and overhead expense. When these costs exceed that mark readjustment must be brought about by economies in management and production costs and by making wider use of specials for gear boxes, axles and engines. It is felt that British factories must come to this method of production.

Dealers generally are agreed that body prices are far too high and are the chief obstacle to bringing car prices down. They range from 200 per cent to 300 per cent above pre-war level notwithstanding the fact that all information points to just as much of a fall in the costs in this branch as in the chassis trade. A cut of £75 would have been the best trade stimulus for the recent show, but instead body builders have evolved another type which they call the "all weather" body and the prices remain where they were.

In connection with bodies it can be stated that Ford is having a slump in the sale of completed cars. Dealers buy the chassis and put other makers' bodies on them. The price averages about £140 for an interior drive, four to seven seater with rattle proof drop glasses and good upholstery.

## Keen Competition Sighted for 1922

(Continued from preceding page)

A representative sheet metal and stamping company in the Detroit district finds distinct promise of a good market in the new year, because of the low stocks now in manufacturers' hands, and changing models which will require a brand new set of parts.

Particularly significant is the following analysis, for it comes from a Michigan company, one of the largest wheel manufacturers in the country:

## NOVEMBER TRADE OF M. A. M. A. MEMBERS EXCEEDS IN VOLUME EARLIER EXPECTATIONS

NEW YORK, Dec. 27—Sales by members of the Motor and Accessory Manufacturers Association for November were only approximately \$3,000,000 less than for October and about \$4,150,000 less than for September. This volume of business was considerably larger than was expected at the beginning of the month. Present indications are that sales for December will equal those for November and may exceed them. November marked the ninth consecutive month with comparatively little variation in the volume of sales.

November brought a slight decrease in the total of past due accounts but a small increase in the total of notes outstanding. It was the first month since August to show a decrease in the total of past due accounts. The total of notes outstanding at the end of November was virtually the same as at the end of September. The figures for each month this year follow:—

Month	Total Purchases	Per Cent Change	Total Past Due	Per Cent Change	Total Notes Outstanding	Per Cent Change
January	\$6,264,587	.....	\$8,099,727	.....	\$4,359,871	.....
February	10,408,962	66.15 Inc.	6,717,165	17.07 Dec.	6,063,118	39.08 Inc.
March	20,120,386	93.30 Inc.	5,603,992	16.57 Dec.	5,069,877	16.38 Dec.
April	26,746,580	32.93 Inc.	5,352,271	4.49 Dec.	5,371,086	5.94 Inc.
May	26,781,350	.13 Inc.	4,505,176	15.64 Dec.	4,460,355	16.77 Dec.
June	22,703,414	15.19 Dec.	4,720,973	4.79 Inc.	4,012,670	10.37 Dec.
July	23,096,214	1.66 Inc.	5,242,046	10.79 Inc.	3,690,154	7.90 Dec.
August	23,397,640	1.31 Inc.	4,348,790	17.06 Dec.	3,494,510	5.30 Dec.
September	23,141,891	1.09 Inc.	4,358,545	00.22 Inc.	3,677,600	5.24 Inc.
October	22,053,327	4.70 Dec.	4,512,680	3.54 Inc.	3,463,500	5.82 Dec.
November	18,998,490	13.85 Dec.	4,382,000	3.56 Dec.	3,661,900	5.73 Inc.

The outlook for 1922 is even better than the outlook was two years ago today for the year 1920. Our business has averaged 70 per cent, each month of this year as compared with 1920, and we have every reason to believe that 1922 will be considerably better than 1921 or 1920.

One automobile engine manufacturer predicts that the year will be 30 per cent better than 1921, while another feels that there will be "a gradual but slight improvement in general business conditions so that by July, 1922, we may hope for what may be a 50 per cent of normal production." We doubt very much whether the production as a whole at the time mentioned will exceed the percentage stated.

A Cleveland manufacturer of various automobile units makes this statement:

The outlook for 1922 is almost as vague as it was for 1921, at this time a year ago. There is, however, a healthier and more optimistic feeling abroad. We have learned to know who are the strong companies in the industry and who are the weak ones. Some of those we thought weak have proved to be exceptionally strong, and vice versa.

The outlook for strong companies for 1922 is good.

The public is not saturated with automobiles; it is merely saturated with second choice and third choice weak automobiles but the demand for strong ones is good.

We do not think, however, that 1922 is going to show much more automobile business than 1921, and we are trimming our sails accordingly. Our reasons for this are many: chiefly, that there has been no increase in business that would place new money in the hands of the wage earners or that would place dividend money in the hands of investors, and until this is done, there will be no buying to speak of, of automobiles.

We believe 1922 will not be worse than 1921. We believe it will be somewhat better and gradually become more so.

## Columbia Motors Presents Bright View of Conditions

DETROIT, Dec. 27—An encouraging picture of the condition of the Columbia Motors Co. is presented in a letter sent to the president of the Detroit Stock Exchange by A. P. O'Connor, secretary and treasurer of the Columbia company. He states that more than 350 cars were shipped in August and more than 300 in September. Thirty new dealer connections have been made in the past two months and trade on the Pacific Coast has improved materially. Dealers in the southeast section have started ordering cars, stating that business is beginning to improve.

In reference to finances, the letter says:

Directors of this company feel confident that we have ample capital to carry us through any reasonable depression that may re-occur during the winter. We have reduced our loans at the banks during the summer approximately \$200,000, and at the present time, or, in fact, ever since we have been purchasing material on the new schedule, we have discounted all of our bills for material.

Our bankers assure us that they have no difficulty in re-discounting our paper at the Federal Reserve Bank, and that our statement makes all of our paper eligible for re-discount for some time to come.

## ASK TRUST FUND ACCOUNTING

FORT WAYNE, IND., Dec. 24 — Stockholders of the Huntington Automotive Co., organized to manufacture articles on which J. Archie Borland has patents, have adopted a resolution to seek an accounting for a trust fund gathered from stockholders of the defunct Rapid Rim Co. of Huntington, Ind.

## British Tire Makers Defend Quotations

Stearns, Oldsmobile and G. M. Truck Make Reductions from Present Prices

(Continued from page 1287)

Egyptian canvas which averaged 22d. per square yard before the war, costs now 52d. Wages are up by 150 to 200 per cent and manufacturing costs are approximately threefold higher.

Cotton, he adds, rose to 16 and 17 shillings per square yard during the war, and apparently this has been the most serious factor in bringing about the present unsatisfactory position of the tire industry.

## Stearns Lowers Prices; Cars Have Cord Tires

CLEVELAND, Dec. 28—The F. B. Stearns Co. has announced reductions on its models for 1922. The prices are as follows:

	Old Price	New Price
Roadster .....	\$2,450	\$2,250
5 passenger touring car .....	2,450	2,250
4 passenger Millitairé .....	2,475	2,275
7 passenger touring car .....	2,675	2,450
Coupe .....	3,400	3,150
Coupe Brougham .....	3,600	3,450
Sedan .....	3,700	3,450
Limousine .....	4,400	4,150
Town car .....	4,400	4,150
Landalet Brougham .....	4,400	4,150

The company provided fabric tires for the prices quoted in 1921 while in the new year it will equip the cars with cord tires at the lower prices.

### SLIGHT REDUCTION IN OLDS

DETROIT, Dec 28—Slight price reductions effective Jan. 1 are announced on part of the Oldsmobile line by the Olds Motor Works. The changes are:

	Old Price	New Price
4 cylinder sedan .....	\$1,845	\$1,795
Small 8 coupe .....	2,185	2,145
Small 8 sedan .....	2,425	2,295
Small 8 touring car .....	1,625	1,595

No change of price has been made on the large eight line.

### G. M. TRUCK LOWER

PONTIAC, Dec. 28—General Motors Truck Co. has announced a reduction in the prices of its chassis effective Jan. 1 as follows:

	Old Price	New Price
Model K 41-2 ton .....	\$3,000	\$2,775
Model K 71-3½ ton .....	4,250	3,950
Model K 101-5 ton .....	4,650	4,350

Model K 16, which completes the line, remains at its former price \$1,495, to which it was recently reduced.

Improved manufacturing facilities and readjusted inventory are stated to be contributing factors to the reduction.

### MAKE USED CAR SUGGESTIONS

NEW YORK, Dec. 28—A wide diversity of opinion on the best means to solve the used car problem is shown in the large

## COBB'S DINNER TALK TO BE ON GASOLINE

NEW YORK, Dec. 28—Irvine S. Cobb, who will be one of the speakers at the annual dinner of the National Automobile Chamber of Commerce on the evening of Jan. 10, has informed Alfred Reeves that his subject will be, "Gasoline, the New National Drink." The other speaker at the dinner will be Secretary of the Navy Denby, who has not yet announced his subject.

number of suggestions received from dealers by the National Automobile Chamber of Commerce in reply to the request for views on the subject.

It is held to be significant that many dealers declare they are opposed to an increase in discounts on the ground that they would be given away in trade. Many dealers endorse the slogan, "Buy Them Right." A further statement of the results of the survey will be made public as soon as an analysis of the suggestions received can be completed.

## Petition Filed in Willys Receivership Proceedings

TOLEDO, Dec. 28—Lloyd T. Williams of the firm of Brown, Geddes, Schmettau & Williams, attorneys here, filed an intervening petition in the Willys Corp. proceedings in Federal court here Tuesday on behalf of the United States Light & Heat Corp., Niagara Falls, N. Y. In the petition the battery company asks that the receivers be required to accept payment of \$802,153 in preferred stock of the United States Light & Heat Co. to cancel a note.

D. H. Kelly, vice-president, was here last week in conference with attorneys. Hearing has been set for Jan. 9.

John N. Willys is chairman of the board of the United States Light & Heat Corp. and C. O. Miniger, who is one of the receivers for the Willys Corp., is president and general manager.

## Bechtel Succeeds Bowser as Pump Company Head

FORT WAYNE, IND., Dec. 29—S. F. Bowser, founder and president of S. F. Bowser & Co., Inc., of this city, manufacturer of gasoline pumps and tanks, has retired from the presidency of the concern to become chairman of the board of directors and S. B. Bechtel, vice-president and general manager, has been named to the presidency.

### FLETCHER LEAVES EARL

DETROIT, Dec. 29—John Fletcher, vice-president of the Fort Dearborn National Bank, Chicago, has resigned as treasurer of Earl Motors, Inc., to devote all his attention to his banking duties. Leon S. Westcoat has been appointed his successor by Clarence A. Earl.

## G. W. Mixter Resigns From Pierce-Arrow

Will Be Succeeded as President  
of Company by M. E. Forbes

BUFFALO, Dec. 29—George W. Mixter, who became president of the Pierce-Arrow Motor Car Co. last May when G. W. Goethals & Co. retired from the management, has resigned. He will be succeeded as president by M. E. Forbes, who has been vice-president and treasurer of the company for some time.

Mixter took active charge of the Pierce-Arrow plant when the Goethals company was employed to assist in bringing the factory to a peace time basis and also to aid in revising its line of cars and trucks.

Colonel Charles Clifton, chairman of the board, in announcing the resignation of Mixter, said he consented last May to remain as president "until certain special work he had inaugurated was completed." This work has not been finished but the president asked to be relieved.

It would not be surprising if the retirement of Mixter might result in a return of some of the former executives of the Pierce-Arrow company. It has been persistently reported for several months that Henry May, who formerly was vice-president in charge of manufacturing, would return.

Colonel Clifton said the plant now is employing about 3200 men as compared with 1800 when the low point of production was reached several months ago. He added that operations in the last few months indicate that the company "has a product which can be manufactured with satisfactory results both to the public and to stockholders."

## Rutherford Will Head M. A. M. A. Committee

NEW YORK, Dec. 28—W. O. Rutherford, vice-president of the B. F. Goodrich Co., has accepted the chairmanship of the foreign trade committee which directors of the Motor and Accessory Manufacturers' Association decided at their last meeting to appoint. He is deeply interested in the export field.

Rutherford will appoint his own associates on the committee and it will work in cooperation with the automotive division of the Bureau of Foreign and Domestic Commerce in developing plans for the expansion of foreign sales by parts and accessory makers.

### FORD WILL NOT CUT

DETROIT, Dec. 28—The Ford Motor Co. in a telegram to dealers denies that prices of its cars will be cut around Jan. 1 as widely rumored. The company says: "As there is no foundation for these reports and we are not contemplating any price changes, we have no hesitancy in making a denial of this report."

# G. M. Starts Year with Clean Slate

## Losses Written Off; Has No Commitments

### Inventory Position Vastly Better Than Year Ago—Market Value May Exceed Book

NEW YORK, Dec. 28—Virtually all the units of the General Motors Corp. will start the new year with their books practically clear of commitments. Large sums have been spent in the past year in the cancellation of contracts on a basis entirely satisfactory to the persons supplying material and the equitable policy adopted by the corporation in this respect has made it many friends.

The inventory position of the corporation is vastly better than at the beginning of the year, as the result of heroic treatment. The new regime has written off its losses and all of them are behind it. It may be found when the inventories are completed that their market value is greater than the present book value, but if this is not the case they will be written down to meet the market so that 1922 can be started with a clean slate.

This policy of General Motors will permit it to turn out its products on the basis of present market costs for materials. It has made possible the sharp reduction in Cadillac prices and a further scaling down of the Buick and Oldsmobile sales prices. The corporation believes the prices of materials are as low as they will go for some time to come and that as a consequence no further price concessions in these lines are in prospect.

General Motors is determined, however, to sell its products at a price which will allow only a reasonable margin of profit. With this purpose in view it is constantly scanning its costs so that purchasers can be given the best values possible. This policy holds good in the export as well as the domestic field. There is no talk within the organization of a possible increase of prices in the coming year.

So far as production for 1922 is concerned, the corporation makes no predictions, but it can be stated that it expects to sell more cars than it did in 1921. It is believed that at the present prices the Cadillac and Buick factories will be kept running at capacity. Chevrolet is expected to continue on the satisfactory basis which has prevailed for months and the output of Oaklands has been steadily increasing of late. The past

## LOS ANGELES GETS LARGEST DELIVERY

NEW YORK, Dec. 28—What is said to be the largest single delivery of automobiles ever made to a retail dealer will be sent this week to Earl C. Anthony, Inc., of Los Angeles, by the Durant Motor Car Co. of New York. The shipment will consist of 500 Durant fours carried in a single train of 100 steel freight cars. The freight charges will amount to \$66,000 and the Durant company has received a draft for \$335,550 from Anthony to cover the transaction. Production at the Long Island City plant of the Durant company is now 75 cars a day.

year has brought many minor improvements in the Chevrolet and Oakland.

Tentative schedules call for a considerably larger output than in 1921. They are based partly on the belief that domestic sales will be somewhat larger and partly on the expectation, which amounts almost to a certainty, that the export business will be substantially larger.

Taking all factors into consideration, General Motors will start the year in a highly enviable position. Really remarkable progress has been made in 1921 in getting the big corporation back to normal and working on a co-operative basis which has strengthened each individual unit.

## Marsh Will Make Chief Address at S. A. E. Dinner

NEW YORK, Dec. 29—Arthur Richmond Marsh, president and editor of the *Economic World*, a former president of the Cotton Exchange and prominent in cotton activities, will be the principal speaker at the annual dinner of the Society of Automotive Engineers to be held at the Hotel Astor on Thursday evening, Jan. 12. His talk will be along economic lines and will deal particularly with the automotive industry.

C. F. Kettering, past president of the society, will serve as toastmaster. Addresses will be made by David Beecroft, retiring president, and B. B. Bachman, president-elect.

Reservations are now being made.

## TEST AIRCRAFT DEVICES

LONDON, Dec. 20 (*By Mail*)—Tests of the devices entered in the competition of the British Air Ministry for safety-fuel tanks for aircraft have commenced at the Royal aircraft establishment, Farnborough.

## Dort to Build Low Priced Closed Cars

### Sedan Will Sell for \$1195, Compared with \$985 for Touring Car

DETROIT, Dec. 28—Dort has added two lower priced enclosed models to its present line, a coupe, selling for \$1165 and a sedan selling for \$1195, as against \$985 for the touring car and roadster. The new models are upholstered in leather and equipped with heater, visor, etc. The older coupe, selling at \$1495 and the sedan at \$1545, both upholstered in brown cloth, are continued.

The refinements in chassis construction include lighter rods and pistons, use of multiple disc clutch in place of the cone type, use of slightly wider face gears in the transmission, adoption of spiral bevel gears in final drive, use of split spring seats with shims between halves, and increased stiffness in fenders, running board aprons, splash pan and some other pressed metal parts. A Connecticut ignition coil, and Alemite chassis lubricating system are now employed.

## Compiles Motorization Facts for Chicago's Use

INDIANAPOLIS, Dec. 27—Figures compiled for the information of Chicago officials show that the garbage collection department of Indianapolis has been able to save \$2.14 a ton by the use of motor equipment.

Before the motorization of the department here the cost of collection ran to \$5.76 a ton for the first five months of 1921. Late in the summer the new motor equipment was bought. In the six months from June to the end of November the department, which had been transferred to the control of the sanitary board, by the use of motor equipment brought the cost down to \$3.62 per ton.

## COLLINS PRODUCTION POSTPONED

DETROIT, Dec. 29—R. H. Collins has postponed indefinitely, it is learned, the bringing out of the Collins automobile and will exhibit at the shows this year only the Peerless line with minor refinements and no change of price. After Collins left the General Motors organization he incorporated a company in Michigan to manufacture a high grade car and so far as can be learned he has not abandoned his plan of building one eventually.

## Aircraft Commerce Chamber Formed

**Will Take Over Some Duties Formerly Assumed by Manufacturers Association**

NEW YORK, Dec. 28—The aircraft industry has formed a national organization under the name of the Aeronautical Chamber of Commerce and has taken over the offices and equipment of the Manufacturers Aircraft Association at 501 Fifth Avenue, this city, which it partly succeeds.

The latter organization will continue to serve its members in handling the administration of the cross license agreement covering airplane patents but the Chamber will assume and greatly extend all of the functions formerly handled by the older organization, including the collection and the dissemination of information regarding aeronautical activities in this and other countries, the publication of the Aircraft Year Book and the furnishing of special services to its members through its various departments and committees.

### Has 100 Charter Members

The new organization, which has been chartered under the laws of the state of New York with approximately 100 members represents virtually every section of the country in the field of designing, construction, operation and kindred activities. Among other things it will endeavor to do will be the development of the market and the increase of the use of flying machines among civilians, corporations and transportation companies.

Its aims and purposes are set forth in the charter as follows:

To foster, advance, promulgate and promote trade and commerce, throughout the United States, its territories, possessions, and in foreign countries, in the interests of those persons, firms or corporations engaged in the business of manufacturing, buying, selling and dealing in aircraft, aircraft motors, and aircraft parts and accessories of every kind and nature.

To diffuse among its members accurate and reliable information as to the standing of its members and those persons, firms or corporations engaged in similar lines of business.

To procure uniformity and certainty in the customs and usages of trade and commerce among its members and those persons, firms or corporations having a common trade, business or professional interest in all matters pertaining to aeronautics.

To aid and assist in mapping out air roads and lanes; the location of landing fields, air-dromes, hangars, or such other structures as may be necessary for the advancement of aeronautics.

To advocate and promote in every lawful way the enactment of just and equitable laws . . . pertaining to aeronautics.

To settle, adjust and arbitrate any and all differences which may arise between its members, and persons, firms or corporations dealing with them.

To promote a more enlarged and friendly intercourse between its members and persons, firms and corporations engaged in the

business of, or dealing in aircraft, aircraft motors and aircraft parts and accessories, and generally to do every act and thing which may be necessary and proper for the advancement of the aeronautical art and industry and the accomplishment of the objects and purposes hereinbefore set forth; provided, however, that nothing herein contained shall authorize this corporation to engage in any business for pecuniary profit.

## Detroit Company May Buy Plant of Maibohm Motors

TOLEDO, Dec. 28—The public sale of Maibohm Motors Co. plant at Sandusky has been postponed indefinitely but negotiations for a private sale are expected to be consummated this week. Approval of the court will be asked for such a plan.

The general reorganization plan will be adhered to, it is asserted, except that a Detroit concern now operating there will bring in new money and organization and continue the Maibohm production along with their other manufacturing at Sandusky. The Detroit company desires to take advantage of economies of manufacture offered by the smaller city.

Chairman E. G. Kirby of the creditors committee said the new plan was looked upon very favorably. Creditors would be given preferred stock in the Detroit company to the amount of their claims. He said most creditors would prefer to have a new management take over operations. Details are being rushed so that announcement may be made at the New York show.

## Expect Export Call for Farm Machinery

ATLANTA, GA., Dec. 24—A general rejuvenation of agricultural activities in all European countries with the use of modern power machinery, and materially better business for the power farming industry in this country during the next two years, is anticipated by American manufacturers of tractors and power farming machinery, according to statements by executive officials of the International Harvester Co., at a southern conference in Chattanooga.

The International, which has large plants in Chattanooga, has reopened three of its large European plants the past year, officials stated, and anticipates capacity production within the next twelve months. The industry has suffered considerable in this country during the long period of agricultural and business depression, but much better times are in prospect for 1922, dealers attending the conference were told.

### BARS ROADS TO TESTS

DETROIT, Dec. 28—A decision by the State Supreme Court withholds the use of State highways for testing motor vehicles, the specific case being a suit by Gratiot County against the Republic Motor Truck Co., Alma. The court held that trucks undergoing tests were not engaged in legitimate traffic and therefore the expense of repairing damage should not be borne by taxpayers.

## Test Road Holds Up Under Heavy Traffic

**Impact Not as Serious in Highway Destruction as Generally Believed**

SAN FRANCISCO, Dec. 27—Traffic alone is not to blame for concrete road failures, according to a report of A. G. Gowans, highway engineer representing the California State Automobile Association, who has been watching results at the circular highway which is being tested to destruction at Pittsburgh, near this city. From Nov. 9 to Dec. 17 a fleet of forty trucks have driven 2,257,450 tons over the highway and on the latter date the road, taken as a whole, does not show any evidence of this enormous traffic.

A number of cracks have appeared but more than half developed before any traffic was put on the pavement. The traffic itself did not seem able to enlarge the cracks with any speed. The evidence of traffic wearing away concrete surfacing, according to Gowans, has also been lacking. "In fact," he says, "on the straight sections of the road no appreciable evidence of wear can be seen."

### Pneumatics Make Little Difference

Gowans further states:

In the opinion of the various engineers who have observed the traffic over the road it is impossible to draw any comparison of it with any thoroughfare in this country. In other words there does not exist any highway to date that begins to carry the traffic that has been put over the Pittsburgh test road. This has therefore shown more than ever that traffic alone is not to blame for concrete road failures.

A few points have now become evident, such as the fact that in a majority of observations a moving load does not produce as great a deflection in the concrete slab as one standing still. Impact has been studied sufficiently to show already that it takes a high rate of speed and a fall of at least one inch to produce deflections in a slab that are at all serious. This must also be done by a vehicle using hard tires that reach any good speed, and the larger the truck the slower its speed. Furthermore, a highway as built to-day and maintained does not offer much in the way of a real rough surface. Impact, therefore, does not appear to be quite as serious a factor as has formerly been the idea.

It is also interesting to know that the experiments made with vehicles using pneumatic tires prove that the impact with air tires produces little if any different deflection than produced by the vehicle merely moving straight along.

### PROTESTS POWER RATES

DETROIT, Dec. 28—General Motors Corp. has filed an application with the Michigan Public Utilities Commission asking for a reduction in the power rates of the Consumers Power Co. A hearing has been set for Jan. 18. General Motors holds that rates filed under the Miller law of 1921 are much higher than formerly.

## G. M. Zones World for Export Trade

### Changes from Plan of Grouping Its Various Products into Divisions

NEW YORK, Dec. 28—Reorganization of the General Motors Export Co., which handles the foreign sales of all G. M. C. cars and trucks, has rapidly followed the appointment of J. D. Mooney, formally of the Remy electric division, as vice-president in charge of operation of the export company. Changes in the personnel already have been made, the most important of which returns Peter Steenstrup, former export chief, to the domestic corporation and names D. A. Laing as sales manager of the export organization. Laing has been in the export organization for several years and has already taken over his new duties.

The export company has given up a former plan of grouping the various products into divisions, with a chief in charge of each, such as Buick, Cadillac, etc. The present plan and the one that Mooney is putting into effect zones the world in various territorial divisions, such as the Pan-American, European, Oriental, Australasian, etc. Each zone will have a chief who will be responsible, with his field men, for the merchandising of all General Motors products in his territory. This system, it is believed, offers better opportunities for intensive merchandising effort.

#### Expects Bigger Year

Another important change elevates S. W. Dorman to the position of vice-president and general manager of the Overseas Motor Service Corp., which handles the export sales of accessories and equipment. Dorman has been nominally in charge of the Overseas company for some time but his position is greatly strengthened by the change.

The export company is preparing for the new year with the expectation that it will be materially larger than 1921. New inquiries and orders contingent upon the price reductions just announced indicate that its position will be much stronger. Working more closely with its foreign distributors, the company expects to gain more intensive sales of its products.

### Tire Companies Start Year in Better Position

AKRON, Dec. 28—The tire companies here will start 1922 in a much stronger position than they were 12 months ago and all of them are looking forward to increased production early in the year. Inventories have been worked down and commitments still held by fabric and rubber producers have been adjusted on a satisfactory basis.

A year ago the Goodyear Tire & Rubber Co. was in the midst of financial difficulties which resulted in a reorganization

but it now has been brought to a strong financial position.

The Firestone Tire & Rubber Co. has taken all its losses as shown by the last balance sheet when assets were reduced from \$107,000,000 to \$75,000,000.

It is reported that the entire indebtedness of the Miller Rubber Co. has been wiped out and the floating indebtedness of the General Rubber Co. has been liquidated.

## FINANCIAL NOTES

Bates Machine & Tractor Co., through Straus Brothers Co., is offering at 100 and interest \$300,000 8 per cent notes due April 1, 1923 to 1927, for the purpose of funding the floating debt and augmenting the working capital.

Miami Cycle & Manufacturing Co., Middletown, Ohio, has increased its capitalization from \$1,371,900 to \$2,500,000, and an outstanding issue of preferred shares amounting to \$2,064,500 has been replaced by an issue of \$1,371,900.

Spicer Mfg. Corp. has declared the regular quarterly dividend of 2 per cent on its preferred stock, payable Jan. 1, 1922, to stock of record Dec. 20, 1921.

Reo Motor Car Co. directors were all re-elected for another year at the annual stockholders' meeting.

F. B. Stearns Co. declared the regular quarterly dividend of \$1, payable to stock of record Dec. 31.

### Offer Awards for Designs at Body Builders Exhibit

NEW YORK, Dec. 27—In addition to the display of passenger car bodies which will be seen at the Body Builders' Exposition which will be held in the 12th Regiment Armory Jan. 9 to 14, there will be a full line for commercial vehicles including dumping bodies, light and heavy panel bodies and omnibus bodies. The management of the show has appropriated \$500 for cash prizes for the best body design. It is stated that more than 40 of the leading designers already have entered the contest.

The contest is open only to individuals. The design must illustrate a complete car with a body which will accommodate four or more passengers. The awards will be based on the merit of the design itself, its fitness for the chassis and its practicability. The body must fit some one of the chassis used in substantial quantities by any automobile manufacturer. The chairman of the committee on awards is William Brewster.

#### DURANT STARTS AT LANSING

DETROIT, Dec. 28—Durant Motors of Michigan has started production at Lansing, although no set schedule will be entered upon until after Jan. 3. Two hundred and fifty men are employed at the start, this number to be augmented steadily as production grows. Until the completion of the Oakland, Cal., plant all far western territory will be supplied from Lansing.

## BANK CREDITS

Written exclusively for AUTOMOTIVE INDUSTRIES by the Guaranty Trust Co., second largest bank in America.

As the year draws to a close money rates have been showing a tendency toward firmness, but the markets have been dull and inactive. Call loans which opened last week at 6 per cent closed the week from 5 to 5½ per cent secured by both mixed and all industrial collateral. For the time loans 5 to 5½ per cent for all periods from 60 days to 6 months' ruled last week as in the week previous. Choice name mercantile paper for all maturities likewise ruled at this rate, money loaning on less well known names at ¼ per cent above the rate for prime mercantile paper. There was but light demand for bankers' acceptances, most of the large institutions being out of the market for the time being. The American Acceptance Council posted rate for such acceptances advanced from 4¼ to 5½ per cent.

The Federal Reserve System in its statement for December 21 reflected considerably larger borrowings by the member banks, bills discounted having increased during the week by \$71,870,000 to \$1,224,703,000. Bills bought in the open market likewise increased materially so that the total bills on hand December 21 of \$1,351,228,000, marked an increase of nearly \$100,000,000 in bill holdings. A feature of the week, however, was the entire disappearance of inter-bank rediscounting of bills, which has been for so long a time the resource of the weaker banks in the South and Southwest.

The holiday demand for currency increased the amount of Federal Reserve notes in actual circulation \$53,783,000 during the week, the total of such notes in circulation being \$2,447,560,000 on December 21, 1921, compared with \$3,404,931,000 of notes in circulation on December 23, 1920, which was the largest amount of such circulation on record.

Deposits of the Federal Reserve System on Dec. 21 of \$1,784,750,000 were \$41,990,000 larger than the week before, the increase being entirely due to a growth in the member bank reserve account, government and other deposits having fallen off. Although gold holdings were enlarged by \$1,821,000, the paying out by the banks of \$10,347,000 in silver and local tenders caused a decline in total reserves which were \$2,993,060,000 on Dec. 21.

#### PURDUE GIVES COURSES

LAFAYETTE, IND., Dec. 27—Starting Jan. 23, Feb. 6 and Feb. 20, three courses in the use of tractors, etc., will be given by Purdue University for the benefit of Indiana farmers or tractor men who are interested in the more efficient operation of gasoline tractors and engines. Those taking any of the three courses will also do a large amount of laboratory work. The lectures will be delivered in the shops or in rooms adjoining them so that all the tractors and parts may be easily demonstrated.

## MEN OF THE INDUSTRY

**L. D. Sasscer** and **W. C. Middleton** have joined the factory sales organization of the Peerless Motor Car Co. to assist in expanding the company's distributing organization. Sasscer has been assistant general manager of the Detroit branch of the Cadillac Motor Car Co. and previously had acted as a specification manager for Cadillac with the Chicago branch and the Philadelphia distributor. Middleton was also engaged in sales work with the Chicago branch of the Cadillac company and the Philadelphia distributor.

**Earl B. Stone**, who for two and a half years has been connected with the Cleveland Tractor Co., as sales representative, district sales manager, and assistant advertising manager, has succeeded **George B. Sharpe** as advertising manager. Sharpe who has been with the Cleveland company for several years, resigned to become associated with the Burroughs Adding Machine Co. Stone has had advertising experience for many years with the General Fire Proofing Co., and the National Acme Co. Sharpe began his association in the advertising field with the Studebaker company many years ago and has been one of the aggressive men in the tractor advertising field for several years.

**Frank K. Bull**, chairman of the board of directors of the J. I. Case Threshing Machine Co., Racine, has resigned, effective Dec. 31, and will retire from active affairs, although retaining extensive holdings in the corporation. Bull, eldest son of the late Stephen Bull, one of the founders of the Case company with the late Jerome I. Case, was born in Racine in 1858. At nineteen he entered the Case works as an apprentice in the repair department. In 1881 he was elected secretary and in 1897 he became president, retiring in 1916 to become chairman of the board. Since that time he has spent much of his time at the country estate at Camden, N. C., with his family.

**F. J. Leyerle** has been appointed service manager of the Franklin Automobile Co., Syracuse, succeeding **Paul Williams**. Leyerle has been acting as assistant to President **H. H. Franklin** since April 1. Before coming to the Franklin organization, Leyerle was associated with the G. W. Goethals Co., industrial engineers, and was assigned by them to the plant of the Splittdorf Electric Co. at Newark, where he acted as assistant factory manager in charge of factory administration.

**Glenn A. Tisdale**, president of the Franklin Motor Car Co. of New York, has been appointed commander of the automobile accessories division in the mobilization of New York business men in the "budget guard," which is being organized by the National Budget Committee. He already is at the head of the motor car dealers division. Tisdale contends that burdensome Federal taxation has seriously impeded motor car sales.

**R. S. Townsend**, general sales manager for the Chevrolet assembly plant in Texas and Oklahoma, with headquarters at Fort Worth has been transferred to Tarrytown, N. Y., where he will be director of sales through the New England and Atlantic seaboard states. He will be succeeded by **L. S. Costly**, now his assistant, while Costly's assistant will be **George G. Beakley**, at present special territorial representative.

**Walter E. Flanders**, chairman of the board of directors of the Rickenbacker Motor Co., will distribute the new car in Maryland, Vir-

ginia and the District of Columbia under the name of Flanders-Rickenbacker Motor Co. Headquarters will be in Baltimore, with branches in Washington, Norfolk and Richmond. **A. J. Jarvis** of Detroit will be general manager. **George Flanders** will be associated with his father.

**J. J. Hunt**, long associated with the distribution of the Reo car in New York, has been given a franchise for the Metropolitan district by the Rickenbacker Motor Co. He will operate under the name of the Hunt Motor Car Co., Inc. Hunt took charge of Cadillac affairs in New York in 1905 and then joined Reo as eastern territory representative, later taking charge of the New York Reo branch.

**George W. Cushing**, advertising manager of the Hudson Motor Car Co. and Essex Motors, has resigned to become associated with the advertising agency of Barton, Dursline & Osborne, Inc., New York City. Cushing will work in the Buffalo office of the company. Before joining Hudson he was advertising director of Federal Motor Truck Co.

**W. H. Girdlestone**, formerly sales manager of the eastern district of Splittdorf Electrical Co., has joined forces with **H. B. Shontz Co., Inc.**, New York distributor of USL storage batteries, as sales manager in charge of battery and electrical service station equipment. Girdlestone has been connected with the automotive industry for nearly twenty years.

**J. J. Cole**, president of the Cole Motor Car Co., and his family have arrived at Cherbourg, France. While ostensibly the trip is taken for recreation, Cole will make a thorough study of economic conditions abroad and of motor car development in European countries. He will visit France and Egypt before returning home, some time in April.

**H. E. Keller**, long identified with the rubber industry as a sales executive, has been appointed director of sales of the Diamond Rubber Co., Inc., Akron. For more than nineteen years Keller was associated with the B. F. Goodrich Rubber Co. and previous to his present appointment served with the Diamond company as district manager.

**Ralph E. Brown**, Buffalo, has resigned as sales manager of the A. W. Haile Motor Co., distributor for western New York, to become president and general manager of the Packard Buffalo Motor Car Co. Before establishing Buffalo connections, in 1909, Brown was assistant manager of the retail division of the Winton Motor Car Co. at Cleveland.

**J. B. Bartholomew**, president of the Avery Co., has been elected an honorary member of the American Society of Mechanical Engineers in recognition of "outstanding service to agriculture particularly in the application of engineering agriculture" through his activities in the farm equipment industry.

**O. H. McCornack** has been elected vice-president of the Hudson Motor Car Co. McCornack, who has been general sales manager of the Hudson company for the last five years, will continue in charge of sales, advertising and service activities in connection with both Hudson and Essex cars.

**Charles H. Domville**, who joined the staff of the Commonwealth Motors Co., Chicago, several months ago in the capacity of district sales manager, has been appointed assistant sales manager. Domville was formerly associated with the Yellow Mfg. Co. as assistant sales manager.

**Peter S. Steenstrup**, vice-president and general manager of General Motors Export

Corp., has been transferred to General Motors Corp. as an assistant to **Albert P. Sloan, Jr.**, vice-president in charge of operations, to undertake special duties.

**Selberling Rubber Co.'s** acquisition of the Lehigh and Portage rubber companies means the discontinuance of the Lehigh and Huskie tires. The plants will be used exclusively for the production of Selberling and Portage tires and tubes.

**J. J. Ritter** has been appointed Michigan distributor of the Visible Pump Co. of Fort Wayne, Ind., of which he has been production engineer for the last year and a half. His headquarters will be in Detroit.

## Some Louisville Dealers Equalled Record of 1920

LOUISVILLE, KY., Dec. 27—A canvass of representative passenger car dealers in Louisville reveals the fact that in 1921 many firms did a volume of business equal to that of 1920. Profits were not so great because of the reduced list price on all makes of cars, but the number of sales held up remarkably well for those dealers who kept hard at work.

On one make, the local sales of new passenger cars increased 45 per cent in 1921 over 1920. There was a marked tendency in December toward rush business. This followed a rather quiet fall. December, with the added impetus given it by Christmas gift suggestions and advertising, tried by local dealers on a wide scale for the first time, offset the loss of quiet business in the preceding month.

## Former Chevrolet Head and Buick Founder Dies

FLINT, MICH., Dec. 27—**C. C. Begole**, formerly president of the Chevrolet Motor Co. of Michigan, died in St. Petersburg, Fla., Thursday, according to advices received here. Besides his association with the Chevrolet company, Begole was one of the founders of the Buick Motor Co., of which he was the first president, and was also one of the leaders of the Flint Wagon Works, the pioneer vehicle industry of Flint.

He was a son of **Josiah Begole**, who was formerly governor of Michigan and one of the founders of the Flint Wagon Works.

## BRITISH ENGINE LOSS

LONDON, Dec. 20 (By Mail)—The **W. H. Dorman Co., Inc.**, at Stafford, manufacturer of engines for cars, trucks and tractors, report a loss of £223,292, after crediting £196,582 taxes since recovered. For the trading year 1919-1920 the company showed a profit of £72,980 and carried forward £43,947. It paid 10 per cent dividend on common stock and 9 per cent on preferred.

## NEW ROAD FROM LIMA

LIMA, PERU, Dec. 4 (By Mail)—The construction of a concrete toll road between this city and Callao, its port on the Pacific Ocean, has been authorized in a concession recently granted. The new road will be 10,250 meters in length. Its width will be seven meters. The work must be started within six to eight months and completed within 18 months.

## INDUSTRIAL NOTES

Edmund S. Wolf, Bridgeport, Conn., has been appointed temporary receiver for the Coe-Stapley Mfg. Co., West Haven, Conn., maker of automobile and bicycle pumps and sheet metal products, upon application of creditors who filed a petition in bankruptcy against the company. The company was organized in 1918 and has a capitalization of \$950,000. R. E. Carpenter, Boston, is president and Robert R. Adams, Bridgeport, treasurer.

American Motors Service, Pittsburgh, Pa., has been formed by G. E. Burroughs, I. V. Conneely and associates for the purpose of leasing a chain of service stations and distributing parts and equipment direct from factory, private garage equipment and tools complete. Sales offices forming in Pittsburgh, Cleveland and Toledo will open May 1, 1922.

Edward G. Kirby has been appointed receiver for the Zenith Tire & Rubber Co., Cleveland by the Federal court at Toledo. Kirby is trust officer of the Commerce Guardian Bank, Toledo. His bond has been fixed at \$10,000.

Cutler-Hammer Mfg. Co., Milwaukee, has moved its Boston office from the Columbian Life Building to the Harvety Building, Chauncy Street. C. W. Yerger is manager of the Boston office.

Giant Tire & Rubber Co. has moved its operations to the plant formerly owned by the Grant Motor Car Corp. at Findlay, Ohio, and is adding \$300,000 new capital for the purpose of business expansion.

Republic Rubber Co. is reorganizing its sales department and re-establishing agencies preparatory to a nation-wide campaign. No move will be made toward reorganization until after Jan. 1, 1922.

Percival Wilds has been appointed receiver for the Manhattan Motors Corp., New York City, under \$5,000 bond. The liabilities are stated to be \$100,000 and the assets about \$25,000.

## Dallas Sold 30,000 New Cars During Year

DALLAS, TEX., Dec. 27—Dallas automobile dealers have sold 35,000 cars this year despite the fact that times have been called dull and money tight. Of that number 30,000 were new cars valued at more than \$30,000,000. Five thousand used cars were sold at \$2,500,000.

This is the estimate made by half a dozen dealers as the year was closing, and some of the dealers assert the sales might run a thousand cars more. Of the total number, 12,000 were sold by retailers in Dallas and the remainder by the wholesale houses here.

The last two weeks of the year are proving banner ones, according to retailers. This was due to the large number of cars sold as "Christmas" presents and general cleaning up of stocks for the first of the year.

### BETHLEHEM REFUSES OFFER

ALLENTOWN, PA., Dec. 23—Local creditors of the Bethlehem Motors Corp. have been informed by Clinton E. Woods,

the receiver, that an offer of \$400,000. had been made for the plant, but that creditors' committees had decided not to sell for less than \$750,000, although the plant has deteriorated rapidly since operations were discontinued. Claims than \$3,000,000 and creditors will not realize more than 20 cents on the dollar. against the company aggregate more

## Philippines Resist Prohibitive Taxation

LOS ANGELES, Dec. 27—Automobile dealers and motorists in Manila, Philippine Islands, have successfully resisted, at least for the present, the efforts made to impose a prohibitive tax on all cars in use in that city. The new motor vehicle tax that was recently placed in effect was the one largely sponsored by the dealers as reasonable.

The tax rates are as follows:

(a) passenger motor vehicles, Pesos .25 per horse power (Peso 50 cents U. S. money) and one centavo (1 centavo equals \$0.005) additional for each vehicle with pneumatic tires and two centavos for those with metal tires; (b) for trucks, passenger or freight or both, 40 pesos per ton capacity and one centavo additional for each additional kilo of capacity; (c) trailers, 10 pesos for those of less than two tons capacity and 20 pesos for two or more than two tons capacity; (d) motorcycles with no side cars, 3 to 5 pesos.

The ordinance will only be in effect until the Legislature of the Philippines, now in session, passes legislation to cover the entire islands.

## Transport Has New Line of Specialized Trucks

MT. PLEASANT, MICH., Dec. 27—The Transport Truck Co. will begin the year with a new line of specialized trucks at reduced prices based on present costs. The company will feature six models, or two more than it had previously. The line includes: Model 15, "Rapid Transport," 1-ton, equipped with pneumatic tires, at \$1,295; Model 25, 1½-ton, \$1,495; model 35, 2-ton, \$1,885; Model 55, 3-ton, \$2,385; Model 60, 3½-ton, \$2,585; Model 75, 5-ton, \$3,485.

The old prices on transport models have been: 1-ton, \$1,395; 1½-ton, \$1,995; 2½-ton, \$2,785; 3½-ton, \$3,885.

The models 35, 55, 60 and 75 are all equipped with drive shaft brake, 4 speed transmission and electric lights, bumper, hubodometer and Moto-Meter.

## Delaware to Enforce Law Covering Motor Lenses

WILMINGTON, DEL., Dec. 27—Following a motor lens test held here under the direction of State officials, announcement was made by the Secretary of State's office that an official list of lenses permissible in this State, will be published about Feb. 1. It was said, also, that rigid enforcement of the law regarding lenses will be started at that time. The law was enacted three years ago, but has not been rigidly enforced.

## METAL MARKETS

NEVER productive of anything very startling in the way of market activity or developments, the last week of the year ran true to form. An auspicious omen, however, is the large amount of preliminary correspondence with reference to 1922 deliveries of automotive steels. Some automotive interests are sounding the market not only regarding first but also second quarter shipments, especially of sheets. The firmness of the sheet market which is laid special stress on in steel circles is undoubtedly due to the anticipation of a heavy automotive demand over the next few months.

The usual end-of-the-year report that the Ford Motor Co. had entered actively upon covering its first quarter 1922 sheet requirements was in circulation last week. Undoubtedly all automotive manufacturers have provided themselves with the steel tonnages necessary for their initial operating schedules of 1922, and the orders which are looked for to be placed in the next few weeks pertain to February and March shipments.

It will probably be the middle of January before a general resumption of activity in the steel industry takes place. From that time on steel producers look for a steady rise in the demand upon their output, the prevailing impression in the trade being that by April or May the industry will have re-established itself on a satisfactory basis of operations.

The explanation for this condition is that, because of its moderation in the matter of prices during the 1920 flurry, many consumers give corporation subsidiaries the preference at even prices while others will go so far as to pay them \$1 or \$2 a ton more than the lowest price quoted by "Independents." Conclusive evidence of this sort that a conservative price policy proves most remunerative in the long run is likely to have a salutary effect upon the market. The iron and steel industry awaits with much concern the result of hearings to be held Jan. 21-23, 1922, when the Interstate Commerce Commission will inquire into the equity of rates on ore, furnace materials and iron and steel articles.

Pig Iron.—Although the market generally rules quiet, pig iron sellers report better interest in foundry and malleable on the part of automotive foundries. The tone of the market continues easy.

Steel.—Some of the non-integrated sheet mills are reported to have been able to place contracts for 1922 deliveries of sheet bars at as low as \$28.50 a ton. A few weeks ago the market was considered to be between \$30 and \$32. It is claimed for the sheet market itself that not in a long time has it been as steady as it is now and that orders offered at below the prevailing quotations of 2.25c. for blue annealed and 3c. for black have been turned down. In spite of this, one encounters here and there rumors of slight price shading by small independents. Activity in strip steel and screw stock is apparently held in abeyance until after the New Year holiday.

Aluminum.—No change has come over the market and, while some tonnages of imported metal are reported to be the subject of negotiations between brokers and consumers, price levels have undergone no revision.

Copper.—The usual end-of-the-year calm prevails in the market for the red metal. Sentiment, however, is very cheerful. The trade looks upon the absorption of the American Brass Co. by the Anaconda Copper Mining Co. as an accomplished fact.

## SHOWS

- Jan. 7-12—New York, National Automobile Show, Grand Central Palace. Auspices of N.A.C.C.
- Jan. 9-14—New York, Motor Car Body Exposition, Automobile Body Builders Association. Twelfth Regiment Armory.
- Jan. 28-Feb. 4—Chicago, Automobile Salon, Hotel Drake.
- Jan. 28-Feb. 4—Chicago, National Automobile Show, Coliseum. Auspices of N.A.C.C.
- Feb. 6 to 11—Seventh National Tractor Show and Educational Exposition, Minnesota State Fair Grounds, Minneapolis.
- Feb. 6 to 11—Winnipeg, Can., Automotive Equipment

Show, Western Canadian Automotive Association.

## FOREIGN SHOWS

- March, 1922—Santiago, Chili, Annual Automobile Show.
- April 16—Mexico City, Annual Automobile Show, Auspices of the Automotive Division of the American Chamber of Commerce.
- April 22-May 1—Prague, Czechoslovakia, Fourteenth International Automobile Exhibit.
- May, 1922—Quito, Ecuador, Agricultural Exposition, celebrating Centenary of Ecuador. Automotive Section.
- Sept. 1922—Rio de Janeiro, Brazil, Automobile exhibit in connection with the Brazilian Centenary Association Automobilista Brasileira.

## CONVENTIONS

- Dec. 20—Philadelphia, American Society of Mechanical Engineers.
- Dec. 27-29—Chicago, American Society of Agricultural Engineers, Auditorium Hotel.
- Jan. 17-20, 1922—Chicago, American Road Builders Association.
- Jan. 30-31—Chicago, Fifth Annual Convention, N. A. D. A., La Salle Hotel.
- Jan. 30-Feb. 2—Boston, Sixth Annual Conference of the International Delivery Association, Copley Plaza Hotel.
- May 10-12—Philadelphia, Ninth National Foreign Trade Convention of the National Foreign Trade Council.

- June 11-15—Milwaukee, Annual International Convention of the Associated Advertising Clubs of the World.
- Sept. 18-22, 1922—Rome, Italy, Second Annual Meeting of the International Chamber of Commerce.

## S. A. E. MEETINGS

- Detroit, Feb. 24, Mar. 24, April 28, May 26.
- New York, Jan. 10-13, 1922—Annual Meeting.
- New York, Jan. 16, First Annual Meeting of Advisory Board on Highway Research, Engineering Societies Building.
- Chicago, Feb. 1
- Minneapolis, Feb. 8-9—Annual Tractor Meeting.

## November Exports Total \$5,000,000

Declined from October, But Reach Business Transacted in September

WASHINGTON, Dec. 27—Automotive exports in November, not including tires, totaled almost \$5,000,000, according to figures announced by the Bureau of Foreign and Domestic Commerce, thus reaching a total somewhat smaller than the foreign business done in October but practically on a par with that in September and larger than that of August and July. Total exports in November covering cars, trucks, parts, motorcycles and airplanes were \$4,921,887, according to the Bureau statement.

The total represented slight recessions from those recorded in October, which in their turn were the largest in the present upswing of our overseas trade in automotive equipment. Motorcycles alone in November represented higher figures than in the preceding month. Passenger car exports for November were one-tenth smaller in number than in October and motor trucks declined about one-fourth.

The figures for the November sales follow:

	No.	Value	Unit Value
Passenger cars			
Completed vehicles.	1,616	\$1,509,143	\$934
Chassis	459	338,047	736
Total	2,075	\$1,847,190	890
Motor trucks			
Completed vehicles.	226	\$192,094	850
Chassis	201	172,300	857
Total	427	\$364,394	853
Parts		\$2,546,424	
Motorcycles	500	144,696	286
Airplane parts		19,173	

The largest importer of American passenger cars, as in the previous month, was Mexico, followed by Australia, Canada and the United Kingdom. Mexico likewise leads the list in the purchase by

number of motor trucks, followed by Japan, British Oceania, Canada and The Netherlands. By value, the truck purchases went to Mexico, Canada, British Oceania, Japan and the Philippines. Details covering the shipments of parts were not announced.

## McQuay-Norris Acquires Business of Wainwright

ST. LOUIS, Dec. 27—The McQuay-Norris Mfg. Co. of this city, manufacturer of piston rings, announces that it has acquired the plant and business of the Wainwright Engineering Corp. of Connersville, Ind., which manufactures Wainwright pistons and pins. The business will be continued in Connersville under the name of the McQuay-Norris Mfg. Co. of Indiana. Plans are already under way for plant changes and additions to increase the output.

Harry A. Wainwright, who has been the active head of the Wainwright Corp., will become treasurer and general manager of the new Indiana company and will continue as general manager of the Connersville plant. Paul J. Barnard, vice-president and sales manager of the Wainwright company, will be secretary of the new company. Sales will be taken over by the McQuay-Norris Mfg. Co., which has 15 branch offices and thirty-five field representatives.

## Benz Works, Mannheim, Buy Rumpler Patents

BERLIN, Dec. 12 (*By Mail*)—The Benz works at Mannheim, producer of high quality cars and the "Blitzen Benz," have decided, after exhaustive tests of the Rumpler car, to buy the sole license for Germany of the Rumpler patents. The tests lasted for about six weeks, during which the 30 hp. Rumpler car was compared with 50 to 60 hp. Benz and other cars of similar quality in speed, hill climbing, fuel consumption, tire consumption, comfort of passengers, etc.

## Registrations Show Increase in Oregon

Cars Gain 14 Per Cent During Year; Growth Greater in Trucks

PORTLAND, ORE., Dec. 17—Latest registration figures for automobiles and motor trucks in the State of Oregon show a gain of 14 per cent in the number of automobiles since the first of the year and a gain of 15 per cent in trucks. On Jan. 1, 1921, there were 103,414 automobiles, while at the present time there are 118,169, a gain of 14,755. Trucks at the beginning of this year numbered 12,856, while they now number 14,747, an increase of 1889.

The figures show a steady and substantial sale of motor vehicles throughout the year, and the fact that trucks showed a percentage gain slightly greater than automobiles came as a surprise.

## Agricultural Districts Decline

Analysis of the figures shows that the larger towns and cities and industrial areas of the State showed practically all the gain in automobiles, the agricultural communities presenting little increase and in some instances loss in vehicles registered. Forty per cent of the gain was in Multnomah County (Portland). Eastern Oregon, the agricultural section of the State, showed a loss of 1 per cent in registrations.

Sales of new cars throughout the State showed a considerable slackening up in November as compared with October, while December is not expected to run ahead but possibly may fall a little behind November. During November 25½ cars per day on the average, or a total of 777 new cars, were sold, as compared with 49½ per day, or 1485 for October. This is for the entire State, but the same ratio holds true in Portland, where approximately one-half of the new cars are sold.

# "NORMA"

## PRECISION BALL BEARINGS

(PATENTED)

The useful life of a "cheap" car, or truck, or tractor, or power boat, is usually so short that its first cost is still a vivid memory. On the other hand, with automotive units of the better class, the term of useful service is so long that first cost is forgotten. It is in cars, trucks, tractors and power boats of the latter class that "NORMA" equipped ignition apparatus and lighting generators are found. Their performance helps to put price—first cost—so far behind as seldom to be recalled.

See that your electrical apparatus is "NORMA" equipped.

## Refined Basic Open Hearth Alloy Steels

THE acceptance of Interstate Basic Open Hearth Alloy Steel, by an increasing number of Automobile, Motor Truck and Tractor Manufacturers, because of fully meeting their exacting specifications is a matter of pride with us. We ascribe this enviable record to the following causes:

1. Skill of our metallurgists in developing and conducting refining processes in the furnaces, during the melting period.
2. Use of carefully selected raw materials, properly combined in each heat, with special reference to the analysis sought.
3. Specialized design and equipment of our Basic Open Hearth Alloy Steel plant at South Chicago—a well-balanced, scientifically-correlated UNIT for the production of one class of product—REFINED ALLOY STEEL.
4. The definite purpose of the whole Interstate organization to make QUALITY paramount; and thus to earn a reputation for INTERSTATE PRODUCTS that shall insure a demand for our maximum tonnage.

## For 1922 Here's Wishing That

**W**E may be as powerful as a clean motor, well made, and fitted for the job; running smoothly regardless of any outside conditions, with much reserve as an accelerator capable of all emergencies, but wasting nothing.

Lubricated with good will and cooperation, moving freely, without stop or interruption.

Governed by the spark of intelligence, at the full heat of initiation, timed for the right work at the right place.

HARRY TIPPER

## The Deep Groove Radial Bearing as a Heavy Thrust Carrier

**W**HEREVER radial and thrust loads are carried in combination, the deep groove bearing is the logical as well as the practical choice. The exaggerated view above shows how such combined loads are transmitted.

The thrust capacity of the deep groove bearing is at least as high as its radial capacity and for average speeds may exceed the radial rating of the bearing. Moreover the deep groove bearing is a reversible thrust carrier—it will successfully operate when mounted either way.

The deep groove bearing is especially adapt-

able to locations where the radial and thrust components are subject to continual variations. All parts of the bearings are designed to withstand these varying conditions. This means adequate bearing service and consequently increased life for your machine.

The deep groove bearing is a product of The Hess-Bright Mfg. Co. and is sponsored by the **SKF** Industries, Inc. Its manufacture embodies all the minute care, precision and quality for which the mark **SKF** stands. The world-wide experience of this organization is put at your disposal, free of any obligation on your part.

# EATON

CHARLES GUERNSEY, CHIEF ENGINEER, SERVICE MOTOR TRUCK CO.,  
WRITES UNDER DATE OF OCTOBER 6, 1921:

Gentlemen:

Your Model 1000 axle has come through *with an absolutely clean score* on all of the many severe tests to which our Model 15 truck has been subjected.

*High Speed  
One-Ton Truck  
Makes Record*

Among these tests may be mentioned a 1200 mile trip through the Alleghany Mountains and back to Wabash; a trip of 369½ miles from Wabash to Lima, Ohio; thence to Dayton, Richmond, and back to Wabash, on which trip the average speed (exclusive of time and mileage within the cities) was 35½ miles per hour. About one-half of this trip was made in the rain.

*Model 1000 Axle  
Comes Clean*

The sample axle under the experimental truck has been driven some 15,000 miles. During this time the bearings have been once adjusted and the brakes once relined. During these tests the experimental truck has carried anywhere from 1500 to 4000 pounds net load. The engine used ahead of this axle develops 39 H.P. and 1800 R.P.M. and, consequently, is capable of inflicting *considerable punishment on the rear axle*.

The truck has been in production some seven months, and we have yet to have any serious difficulties from the field.

As a result of the above you can well appreciate that *I am thoroughly sold* on your Model 1000 axle.

Yours very truly,

CHARLES GUERNSEY,  
Chief Engineer,  
The Service Motor Truck Co.

# Fitted as Finely as a Tappet

Like a valve tappet in its guide, a Lavine "Pilot" trunnion block must be an *oil fit* in its slot.

The block itself is a typical bit of Lavine workmanship. It is made of chrome alloy steel, hardened and ground all over. Through five distinct operations it is held to limits of .001" plus or minus.

This precision workmanship assures smooth travel of the trunnion block in its slot in the sliding head—plays a big part in the silky action and great durability of the Lavine "Pilot"—*the new standard of steering gear value.*

To discriminating car manufacturers this gear is offered as the masterpiece of a "hand picked" organization of gear specialists. The more carefully you compare the Lavine "Pilot" with other good steering gears the more you will appreciate the "Pilot's" greater durability, simplicity, smoothness of action, ease of adjustment and freedom from rattling. We invite competitive tests on these points.

**LAVINE GEAR CO.**

### The FAY-WAY of Machining CRANK SHAFT ENDS

is outlined here. The Fay Way is equally as efficient in machining a great variety of automotive parts. Our engineers will be glad to co-operate with you in devising better methods in production of your standardized parts. Send sample piece or blueprints to us for estimate.

Fourteen tools, cutting simultaneously, finish both ends in time of longest cut—

#### Two machines—one operator

The crankshaft is held between centers in a special fixture and supported by a pot chuck. The carriage rocks in and moves toward the tailstock, turning outside diameter of flange and end bearing. The back arm rocks in and faces, as shown.

This completes the cuts on one end, after which the shaft goes to another Fay Automatic and the other end is finished. One operator handles the two machines and as the machines are both cutting at the same time, the crankshaft ends are finished in the time of the longest single cut, which gives a production, from floor to floor, of twenty shafts per hour.

# On the Oldsmobile Eight

*There are probably  
no plants in the  
country surpassing  
in equipment the  
new plants of the  
Olds Motor Works*

Economy, accuracy and record results feature production on the new Model 47 Oldsmobile in the new plant of the Olds Motor Works, Lansing, Mich.

171 blocks per day are being produced in the cylinder block department with an average of 16 pounds of metal removed from each block.

The picture is of a Milwaukee 3B Milling Machine provided with five cutters, milling the intake manifold flange. This Milwaukee takes both the rough and finish cuts on all the blocks. It is capable of handling from 20 to 25 blocks per hour. Another Milwaukee, with a single cutter, mills eight bolt hole faces and spot faces two bolt holes.

The wide use of Milwaukee Milling Machines in the automotive industry compels the belief that they "make good." For information on your next installation of milling equipment, dictate a request for Catalog 22.

**The Double Overarm maintains  
permanent alignment of the arbor.**

## Consult Our Production Engineers

A production man from a large factory, which has a reputation for its up-to-date production methods, put the problem to us this way:

"We must reduce the cost of finishing these moulds for electric light bulbs. It is not customary to finish them on turret lathes, but we think *your* turret lathes can do the work as well and in less time."

(They have Warner & Swasey turret lathes in their shop doing other work.)

The turret lathe and tools we furnished do the work in one-fifth the previous time. And their operator expects to do better than that when he becomes accustomed to the job.

You have jobs that should cost less. Send us blue prints of them. You'll be surprised at the saving we can show you.

# Begin Now to Sell Automobiles to Farmer-Oklahomans in 1922

## Here Is Proof

—that Oklahoma is one of the very best farm markets, *right now*:

For three consecutive years Oklahoma has led the country in composite condition of all crops.

The two chief crops, wheat and cotton, were marketed at peak prices together with a big "carryover" from last year.

The bulk of the wheat crop was marketed at \$1.15 to \$1.20 a bushel. Wheat is lower now, but farmers have none to sell.

Feed and food crops are abundant. Thus, livestock raisers are able to carry their animals through the winter cheaply. Dairy farmers are particularly favored.

Oklahoma's cotton acreage was only one-third as large as in 1920, yet the growers received two-thirds as much money for the crop. Moreover, the entire crop was economically produced with an expectancy of ten-cent cotton. Imagine the change in the farmers' buying attitude when the crop brought 20 to 22 cents.

Nineteen twenty-two will witness a return to full farm prosperity in Oklahoma.

May we send you other convincing facts regarding the Oklahoma farm market for automotive equipment?

THE dawn of 1922 finds Oklahoma one of the best farm markets in the entire country. Farmers of few other states received as near a normal income from their 1921 crops. And the farmers of Oklahoma expect an even closer approach to normal in 1922.

They are optimistic, they have come through the depression successfully. Now they are making plans for purchases and improvements to make 1922 a year of undisputed prosperity.

Farmer-Oklahomans have the money to buy the things they need to make farm life livable and profitable, although they are conservative in their tastes and cautious in making purchases.

To stand the inspection of the farmers of Oklahoma, an automobile must be of known quality, backed by a reliable manufacturer and adapted to the heavy service imposed by farm use. The way to secure their interest in your car is to make known its past performance through the Oklahoma Farmer-Stockman, the farm paper trusted and respected by Oklahomans.

Only after gaining their confidence can *you* be the manufacturer who will sell them the automobiles they need and will buy this spring.

To interested manufacturers we will gladly furnish a complete analysis of the Oklahoma farm market, evidence of conditions, and an authoritative forecast of what 1922 holds for the automotive manufacturer.

# ROLLER BEARINGS

## F r i c t i o n

Friction, from the beginning of time, has controlled man's progress, either as a friend or as an enemy.

Earliest evidence of the friendly use of friction was the rubbing of the hands and body to keep warm and finally the rubbing of a pointed stick to start a fire. But friction, like the fire which it starts, is, in many ways, man's formidable enemy.

In the operation of machinery and in the development of all automotive vehicles, friction must be held absolutely under man's control; or else, the mechanical power which has carried man from savagery to his present high estate, would be so wasted as to hold progress and development at a standstill.

Without anti-friction bearings (as they are called) machinery in general would have remained as in great-grandfather's day. No railroads would streak across the land—no motor cars—no trucks—not even power-driven boats could ply.

In this battle, against "enemy" friction, human inventive genius has progressed rapidly from the early cumbersome types of soft, slippery metal collars which encircled axles and shafts—through various applications of balls and rollers—to the tapered roller bearing of today, as typified in the product of the Timken Roller Bearing Company;—

It has progressed from those early nuisances that required greasing or oiling every few hours to the Timken Tapered Roller Bearing of today that requires attention as infrequently as every year or two.

Here we have a light, compact and self-contained device that is friction's absolute master. For not only do Timken Tapered Roller Bearings hold friction to a negligible minimum—

But in so enabling wheels and shafts to revolve at frightful speeds with ease and safety—

Timken Tapered Roller Bearings, at the same time, carry all the loads that may be thrust upon them regardless of the direction from which these loads may come. No matter how, nor where, nor when that shock or load is applied—

Your Timken Tapered Roller Bearings rest snugly in their various housings, absorbing or deflecting those blows—

The while your motive power is being delivered through these bearings, without interruption, to the driving wheels—

And finally, when that wear which *must* follow all motion becomes apparent,—a simple adjustment and your Timkens function as when new.

## Heat Treating Containers

*Endure in High Temperatures*

**Q**UALITY or ECONOMY—which is of greater importance to you? Pretty hard to say, isn't it? In the final analysis quality and economy are mighty close to twin brothers, and both must be measured in terms of service.

How well the case-hardened part performs its function, on an average, depends on how the various elements in the carbonizing process "average up." Keeping down spoilage and maintaining a fairly accurate uniformity of case, heat after heat, calls for containers that not only give long service but behave in a uniform way throughout their entire usefulness.

From every angle that affects either quality or economy, Cast Nichrome Containers average up to the highest satisfaction point. The proof exists in hundreds of modern plants.

*All Cast Nichrome Containers are

# Nolenz Headlight at the New York Show

**A**T our booths every courtesy will be extended to car and truck engineers, designers and factory heads in general. For their information every detail of reflector design, and other patented features will be thoroughly discussed. All matters relating to special forms of lamp design and finish will also be brought to the attention of those interested.

*See This Exhibit in  
Spaces D-84 and  
D-114*

Nolenz is the final scientific development in road lighting.

It gives even, wide-spread and ample light volume for driving, side and ditch illumination.

It is equipped with a plain cover glass front for reflector and lamp protection only.

It can be aimed at any angle and then securely locked. No bolt breaking wrench is necessary.

Focus adjustment is made by hand screws back of the reflector. This device also locks the precision socket and lamp.

The reflector is made under the Bart patented process and is guaranteed for three years against tarnish and rust.

## Motor Wheel Products

Millions of motor cars and trucks make their way everywhere on wheels manufactured by the Motor Wheel Corporation.

The very forests that grow the wood for these wheels are owned by the Motor Wheel Corporation. This specially selected timber is cut in the Motor Wheel Corporation's own sawmills; and seasoned as can only be done with facilities as modern and extensive as those of this virtually self-contained institution

Even the metal parts of these wheels come from the noted Gier Stamping plant of the Motor Wheel Corporation

—where Gier Tuarc Steel Wheels also are made

—and where are made the metal stampings

which improve, strengthen and lighten millions of cars and trucks.

These immense facilities, controlled at first hand, plus wheel and stamping experience which began with the industry itself, are responsible for the *high character* of the wheels made by the Motor Wheel Corporation.

These things mean wheels with rugged strength and ability to serve year after year with hardly any care or thought from the owner or driver

—wheels which despite their strenuous task, commonly outlive the car or truck on which they were first installed.

Wheels of such supreme excellence are a credit to the car or truck on which you find them—an asset worth looking for.

**MOTOR WHEEL CORPORATION, LANSING, MICHIGAN**

Motor Vehicle Wheels Complete

Organizations and individuals capable of handling whole-sale distribution of Gier Tuarc Wheels are invited to make application for exclusive territory assignment

# PASSENGER CAR "SIX" Beaver

## Quality Power Plants

The most important unit in an automobile is its motor.

It is the index to the car's character. It determines, more than anything else, the reputation the car will have with the buying public.

A fine automobile must have a fine motor.

Beaver Engines are built to be fitting power plants for the finest motor cars. They give the smooth-flowing tremendous power that is so necessary. They are of the valve-in-head type with the faults found in less carefully built motors of this type eliminated.

The Beaver model C.L.  $3\frac{1}{2} \times 5\frac{1}{4}$  shown below is especially adapted to cars of 3500 pounds or over. It develops 60 hp. at 2000 r.p.m.

We shall be happy to send you detailed technical description.

### BEAVER MANUFACTURING CO.

First and Oklahoma Avenues

Milwaukee, Wis.

*Truck owners throughout America are proving, over and over again, that the Torbensen Axle improves truck performance, lengthens truck life, and lowers truck costs. By making the final gear reductions at the wheels, the Torbensen Axle increases driving power, and thus lightens the load on the motor. It is the lightest weight, yet the strongest axle for a given capacity. This means an important saving in the dead weight that must be carried beneath the springs, and makes for longer truck life, and greater tire mileage.*

# TORBENSEN AXLES

CLEVELAND, OHIO

De Luxe  
Model

The Stewart Warn-O-Meter  
"It Warns in Time"

Installed on  
RadiatorSpecial Monogram  
Design in side  
Facing On-coming  
Cars

# The Warn-O-Meter

**Warns of an overheating motor. Operated directly from motor.**

The Warn-O-Meter can be installed on radiator, fender or hood. It is not a mercurial device. Has nothing to do with the water in radiator. Is not directly effected by weather conditions.

It warns the driver when the motor's heat is nearing a danger point. In order to do this accurately it is operated *directly from the motor*.

When the motor is cold no light shows in the Warn-O-Meter. At normal, efficient temperature a green light appears. If the motor begins to overheat the green gradually changes to a brilliant red.

Overheating will do serious damage to a motor if not checked. The Warn-O-Meter will save the motorist many repair bills.

It is not only practical but very attractive. In the side of the instrument, facing oncoming cars, there is a colored design which may be replaced if desired by a car nameplate, trade-mark, owner's monogram, etc. Illuminated by the light within the Warn-O-Meter.

The De Luxe Model, beautifully finished in nickel—\$12.50.

The Standard Model, with standard finish of black enamel and nickel,—\$10.00.

The Ford Model, given standard finish and furnished complete with radiator cap—\$10.00.

Write for free attractive booklet giving complete information on operation.

#### MINIMIZING REPAIRS

The new models of WRIGHT engines have thicker cylinder sleeve heads and increased cooling around the valves. This has stopped valve warping. From 200 to 300 hours may be expected without regrinding valves. A new device makes engine timing an easy operation.

FROM now on all WRIGHT engines will have this nameplate on the hub. This is a visible guarantee to all who fly with the engine that it was made by us in our own plant. This plate certifies that every ounce of material was critically examined, then machined by our own experienced men to exact gauge and carefully assembled. The nameplate guarantees the engine has passed our exacting running test requirements. While we are building aircraft engines this vigilance will never be relaxed.

*The seven absolute requirements for aircraft engines are fulfilled in the two models of Wright engines now in production and being sold.*

#### ENGINE REQUIREMENTS

1. Lightness per horsepower
2. High power
3. Low fuel consumption
4. Short overall length
5. Interchangeable parts
6. Longevity
7. Reliability

#### RESULT IN PLANE OPERATION

Greater useful load, increased performance.  
Speed, climb, power reserve.  
Economy, long travel radius, increased useful load.  
Increased manoeuvrability, compact installation.  
No long repair periods, economy, safety.  
Many WRIGHT engines built four years ago are still flying. Many have flown 1,000 hours and over. With the E-2 and H-2 engines incorporating changes based on actual experience from hundreds of our own engines, we advise commercial flyers to figure on ultimate life of 2,000 hours.  
The reliable WRIGHT engines safeguard the life of the flyers thru exacting quality and test requirements. Skill, experience and unrelaxing vigilance make these engines the most reliable in the world.

*Compare the characteristics of these stock engines now in production with any engine built—foreign or domestic.*

## NOISELESS TIMING GEARS

Most timing gears are made of metal. Metal gears are noisy. Some motor car makers use chains. Chains stretch and rattle. But you can have silent timing gears—waterproof, vulcanized fibre gears that will serve you better than metal gears or chains.

## CONDENSITE CELORON Silent Timing Gears

replace noisy gears and rattling chains with silent performance. These gears mesh without noise because they are non-metallic. They eliminate the grind or rattle of metal upon metal. They cushion the shock of gear upon gear and help lengthen the life of every part of your engine. They never crystallize and always give service because they are highly resilient—able to absorb sudden shock or strain.

In short, Condensite Celoron timing gears are both trouble and fool-proof. Request them on your next car, or have them installed now on your present one. Ask your local car dealer or any authorized service station. If they can't help you write us direct.

LAKEWOOD METHODS AND MACHINES

**VUL-COT Fibre**

## For All Insulation Vul-Cot Fibre

*Machines as readily  
as lead*

VUL-COT Fibre comes in sheets, rods and tubes. It's dense and tough and has an extremely low friction co-efficient. This gives it the greatest wear resistance of any insulator.

VUL-COT Fibre is always uniform — never contains fissures, hard or soft spots, grit or other foreign matter. Edge tools used in machining it are subjected to little wear. Here are the physical properties of VUL-COT Fibre:

Tensile strength, 9,000 to 14,000 pounds per square inch — compressive strength, 32,000 to 67,000 pounds per square inch — Resistance to shearing, 9,000 to 13,000 pounds per square inch — Specific Gravity, 1.2 to 1.5. Electrical rupture, 100 to 400 volts per mil.

—And these are the properties that have made VUL-COT Fibre "The Material with a Million Uses." We have a book bearing this title. We'll send it: Tell us where. Also consult the VUL-COT Service Dept. in your individual problems.

## The Universal Cleaner

*Is rapidly displacing the many cleaners that lack in one or more of the good qualities that are all found in this perfect compound. These qualities are positive action, speed of operation, long life, non-tarnishing, easy rinsing, safety to skin and clothing, economy.*

### MAKE THE TEST

Esco will prove itself as a quick, thorough cleanser.

Esco, a scientific combination of minerals, dissolves and emulsifies oil, grease and dirt.

### ESCO CLEANS ALL GOODS ALL RIGHT

Prove these claims — Send for generous sample. Specify if you clean Aluminum or Britannia.

## Are Your Service Stations Spreading the Gospel of Quality Repairs?

After the motor car leaves the factory and gets into the every-day hard grind, maintenance is of prime import. The car of your handiwork must rise or fall on the kind of overhaul it receives.

Service stations equipped to grind cylinders, grind motor parts—crankshaft, piston pins, valve stems, etc.—turn out quality repairs. No fear of faulty results from accurate work intelligently performed.

Spread the gospel of *quality repairs* to your service stations. Influence for the good, all those dealing in service to cars of your manufacture. Let us help you all we can.

Landis No. 4-A Grinding Machines are practically invaluable in repair shops, garages and small or medium-sized machine shops. They are adapted to all classes of regrinding, whether on crankshaft or transmission gear. When regrinding crankshaft, adjusting blocks, bushings and throw blocks are unnecessary—universal chucks hold the work with that firmness essential to accurate work. Adjustments are easily made—a crankshaft can be aligned and ready for grinding in two minutes.

# BAKELITE

Reg. U. S. Pat Off.

## Transparent Fountain Pens

A fountain pen is one of the most perpetually abused of personal possessions. Bitten, chewed, dropped, stepped on, heated by the body, attacked by ink-chemicals, sworn at for unexpectedly going dry—it receives a great deal of "punishment."

Bakelite becomes the ideal material for fountain pen barrels. The advantages of its transparency in exhibiting the state of the ink-supply, and in attractiveness, are obvious. The barrel of Bakelite holds a high lustre, resists ink-chemicals and perspiration, is light in weight, agreeable to the touch, non-inflammable, and of unusual mechanical strength.

Have you a product that might be improved by these or other characteristics of Bakelite?

**GENERAL BAKELITE COMPANY**  
TWO RECTOR ST., NEW YORK, N. Y.

We welcome inquiries from manufacturers and maintain a research laboratory for the working out of new applications.

3021-B

## Oakite the Only Cleaner That Could Replace Kerosene

**K**EROSENE meant a high insurance rate, and objectionable working conditions.

So every effort was made by a large metal working plant to find a cleaner that would do the work even with the fair satisfaction given by kerosene. Many cleaners were tried, but no success was had.

One day an Oakite Service Man was given a chance to work out the problem. After a few adjustments in cleaning methods, and the introduction of the proper Oakite formula, the shop foreman reported that Oakite did the work better than anything they had ever used in the past.

Oakite was given steady employment in this plant because it was found after repeated tests, to be the only cleaner that is better than kerosene for removing oil from cold-rolled steel before annealing.

Our Booklet "Modern Metal Cleaning" will help you to determine what Oakite can do to save time, labor or money for you in your cleaning work. Write for this booklet today.

**OAKLEY CHEMICAL CO.**

IN PLANNING A CAMPAIGN, does an advertiser guess at the quality of the  
art work? Does he guess whether the copy to be used is a true representation of his goods?  
Does he guess at the charges of the photo-engraver and electrotypist?  
Then why guess at the circulation of the publications to be used, how that circula-  
tion is obtained, where the papers go, how many paid for, how many given  
away and how many subscribers in arrears?  
These points are vital to the success of the campaign.  
It is not necessary to guess. Any publication that is worthy of the advertiser's  
consideration will give him complete data verified by the Audit Bureau of  
Circulations.
